The paper presents the methodology used in AGUSTA to investigate the Ground Resonance problem. The following three phases of the methodology are considered: design definition, analytical/experimental stage, and ground resonance tests. Emphasis is placed on the second phase, with a description given of the ground vibration tests and their results for the experimental part, the two computer codes used with results, and comparisons between them for the analytical part. For the third phase, the initial results of ground resonance tests are shown, and the procedure for the analysis of the signals obtained from these tests is described. All the results and the data of the work refer to the new AGUSTA 129, so they are not complete as the helicopter is still in the prototype phase. Author

### NONLINEAR ANALYSIS FOR DYNAMIC BEHAVIOURS OF A COUPLED ROTATIONAL VIBRATION SYSTEM NEAR ITS CRITICAL SPEED

T. NAGASHIMA and Y. KATO (Defense Academy, Yokosuka, Japan) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 18 p. refs

From a viewpoint of the nonlinear mechanics, theoretical analyses for dynamic behaviors of an unbalanced rotor near its critical speed are carried out, with emphasis on the variation of rotor speed. A numerical method to construct solutions of autonomous, nonlinear, two-degrees-of-freedom differential equations as trajectories upon the reduced phase plane is proposed. It is understood that basic features of dynamic behaviors near the critical speed should be attributed to properties of pumping phenomena, the relaxational energy transformation between rotational and translational motions. Periodic solutions existing in this nonlinear system are determined numerically by the single and the multiple closed trajectories which could be referred as the specified space filling curves in ergodic space. Analytical approaches utilizing the Fourier expansion method are also presented and dependencies of periodic solutions on their initial conditions as well as the nonlinearity parameter are clarified. The existence of another kind of periodic solutions is suggested with relation to the diverged trajectories where the rotational motion of unbalanced rotor is degenerated to the reciprocating one. ### HOVER TEST OF A FULL-SCALE HINGELESS ROTOR

W. WARMBRODT and R. L. PETERSON (NASA, Ames Research Center, Moffett Field, CA) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 24 p. Previously announced in STAR as N84-33401. refs

The performance and aeroelastic stability in hover of a 9.8-m diameter, hingeless helicopter rotor system was evaluated. Rotor performance and inplane damping data were obtained for rotor operation between 350 and 425 rpm for thrust coefficients (CT/sigma) between 0.0 and 0.12. At constant rotor thrust, a minimum in rotor inplane damping was measured at 400 rpm. Good agreement is shown between experimental performance data and predicted performance. The influence of different aerodynamic inflow models on predicting damping levels is also shown. The best correlation with experimental stability data was obtained when a dynamic inflow model was used instead of static or quasistatic inflow models. Comparison with other full scale, hingeless rotor data in hover is presented. The hingeless rotor data and data from a full scale, bearingless main rotor test performed on the same general purpose test apparatus were compared. Although the bearingless rotor was more highly damped at design tip speed and 1-g thrust operation, greater sensitivity to operating conditions is shown. At low thrust levels the bearingless main rotor is less damped than the hingeless rotor. E.A.K.

### STUDIES OF ROTORCRAFT AGILITY AND MANEUVERABILITY

H. C. CURTISS, JR. (Princeton University, NJ) and G. PRICE (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 22 p. refs

Current rotorcraft maneuverability models are derived from high speed fixed-wing simulations and do not accurately represent the unique maneuvers or limits associated with rotorcraft. Two simplified rotorcraft models are derived which are valid at low speeds and in uncoordinated flight and can be used to examine some of the fundamental aspects of maneuverability and agility. The approach taken is to separate the total induced power and propulsive power above that for steady level flight from the usual expression for total power required. The sum of the induced and propulsive power is then expressed in terms of the horizontal and vertical accelerations in the maneuvering state. Maneuver limits can then be calculated in terms of vehicle design parameters. At low speeds, the attainable levels of acceleration, deceleration, climb, and load factor depend on available control power, control rates, and pilot limits as well as installed power. Because of the direct connection between body attitude and acceleration, it is suggested that an auxiliary thruster would increase vehicle agility, especially at low speeds. Author

### A COMPUTER BASED STUDY OF HELICOPTER AGILITY, INCLUDING THE INFLUENCE OF AN ACTIVE TAILPLANE

S. HOUSTON and A. E. CALDWELL (Glasgow, University, Scotland) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 18 p. refs

A computer-based study of combat-helicopter agility in longitudinal maneuvers is presented, comparing the agility ratings of four helicopters with the same stiff-flapwise rotor and speed (185 km/hr), but different horizontal tailplane configurations. Agility is quantified by the geometry of the maneuver and the time taken to perform it, subject to the limiting hub moment. Vehicle equations solved using an inverse method determined that the helicopter with a controllable tailplane, as the most agile, could fly bobups to 50 m up to 10 percent more quickly than the fixed-tail/least agile one, and hence required less airspace to maneuver. Because the control law is a function of the three tail rotor controls and the pitch rate, it is suggested that such a tailplane would need to be actively controlled, and an integrated element of the helicopter flight control system. ### ELECTPICAL CONNECTIONS AND ANTENNA PERFORMANCE OF A LARGE COMPOSITE FUSELAGE MODULE IN THE HIGH FREQUENCY RANGE

M. J. HESELTINE and W. G. BOUGHTON (Westland Helicopters, Ltd., Yeovil, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 14 p.

The utilization of carbon fiber composites in the design of airframes presents certain problems from an electrical point of view. The present paper is concerned with investigations which were conducted with respect to these problems, taking into account comparative measurements undertaken with an HF antenna fitted to an equivalent metal structure and subsequently onto an Advanced Technology Fuselage (ATF). It was found that an HF antenna mounted on a carbon fiber ground plane exhibits greater losses than the same antenna mounted on a similar sized metal ground plane at frequencies in the range from 2 MHz and 30 MHz, taking into account the use of low current measurement techniques. G.R.

### A REVIEW OF RAE EXPERIMENTAL TECHNIQUES FOR ROTOR DYNAMICS AND AERODYNAMICS

F. B. MOULANG (Royal Aircraft Establishment, Bedford, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 18 p. refs

The development of RAE in-flight experimental techniques for flight research into the detailed aerodynamics, blade motion, structural loading, and temperature distribution of helicopter rotors is reviewed, with emphasis on the most recent employment of data acquisition systems. Main rotor blade modification procedures for mounting strain gages and pressure sensors (stressing the 'glove' technique), in addition to their requirements for flight safety and airworthiness, are discussed. The signal conditioning circuitry uses multichannel slip ring assemblies to supply power to the rotor head and address the sensor amplifiers. The introduction of digital magnetic tape as the prime recording medium alloys data acquisition at a high rate as required by the rotor dynamics. The development of DATAMAP, allowing the generation of a wide variety of display formats, will make possible the direct comparison of measured and predicted data. A special chamber was constructed for the calibration of the large number of sensors involved. R.R.

### TESTS ON A NEW DYNAMICALLY SCALED MODEL ROTOR IN THE RAE 24 FT WIND TUNNEL

J. T. CANSDALE, R. J. MARSHALL, and P. A. THOMPSON (Royal Aircraft Establishment, Farnborough, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 19 p. refs

A new dynamically scaled rotor has been developed for the RAE model rotor rig in the 24ft Wind Tunnel. Two trials have been conducted during 1983, with the aim of acquiring experimental data for validation of loads prediction methods and guiding their further development. Major features of the 3.6 m diameter rotor are the composite blades with RAE 9642 section and built-in twist, and the dual load path hub. The latter is readily adaptable to allow variation of basic design parameters. The design and development of the rotor system is described, together with other new experimental equipment such as the data acquisition system. The trials are summarised, and a selection of results are presented covering loads measured in both the primary and secondary load path components. Comparable theoretical predictions are presented and discussed. Plans for further developments of the test facility and the rotor itself are outlined. Author

### DESIGN AND TESTING OF A LARGE SCALE HELICOPTER FUSELAGE MODEL IN THE RAE 5 METRE PRESSURIZED WIND TUNNEL

F. T. WILSON (Westland Helicopters, Ltd., Yeovil, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 16 p.

The design and preliminary results of a helicopter fuselage wind tunnel experiment to study the influence of Reynolds number on a number of important airframe aerodynamics parameters are discussed. High Reynolds number testing has been identified as a requirement to optimize aerodynamic design and minimize drag for future helicopter designs. A versatile helicopter-airframe-test rig was built to support the various large-scale fuselage and cowl shapes to be tested, and to provide a means to measure rotor head forces and moments. Preliminary small-scale low Reynolds number tests determined the optimum configuration for the study, which used a 5/16 scale in a 5 m wind tunnel over a range of Reynolds numbers from 2.46 times 10 to the 6th per meter, to 17.44 times 10 to the 6th per meter. An RTM 322 engine and a gearbox size no greater than that of the W30 were assumed, and a rigid five bladed rotor head was used for this first test. No unexpected Reynolds number effects on fuselage/cowl longitudinal characteristics were noted, but large changes in rotor head drag with Reynolds number, and some 'critical' drag changes were observed. R.R.

### TESTS ON WHOLE A129 ENGINE BAY SIMULATING THE INERTIA AND AERODYNAMIC LOADS

G. GODIO (Costruzioni Aeronautiche Giovanni Agusta S.p.A., Gallarate, Italy) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 11 p.

These experimental tests are conducted to verify the safety of engine bay of the A129 helicopter in the event of fire. The importance of loads application during the tests are fundamental, because they allow the integrity of engine bay and underlying frame to be checked under actual flight conditions during fire hazard. The inertia loads simulation is carried out with hydraulic cylinders, while the aerodynamic loads are simulated with fans. The engine inlet and outlet are simulated with air flow. The tests are conducted with diffuse flame to verify the engine bay capability to contain the flame and with concentrate flame to verify the strength of installation parts under load. These results make it possible to warranty the safety of engine installation under all fire conditions and to optimize traditional and new materials. Author

### SIMULATION CONCEPTS AND TESTING OF THE TAIL ROTOR FLY-BY-WIRE SYSTEM OF THE A129 HELICOPTER

M. ZAVA and G. MARIANI (Costruzioni Aeronautiche Giovanni Agusta S.p.A., Gallarate, Italy) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 18 p.

Attention is given to simulation concepts developed for the A129 antitank helicopter's fly-by-wire tail rotor system, and to the importance of its interconnection with the redundancy management capabilities of the A129's Integrated Multiplex System. The simulation focuses on system responses to both hydraulic and electronic failures; the software and hardware employed in the simulation testing process are noted, with emphasis on features dedicated to failure simulation. The results obtained are subjected to critical evaluation. O.C.

**TOMORROW . . . CONCORDE'S SUCCESSOR?**
G. CORMERY (Aerospatiale, Division Avions, Paris, France) and G. PATRI Revue Aerospatiale (ISSN 0065-3780), Feb. 1986, p. 10-15. In English and French.

The current state-of-the-art in supersonic transport is discussed along with studies for the development of the Future (second-generation) Supersonic Transport (FSST). Technological advances flight-proven in Concorde's 10 years of commercial experience include full-authority fly-by-wire controls on all three axes and on the engine, digital computers, and an automatic flight management system. Studies for the development of an FSST center on wind-tunnel model testing using the following parameters: Mach 2-2.2, 50 percent aerodynamic, propulsion and weight improvement over the Concorde, an 8000 km/200 passenger profile with 1000 km subsonic flight, the use of existing airport installations, and ICAO A.16.1971 subsonic aircraft noise limitations. The adoption of a variable-cycle engine providing a bypass flow at subsonic regimes and a single flow for supersonic flight will provide the best compromise between general performance and noise limitations. Other projected technologies include the extensive use of the control-configured vehicle concept, permitting flight with zero static margins. R.R.

**EFFECTIVENESS OF FATIGUE LIFE ENHANCING FASTENERS IN THE DESIGN AND REWORK OF AIRCRAFT STRUCTURES Final Report, Feb. 1982 - Feb. 1985**
P. A. KOZEL 28 Feb. 1985 31 p
(Contract F41-420)
(AD-A159676; NADC-85112-60) Avail: NTIS HC A03/MF A01 CSCL 13E

Fatigue life data were obtained for four different types of fatigue life enhancing (FLE) fasteners installed in new uncracked holes and in reworked, pre-cracked holes. The first condition represented a new design where the FLE fasteners are installed during production. The second condition represented a structural rework in which fastener holes are reamed to a larger size to remove fatigue or fretting damage but might still contain a small undetected crack. Results showed that the FLE fasteners produced approximately the same overall fatigue life in the new design and the rework condition and provided a significant increase in life compared to conventional non-FLE fasteners. Tests were performed with 7075-T6 aluminum alloy under spectrum loading typical of a Navy fighter/attack type of aircraft. For the rework condition, the pre-crack size was limited to .03 inch (.76mm). Flush head fasteners were used in all tests. GRA

**EFFECTS OF BLADE-TO-BLADE DISSIMILARITIES ON ROTOR-BODY LEAD-LAG DYNAMICS**
M. J. MCNULTY 1985 29 p
(AD-A160497) Avail: NTIS HC A03/MF A01 CSCL 01C

Small blade-to-blade property differences are investigated to determine their effects on the behavior of a simple rotor-body system. An analytical approach is used which emphasizes the significance of these effects from the experimental point of view. It is found that the primary effect of blade-to-blade dissimilarities is the appearance of additional peaks in the frequency spectrum which are separated from the conventional response modes by multiples of the rotor speed. These additional responses are potential experimental problems because when they occur near a mode of interest they act as contaminant frequencies which can make damping measurements difficult. The effects of increased rotor-body coupling and a rotor shaft degree of freedom act to improve the situation by altering the frequency separation of the modes. Author (GRA)

**RESONANCE FATIGUE TEST OF THE EMPENNAGE OF A CT4 AIRCRAFT**

I. ANDERSON and L. MOLENT Jun. 1985 36 p

(AD-A160749; ARL/STRUC-TM-412) Avail: NTIS HC A03/MF A01 CSCL 01C

A resonance fatigue test was carried out on the rear fuselage and empennage of a CT4 aircraft. The structure was supported in a reaction frame, and was excited at the resonant frequency of the fuselage torsional mode (9 Hz) by electromagnetic shakers connected to the tailplane. The loading spectrum applied was based on strain sequence data obtained from flight trials. Regular inspections of the structure were carried out, and several areas on the rear fuselage and empennage were identified as being prone to fatigue damage. GRA

**PRELIMINARY AIRWORTHINESS EVALUATION OF THE AH-1S (MODERNIZED COBRA) WITH THE HELLFIRE, TOW, AND STINGER MISSILES INSTALLED Final Report, 17 May - 27 Jul. 1984**

R. MACMULLIN, G. T. DOWNS, E. TAVARES, J. S. LAWRENCE, and L. L. TODD Oct. 1984 188 p

(AD-A160862; USAAEFA-84-11) Avail: NTIS HC A09/MF A01 CSCL 01B

The aircraft was operated at gross weights up to 10,400 lb, up to 11,340 feet density altitude and at a lateral center of gravity (cg) range from one inch right to approximately three inches left. The asymmetric loadings were caused by the various combinations of armament configurations. The change in equivalent flat plate area compared to the clean aircraft for each configuration varied as a function of airspeed. At 130 knots true airspeed (KTAS), the increased flat plate area was 4.2 square feet for the Launcher configuration, 4.8 square feet for the TOW configuration, 6.6 square feet for the Hellfire and Hellfire/TOW configurations, and 7.8 square feet for the Stinger/Hellfire/TOW configuration. The increase in flat plate area for the Stinger/Hellfire/TOW configuration reduced maximum level flight speed for normal rated power by approximatley 8 KTAS. With the exception of the two armament related shortcomings listed below, the handling qualities and the reactions to system failures of the AH-1S (MC) were not significantly changed by the asymmetric loading of the various armament configurations. Four shortcomings were noted and follow in decreasing order of importance: (1) the high left rolling response to a sudden engine failure at power settings above 75% torque; (2) the undesirable maneuvering stability characteristics above 1.4 g's; (3) insufficient left pedal margin available in right sideward flight above 10 knots in the Hellfire and Hellfire/TOW configurations; and (4) insufficient left pedal margin available for ball-centered forward flight below 30 KCAS in the armament configurations with left lateral cf offset. A CAUTION is recommended for inclusion in the operator's manual. GRA

**HOVER AND FORWARD FLIGHT ACOUSTICS AND PERFORMANCE OF A SMALL-SCALE HELICOPTER ROTOR SYSTEM**

C. KITAPLIOGLU and P. SHINODA 13 Sep. 1985 29 p Prepared in cooperation with Army Aviation Research and Development Command, Moffett Field, Calif., and City Univ., London, Engl.
(NASA-TM-88584; NAS 1.15:88584; AD-A160661) Avail: NTIS HC A03/MF A01 CSCL 20A

A 2.1-m diam., 1/6-scale model helicopter main rotor was tested in hover in the test section of the NASA Ames 40- by 80- Foot Wind Tunnel. Subsequently, it was tested in forward flight in the Ames 7- by 10-Foot Wind Tunnel. The primary objective of the tests was to obtain performance and noise data on a small-scale rotor at various thrust coefficients, tip Mach numbers, and, in the later case, various advance ratios, for comparisons with similar existing data on full-scale helicopter rotors. This comparison yielded a preliminary evaluation of the scaling of helicopter rotor performance and acoustic radiation in hover and in forward flight. Correlation between model-scale and full-scale performance and acoustics was quite good in hover. In forward flight, however, there were significant differences in both performance and acoustic characteristics. A secondary objective was to contribute to a data base that will permit the estimation of facility effects on acoustic testing. GRA

**AERODYNAMICS OF TWO-DIMENSIONAL BLADE-VORTEX INTERACTION**

G. R. SRINIVASAN, W. J. MCCROSKEY, and J. D. BAEDER 1985 20 p Previously announced in IAA as A85-40685
(Contract DAAG29-85-C-0002)
(AD-A160662) Avail: NTIS HC A02/MF A01 CSCL 01C

A computational procedure and some numerical results of unsteady interaction of a helicopter rotor blade with a Lamb-like vortex of finite viscous core in subsonic and transonic flows is presented. The interaction considered here is one of the limiting cases of a more complex interaction typically encountered on helicopter rotor blade. In this limit, the interacting flow field is considered to be unsteady but two-dimensional. Accordingly, unsteady, two-dimensional, thin-layer Navier-Stokes equations are solved using a prescribed-vortex method (also called perturbation method) for the cases of stationary and moving rotor blades encountering a moving vortex passing the blades. The numerical results are compared with the recent experimental data of Caradonna et al. for the latter case. The comparison shows that for the transonic cases, the flow field is dominated by the presence of the shock waves, with strong indications of unsteady time lags in the shock-wave motions and shock-wave strengths, and of important three-dimensional effects. For subcritical-flow cases, however, the unsteady lag effects on the basic rotor blade are absent, and three-dimensional effects appear to be negligible, unlike the supercritical case. The subcritical calculations are in good agreement with the experimental data. GRA

**CORRELATION OF RESULTS OF AN OH-58A HELICOPTER COMPOSITE TAIL BOOM TEST WITH A FINITE ELEMENT MODEL**

N. CALAPODAS and K. HOFF Sep. 1985 32 p
(Contract DA PROJ. 1L1-62209-AH-76)
(AD-A161062; USAAVSCOM-TR-85-D-15) Avail: NTIS HC A03/MF A01 CSCL 01C

The results of testing an OH-58A composite tail boom and comparing its static and dynamic characteristics with those obtained from finite element analyses are presented in this report. Static load versus deflection data were used to verify the stiffness representation of the finite element model. Ground vibration test data were used to evaluate frequency and modal responses obtained from analysis. Discussions of each test configuration, including data analysis methodology and correlation results, are presented. Differences between measured static deflections and finite element analysis calculated deflections range from 6 to 12 percent. Natural frequency differences between test and analysis were less than 5 percent for the first and second elastic modes. Problems encountered during the testing and the impact on correlation are also discussed. GRA

**FLIGHT TEST EVALUATION OF THE NETHERLANDS FLIGHT INSPECTION AIRCRAFT**

D. GEELS 14 May 1984 43 p refs Presented at 3rd International Flight Inspection Meeting, Ottawa, Ontario 28 May-1 Jun. 1984
(NLR-MP-84052-U; B8571448) Avail: NTIS HC A03/MF A01

Flight test evaluation of a flight inspection aircraft (Cessna Citation 500) equipped with position sensors, calibrated navaids receivers and a fully automatic data acquisition and data processing system for the real-time calibration and inspection of radionavigation and instrument landing systems was carried out. For the evaluation and acceptance of the en-route part of the system, a small, light-weight flexible data acquisition system was installed. Using a specially developed software package, high accuracy position reference data was computed off-line to demonstrate the CFIS navaids en route calibration performance and to determine the overall navigation accuracy of the flight inspection and navigation system during the calibration flights. The distance measuring equipment position reference method, the function and the operational principle of the flight inspection system, additional test equipment, and the data processing are described. **IMPROVING COMMERCIAL AIRCRAFT TRAINING SIMULATORS**

V. GORYACHEV *In its* USSR Report: Life Sciences. Biomedical and Behavioral Sciences (JPRS-UBB-86-001) p 48-49 2 Jan. 1986 Transl. into ENGLISH from Vozdushnyy Transport (Moscow, USSR), 10 Sep. 1985 p 3
Avail: NTIS HC A06

Studies of the use of technical means of instruction was begun in 1976. Results of this research indicated that training with simulators could take the place of flight training of crews in preparation for spring and summer flight operations. Instructions from the Ministry of Civil Aviation to this effect were issued in 1977. This change has proved effective. Effective use of comprehensive training simulators has become an important way of saving fuel. Flight training in flight schools still takes up a large portion of their time, the benefit yielded by helicopter training simulators still is not large enough, and possibilities exist for reducing unproductive flight time in a whole series of training programs for flight crews. **ADVANCED MEDIUM SCALE REAL-TIME SYSTEM**
A. L. KELLEY (Fairchild Weston Systems, Inc., Data Systems Div., Sarasota, FL) IN: European Telemetry Conference, 7th, Boeblingen, West Germany, May 21-24, 1984, Reports. Part 2 . Wessling, West Germany, Arbeitskreis Telemetrie, 1984, p. 7.1-7.1.16.

In 1960, the U.S. Army Aviation Engineering Flight Activity (USAAEFA) was formed to perform flight test evaluations of Army aircraft. In 1977, the USAAEFA initiated an investigation regarding the feasiblity of replacing the previous system because of age and lack of growth potential. With respect to the selection of a replacement system, an architecture was to be chosen which would not utilize hardware or software capabilities considered to be 'pushing the state-of-the-art'. Attention is given to the definition of an optimum system, questions of engineering interaction, the man-machine interface, a system description, the telemetry acquisition subsystem, the preprocessing system, the computer system, the operating system, the setup and application software, and a data flow overview. G.R.

**THE DATA TRANSMISSION AND PROCESSING EQUIPMENT OF A HIGH-PRECISION TRAJECTORY MEASUREMENT SYSTEM [DIE DATENUEBERTRAGUNGS- UND -VERARBEITUNGSEINRICHTUNGEN EINES HOCHPRAEZISEN FLUGBAHNVERMESSUNGSSYSTEMS]**
P. SCHULZ (DFVLR, Institut fuer Flugfuehrung, Brunswick, West Germany) IN: European Telemetry Conference, 7th, Boeblingen, West Germany, May 21-24, 1984, Reports. Part 2 . Wessling, West Germany, Arbeitskreis Telemetrie, 1984, p. 8.11-8.11.11. In German.

A measurement system has been designed for the study of approach and landing systems. The aircraft employed for the experiments contains an onboard device of the system to be tested and, in addition, equipment of the measurement system. In ground tests, the aircraft is replaced by a ground test vehicle. On the ground at the airport, the ground stations of the landing system to be studied together with stations of the measurement system are located at suitably selected positions. A suitable system for data processing operations is needed for the conduction of the required flight and ground tests. This data system has to perform functions related to data acquisition and transmission, data processing and storage, and data display. Details regarding the conduction of the required operations are discussed. G.R.

**AIR FORCE FLIGHT TEST INSTRUMENTATION SYSTEM - AN INTRODUCTION FOR FLIGHT TEST ENGINEERS AND MANAGERS**
J. M. POSNER and R. A. KITCHEN (USAF, Flight Test Center, Edwards AFB, CA) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 24-1 to 24-11.

The design and development of the Air Force Flight Test Instrumentation System (AFFTIS) are described. The proposed design of the AFFTIS is a digital modular system with remote sensing multiplex capability and is based on the use of data acquisition units (DAUs). The hardware for the AFFTIS, which includes an AFFTIS system controller, a data bus, a system power supply, DAUs, cockpit data displays, and the Analog-Discrete Data Acquisition Unit, are examined. The Laboratory Support System, Ground Support Unit, and Remote Site Unit are applied to hardware unit testing, software programming for the test configuration formats, and on-aircraft checks of the installed instrumentation hardware. The organizational, intermediate, and depot level maintenances, and the role of the system manager are analyzed. The economical advantages the AFFTIS provides are studied. I.F.

**AIRBORNE RADAR. I - AIR-TO-SURFACE**
J. CLARKE (Royal Signals and Radar Establishment, Malvern, England) and C. M. STEWART (Ferranti, PLC, Edinburgh, Scotland) Microwave Journal (ISSN 0026-2897), vol. 29, Jan. 1986, p. 32, 34, 36 (5 ff.).

Airborne radar has retained its attraction as a sensor, despite the development of alternative technologies. The reasons for this situation are related to the flexibility of radar in adapting to a wide range of operations roles, a relative immunity to weather conditions, and an ability to detect relatively small targets at considerable distances. Recent developments are related to the innovation of powerful, high speed computers suitable for airborne use, and the adoption of coherent radar systems relying on the use of an RF power amplifying tube rather than the self-oscillating magnetron. This paper provides a review of the various classes of airborne radars in the light of the introduction of new capabilities. Attention is given to air-to-surface roles, sea surface reconnaissance, land reconnaissance, close air support and strike, and terrain clearance. G.R.

**A VME BUS MICROCOMPUTER SYSTEM FOR EXPERIMENT CONTROL AND ANALYSIS ON BOARD AN AIRCRAFT**

A. J. DEMPSTER (Wellington, Victoria University, New Zealand) New Zealand Journal of Technology (ISSN 0112-3890), vol. 1, April 1985, p. 53-60. Research supported by the New Zealand Meteorological Service. refs

The severe mechanical environment on board an aircraft requires that special consideration be given to the selection of equipment for experiment control and analysis. In the system described in this paper, the VME bus and Motorola 68000 were chosen. These combine a modern state-of-the-art 16-bit microprocessor with a secure mounting system and a wide range of experiment interfaces configured from standard Eurobus boards. A real-time operating system and applications software were written in the high-level language 'C'. This provides sufficient structure facilities with enough access to machine-level components. With certain safeguards it was possible to place all object code in ROM. All software was developed on a host computer using cross-compiler and cross-assembler. The approach taken was dictated mainly by cost but has met the initial requirements of real-time experiment control and data analysis. Author

**THE UTILITY OF HEAD-UP DISPLAYS - EYE-FOCUS VS DECISION TIMES**

D. J. WEINTRAUB (Michigan, University, Ann Arbor), R. F. HAINES, and R. J. RANDLE (NASA, Ames Research Center, Moffett Field, CA) IN: Human Factors Society, Annual Meeting, 28th, San Antonio, TX, October 22-26, 1984, Proceedings. Volume 1 . Santa Monica, CA, Human Factors Society, 1984, p. 529-533.

Instrument-panel information is presented by a Head-Up Display (HUD) to pilots in such a way that the symbols appear far away (at optical infinity) superimposed upon the landscape. The use of a HUD makes it, therefore, unnecessary for the pilot to take his eyes off the changing scene in order to look down and refocus on the instrument panel. It is pointed out that the HUD has proved superior to the conventional instrument-panel display. An experiment was conducted with the objective to help to determine which of the differences between HUD and conventional instrument-panel display are mainly responsible for the superiority of the HUD. Important features of this experiment are that the format of each virtual-image display, its luminance, and its angle subtended at the eye, remained the same as the optical distance and location were varied. It was found that the HUD symbology at optical infinity does reduce decision times compared to the same format at the location of a conventional instrument panel. G.R.

**A PRELIMINARY FLIGHT EVALUATION OF THE PERIPHERAL VISION DISPLAY USING THE NT-33A AIRCRAFT**

V. GAWRON and L. KNOTTS (Calspan Advanced Technology Center, Buffalo, NY) IN: Human Factors Society, Annual Meeting, 28th, San Antonio, TX, October 22-26, 1984, Proceedings. Volume 1 . Santa Monica, CA, Human Factors Society, 1984, p. 539-541. Research supported by the Department of National Defence of Canada.
(Contract F33615-79-C-3618)

The Malcolm Horizon, a Peripheral Vision Display (PVD), was installed in the NT-33A variable stability research aircraft to provide the evaluation pilot with a gyrostabilized horizon line of red laser light. An experiment was conducted to determine the effect of the PVD on pilot workload. Workload was inferred from performance on a secondary task, in this case the Sternberg task, generated by the Workload Assessment Device (WAD). The primary task required the pilot to maintain airspeed, altitude, and angle of bank during instrument flight conditions. Nine NT-33A flights were flown by two evaluation pilots. Presence of the PVD reduced the WAD reaction times of one of the pilots; the reaction times of the other pilot showed mixed results. Recommendations for future research are presented. Author

**SENSOR SYSTEM CONCEPT FOR FUTURE FIGHTER AND STRIKE AIRCRAFT [KONZEPT EINES SENSORSYSTEMS FUER ZUKUENFTIGE JAGD- UND KAMPFFLUGZEUGE]**

B. STIELER (DFVLR, Institut fuer Flugfuehrung, Brunswick, West Germany) Zeitschrift fuer Flugwissenschaften und Weltraumforschung (ISSN 0342-068X), vol. 9, Nov.-Dec. 1985, p. 339-348. In German. refs

Laser gyro multifunction inertial sensor assemblies (MISA) can be used for navigation, flight control, cockpit instrumentation, and computation of weapon delivery in future fighter and strike aircraft and will contribute to a reduction of an aircraft's life cycle costs. The internal MISA signal processing, which is adapted to increased laser gyro noise, is discussed. The potential for increased MISA navigational accuracy through the use of external sensors is considered, especially for automated terrain-following flight. The increased reliability required in sensor systems of control-configured vehicles will be attained by highly reliable sensors and a skewed montage, as in two MISAs. A special signal processing permits detection and identification of sensor or subsystem failure and the reconfiguration of the remaining system. The failure probability of various system configurations is calculated. C.D.

**DESIGN OF THE F-16 AIRCRAFT ELECTRICAL SYSTEM BUILT-IN-TEST MONITOR**

M. A. ROSSWURM (Cummins Engine Co., Columbus, OH) and L. L. TIPTON (Westinghouse Electric Corp., Electrical Systems Div., Hunt Valley, MD) IN: Intersociety Energy Conversion Engineering Conference, 20th, Miami Beach, FL, August 18-23, 1985, Proceedings. Volume 1 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 1.367-1.373.

Built-In-Test (BIT) capability in aircraft electronic equipment has the potential to reduce maintenance effort and increase aircraft availability. This paper describes a BIT monitoring scheme used on a high performance fighter aircraft to detect and isolate faults in the electrical generation equipment. An overview of the BIT monitor is given, along with a detailed analysis of a typical subsystem BIT equation. The results and method of test for a hardware BIT demonstration are detailed. Some ideas and an example of improving the display of maintenance information by the use of graphic display devices are presented. Finally, some techniques are explored for simplifying the detection and isolation of electrical system faults through the use of remote diagnostic tools. Author

**THE HUD AS A PRIMARY FLIGHT INSTRUMENT**

P. B. LOVERING and . S. ANDES (Midwest Systems Research, Inc., Dayton, OH) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 33-36.
(SAE PAPER 841463)

The usefulness of head-up displays (HUDs) in the modern fighter aircraft is often impaired by the fact that the functions of HUD are not always intuitively obvious, and the HUD descriptions are sometimes confusing or incomplete. The aspects of current display symbology, mechanization schemes, needs, and some possible modifications are discussed. Use of identical terms to describe two different functions, variation in information content across the various HUDs, and use of multiple display formats in altitude and navigation displays are given as examples of inadequacies that diminish the HUD usefulness. The short-term steps suggested for improving the utility of existing HUDs include standardization of all symbols and fundamental display concepts. The long-term steps involve redesigning the HUD systems to make the displays easier to interpret and to use. I.S.

**A86-26007**

**PRESENTATION OF RADAR ALTITUDE INFORMATION ON THE HUD**

L. A. CARR (USAF, Washington, DC) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 37-43. refs
(SAE PAPER 841464)

Radar altimeters are being included in several existing Air Force aircraft. Of these, the A-10, F-15, and the F-16 are also envisioned to perform the night, under the weather attack mission. This mission, coupled with limited available cockpit space and the anticipated high pilot workload has led to a design effort to include the radar altimeter on the HUD. The LANTIRN system offered a key opportunity to accomplish this HUD integration. The design has evolved from pilot opinions through simulation and now flight test. Plans are currently being made to conduct a simulation to make minor changes to the display based on test results to further optimize the display. This radar altimeter design and particularly the way the design has evolved should serve as examples for future efforts. Of particular note is that this display has been designed from the beginning for a specific purpose and is being optimized for its intended operational environment and the pilots who will use it. Author

**A86-26008**

**FLIGHT DECK DISPLAYS FOR MANAGING WIND SHEAR ENCOUNTERS**

R. G. JOPPA and R. K. NICHOLSON (Washington, University, Seattle) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 45-51.
(SAE PAPER 841465)

A concept of a flight energy instrument system is presented in which the rate of energy with respect to air is used to give the pilot a predictive indication of changes in descent rate due to the wind shear during the approach to landing. Rate of change of total energy is measured and compared to vertical speed, the difference being the change of vertical speed if the shear continues. Flight path angles are displayed on an electronic attitude indicator. In addition, a novel airspeed instrument is described which has two needles, one being the regular pointer to show the airspeed, and the other showing the sum of the airspeed plus the rate of change in the airspeed. The needle separation is a measure of the wind shear rate. Separation of turbulence from shear is accomplished by filtering. The two concepts may be implemented with commercially available hardware or by simple computations using an on-board air data system. I.S.

**A86-26010**

**ELECTRONIC DISPLAY OF POWERPLANT PARAMETERS**

D. K. GRAHAM (Boeing Co., Seattle, WA) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 61-67.
(SAE PAPER 841467)

Results of simulator testing of the seven-color CRT displays in the 757/767 Engine Indication and Crew Alert System are discussed. As a result of this evaluation, changes were made in the displays, such as removal of green bands from all gages, introduction of 'boxed' readouts, and format changes. In addition, results from simulator tests of the digital-only testing, done in support of the Standby Engine Indicator are presented. It was concluded that, while the digital-only displays appear to be not as good as the analog-plus-digital displays, their performance is acceptable, and they may have more operational utility than is commonly realized. I.S.

**A86-26012**

**PRESENTATION OF INFORMATION ON MULTIMODE DISPLAYS - ABNORMAL AND EMERGENCY AIRCRAFT OPERATIONS**

G. R. GERSHZOHN (Rockwell International Corp., Pittsburgh, PA) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 75-83.
(SAE PAPER 841494)

The capability of a multimode display system to present data regarding malfunctioning aircraft systems is illustrated. The development of formats for abnormal operations is based on the correspondence between cognitive requirements of the pilot and displayed information. Three different stages of cognitive processing are identified and associated formats are developed. System architecture provides for the display of required information tailored to pilot requirements in identifying, understanding, and solving malfunctions via a simple multimode display interface. Author

**COCKPIT ADVANCES IN BOEING VERTOL COMPANY'S MODEL 360 HELICOPTER**

A. T. SHERBERT (Boeing Vertol Co., Philadelphia, PA) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 237-241.
(SAE PAPER 841629)

The cockpit advances incorporated into the design of an advanced-composite Model 360 technology demonstration helicopter are described. Perhaps the most important feature of the helicopter will be its lighting system, which has been designed to accommodate both the sunlight readable and night vision goggle-compatible modes of operation. An advanced flight control system features an integrated system of six CRT displays and two data entry keyboards, and a multiplexing control display system to interface them and their supporting subsystems. In addition, the head clearance envelope was redesigned to minimize vehicle contour in the cockpit area; the cockpit area was designed to accommodate the 2nd through 98th percentile aviator with a wide range of anthropometric requirements, and the envelope of vision has been improved. I.S.

**A86-26129#**

**CRT DISPLAYS IN MODERN HELICOPTER DATA PRESENTATION**

M. R. DUELL (Westland Helicopters, Ltd., Yeovil, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 23 p.

The use of CRT displays as Electronic Flight Instruments (EFIS) for helicopters, and their adoption for the cockpit designs of Westland's 30-300 and EH101, are discussed. The multicolored, multifunctional CRT display resulting in more efficient use of the instrument panel area, in addition to its capability of displaying Torque and Tacho, Hover, and search pattern information, contributes to a reduction in pilot workload and cost. However, the weight penalty and higher initial cost of the CRT displays can be minimized by the multiple use of displays via careful format definition. Certification of EFIS for civil helicopters requires comparable reliability to the electromechanical instruments it replaces, and a high level of system redundancy. EH101 display function requirements determined the choice of shadowmask CRT displays. The Westland 30-300 will incorporate EFIS into a system with interfaces between avionics and flight instrumentation already defined with possible adaptation. R.R.

**VISUALLY COUPLED EO SYSTEM DEVELOPED FOR THE RAE SEA KING XV371**

I. MANSFELD (Royal Aircraft Establishment, Flight Systems Dept., Farnborough, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 17 p.

This paper describes the development of a visually coupled system (VCS) and its assessment as a piloting and navigational aid for low level night operations. The overall aim is to define the requirements for each component of a VCS. The trials have been carried out using a Sea King helicopter as the trials vehicle, fitted with a rapid acting two degree of freedom platform capable of matching the head motion rates of the pilot. The sensor used on this platform is an Isocon low light TV camera, though an infrared sensor has been fitted for the next stage of trials. Two types of head position tracker have been used, one electromagnetic in principle and the other utilizing infrared light. Flight symbology has been superimposed onto the sensor image and presented to the pilot on a monocular helmet mounted display comprising a miniature CRT and optics. The results of the trials and their implications on the system components are described. The current trials equipment and plans for the next stage of investigations are discussed. Author

**THE HEALTH AND USAGE MONITORING SYSTEM OF THE WESTLAND 30 SERIES 300 HELICOPTER**

D. G. ASTRIDGE and J. D. ROE (Westland, PLC, Helicopter and Hovercraft Group, Yeovil, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 19 p. refs

The design philosophy behind the health and usage monitoring developments on the Westland 30 series of helicopters is discussed including their relevance to the recently published review of helicopter airworthiness (HARP report). The necessity for a comprehensive on-board data processing system such as that described in this paper becomes patently obvious. The functions included in the system related to engines, the transmission, and rotor systems. Experience has been gained with the implementation of many of these functions separately on development and production aircraft. Details are given of the processor, its interfaces, data links, sensors, and data retrieval unit, together with an overview of the development program. Author

**HORIZONTAL DISPLAY FOR VERTICAL FLIGHT: A DIRECTION OF MOTION EXPERIMENT**

E. J. TRUJILLO and S. N. ROSCOE May 1985 48 p
(Contract N00014-81-K-0439)
(AD-A161113; BEL-85-1/ONR-85-1) Avail: NTIS HC A03/MF A01 CSCL 01D

As a part of a research program to investigate advanced concepts for downward and forward-looking integrated displays, an experiment was conducted to determine optimum direction-of-motion relationships for a new way of presenting altitude and vertical rate information superposed on a downward-looking navigation and tactical situation display. Altitude was represented by the size of an octagon that could either dilate or constrict to indicate increasing altitude, and vertical rate was indicated by the outward or inward flow of four rate-field patterns emanating from the center of the display toward the 45, 135, 225, and 315-degree compass positions. The five factors in this experiment were altimeter and vertical rate-field direction of motion, subject ability level, aircraft vertical control order, and vertical flight course. Performance on four vertical flight profiles indicated that the out is up relationship yields superior vertical control, both in terms of control reversals and log RMS tracking precision, whereas the out is down mode results in more accurate control in the horizontal plane. GRA

**A FLIGHT EVALUATION OF A DIGITAL ELECTRONIC ENGINE CONTROL**

A. T. WEBB and D. L. CORSENTINO (USAF, Flight Test Center, Edwards AFB, CA) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 22-1 to 22-7.

A production F100-PW-200 engine incorporating a digital electronic engine control (DEEC) was installed in an F-16 aircraft and evaluated throughout the flight envelope. Aspects of engine operation evaluated included afterburner and dry power throttle transients, airstarts, secondary control mode operation, and maneuvering flight. The F100 DEEC was found to be a significant improvement over the production F100-PW-200. The afterburner envelope was expanded and blowouts and compressor stalls were eliminated. Dry power operation and engine response were comparable to the production engine. Airstart capability was enhanced by an expansion of the airstart envelope of 20 to 25 percent in airspeed. Secondary control mode airstart capability was similar to that in the production engine. Similarity in airstart procedures between primary and secondary mode was a major advantage. Secondary mode engine operation was generally satisfactory. Author

### AIRCRAFT FUEL PUMP DESIGN

U. S. ROHATGI (Brookhaven National Laboratory, Upton, NY) IN: Design methods for two-phase flow in turbomachinery; Proceedings of the Mechanics Conference, Albuquerque, NM, June 24-26, 1985. New York, American Society of Mechanical Engineers (Fluid Engineering Symposia Series. FED Volume 26), 1985, p. 1-5. refs

A need to pump a mixture of two-phase fluid appears naturally in many situations. One example of this situation is aircraft fuel systems, where the pump inlet may have two-phase mixture due to the desorption of the dissolved gases at low pressures at higher altitudes. A procedure of selecting proper design conditions for the inlet inducer and a method of sizing the inducer, impeller and volute to meet all the design requirements has been described. This procedure has also been applied to a typical fighter plane boost pump design. Author

### DIGITAL CONTROL FOR ENGINE BLEED AIR

D. J. WIEMER (Sundstrand Aviation Mechanical, Rockford, IL) AIAA, SAE, ASME, AIChE, and ASMA, Intersociety Conference on Environmental Systems, 15th, San Francisco, CA, July 15-17, 1985. 11 p.
(SAE PAPER 851316)

As modern control systems become more demanding and complex and the optimum control algorithm becomes more elusive, it becomes obvious that the versatility of control algorithm construction and modification in software is far superior to analog circuit implementations. A digital microprocessor based electronic control system has been developed for temperature control of engine bleed air on the B-1B bomber. The Engine Bleed Air Control System (EBACS) provides pressurized, temperature controlled air to various subsystems on the aircraft. This paper addresses the unique approach used in controlling a bleed air system having major gain variations (over 500 to 1) and major system-element time-constant variations (over 5 to 1) within the flight envelope, while still maintaining specified response times and stablity margins. ### THE EFFECT OF THE VELOCITY PROFILE AT THE DIFFUSER INLET ON THE FLOW PATTERN [VLIIANIE PROFILIA SKOROSTI NA VKHODE V DIFFUZOR NA KARTINU TECHENIIA]

A. M. TURILOV and G. M. SHALAEV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 3, 1985, p. 70-74. In Russian. refs

Results of an experimental study of flow structure in the diffuser of a gas-turbine engine are presented for various types of nonuniform velocity profiles at the diffuser inlet. The changes in the mean and maximum jet characteristics along the diffuser length are examined. Results are presented in graphic form. V.L.

**A86-23670**

### EMISSION CHARACTERISTICS OF A SECTION OF THE COMBUSTION CHAMBER OF A GAS-TURBINE ENGINE WITH VARIOUS MODIFICATIONS OF THE BURNERS [EMISSIONNYE KHARAKTERISTIKI OTSEKA KAMERY SGORANIIA GTD S RAZLICHNYMI MODIFIKATSIIAMI GORELOCHNYKH USTROISTV]

F. M. VALIEV, A. V. TALANTOV, and V. A. SHCHUKIN Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 3, 1985, p. 91, 92. In Russian.

The paper reports the results of an experimental study of the emission characteristics of a 9-burner section of the combustion chamber of a gas-turbine engine. Results are reported for experimental and standard burners which differ in the method of air-fuel mixture preparation. It is shown that the use of experimental burners producing a mixture of prevaporized fuel partially mixed with air that is fed together with secondary air results in a decrease in HC and CO emission over the full range of stable combustion, with a certain increase in NO(x). In the case of lean mixtures, the use of the experimental burners improves the emission characteristics for all toxic gases. V.L.

### DIAGNOSTIC METHODS FOR GAS-TURBINE AIRCRAFT POWERPLANTS [DIAGNOSTICKE METODY LETECKYCH TURBINOVYCH JEDNOTEK]

S. SOUKUP Zpravodaj VZLU (ISSN 0044-5355), no. 3, 1985, p. 147-149. In Czech.

The potential of advanced in situ diagnostic techniques for increasing the reliability of gas-turbine aircraft powerplants is examined. The currently used diagnostic techniques are reviewed, with particular attention given to the continuous monitoring and recording of the operating parameters of the powerplant in flight. The prospects for adopting this approach for local commercial airlines is discussed. V.L.

**A86-23752**

### DETERMINATION OF DIAGNOSTIC PARAMETERS FOR THE IN SITU DIAGNOSTICS OF THE AIR-GAS PATH OF THE AI-25TL ENGINE [STANOVENIE DIAGNOSTICKYCH PARAMETROV PRE BEZDEMONTAZNU DIAGNOSTIKU VZDUCHO-PLYNOVEHO TRAKTU MOTORA AI 25 TL]

J. DULENCIN Zpravodaj VZLU (ISSN 0044-5355), no. 3, 1985, p. 151-156. In Slovak. refs

An approach is proposed for selecting diagnostic parameters for the in situ diagnostics of the air-gas path of the AI25TL jet engine. Use is made of tables of coefficients describing the effect of independent parameters on the dependent characteristics; also, a procedure for diagnosing the engine condition on the basis of the measured independent parameters is detailed. Finally, tables are presented for verifying the calculated coefficients against the measured parameters and simulated faults. V.L.

**A86-23753**

### SOUND GENERATION BY AN ENERGETICALLY INHOMOGENEOUS GAS FLOW IN A GAS-TURBINE AIRCRAFT ENGINE [GENERACE ZVUKU ENERGETICKY NEHOMOGENNIM PROUDEM PLYNU, KTERY PROTEKA TRAKTEM LETECKEHO TURBINOVEHO MOTORU]

F. KOPECKY Zpravodaj VZLU (ISSN 0044-5355), no. 3, 1985, p. 157-160. In Czech. refs

Mathematical models describing sound generation by an energetically inhomogeneous air flow issuing from a model of a gas-turbine aircraft engine into a quiescent ambient medium are examined. An aerodynamic installation is then briefly described which has been built for the experimental determination of the relationship between the degree of flow inhomogeneity and the parameters of the generated sound. V.L.

**A86-23754**

**SIMULATION OF THE VIBRATION TRANSMISSION PATH AND THE USE OF A MATHEMATICAL MODEL OF VIBRATION TRANSMISSION FOR THE VIBRATIONAL DIAGNOSTICS OF AN AIRCRAFT ENGINE [MODELOVANI PRENOSOVE CESTY VIBRACI A VYUZITI MATEMATICKEHO MODELU PRENOSU VIBRACI PRO VIBRODIAGNOSTIKU LETECKEHO MOTORU]**

D. KRENEK Zpravodaj VZLU (ISSN 0044-5355), no. 3, 1985, p. 161-164. In Czech. refs

A simplified model describing vibration transmission in a gas-turbine aircraft engine is presented which is based on the method of the initial flexural vibrations and on solving the motion transmission problem through an expansion in natural vibration modes. A software implementation of the vibration transmission model is briefly described, and some results are presented in the form of diagrams. V.L.

**A86-23756**

**A HOLOGRAPHIC STUDY OF THE VIBRATIONAL MODES OF AIRCRAFT ENGINE ROTORS [HOLOGRAFICKE VYSETROVANI TVARU KMITANI OBEZNYCH KOL LETECKYCH MOTORU]**

K. ANTROPIUS and A. PASLEROVA Zpravodaj VZLU (ISSN 0044-5355), no. 3, 1985, p. 173-177. In Czech. refs

The use of holographic interferometry for investigating the vibrational modes of aircraft engine components in general and rotors in particular is reported. Methods using time-averaged and additional exposures are briefly described; attention is also given to surface preparation procedures prior to holographic measurements and methods of resonance excitation. Sample interferograms of rotors and blades are presented. V.L.

**AN EXPERIMENTAL INVESTIGATION OF RESPONSE OF A TURBOJET ENGINE TO INLET DISTORTION**

F. CHEN, W. LI, Z. WANG, and M. CONG (Northwestern Polytechnical University, Xian, People's Republic of China) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 5 p. refs
(ASME PAPER 85-IGT-12)

A study of the response of a turbojet engine to the steady-state and the turbulence-type dynamic inlet distortion is presented. The steady-state distortion is generated by a 180 deg extent, 36 mesh screen, and the turbulence-type dynamic distortion by a 180 deg extent plate with 50 percent blockage ratio at the engine face. This plate can produce a very strong pressure fluctuation at the engine face. Results from testing show: (1) inlet distortion generated by the screen will produce a classical-surge or deep-surge; (2) the degree of distortion by the screen can change the mode of surge, e.g. from the classical surge to the deep surge and vice versa; (3) both the inlet distortion and the decrease in first-stage-turbine-nozzle area will change the compressor performance maps; (4) the turbulence-type dynamic distortion causes a 'drift-surge'. Author

**A COST-EFFECTIVE PERFORMANCE DEVELOPMENT OF THE PT6A-65 TURBOPROP COMPRESSOR**

T. YOSHINAKA and K. S. THUE (Pratt and Whitney Canada, Aerodynamics Dept., Longueil) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 9 p. refs
(ASME PAPER 85-IGT-41)

The largest member of the PT6 turboprop engine family, the PT6A-65, was developed in the early 1980's and went into production in September 1982. The compressor for this engine consisted of four new axial stages combined with an existing centrifugal stage on a single shaft. This paper gives a brief description of the studies leading up to the choice of the compressor configuration and a more detailed examination of the development of the chosen compressor to the required performance level. The development of this compressor presented a two-fold technical challenge. Firstly, the limited space in the small compressor gas path did not permit the effective use of conventional total pressure and temperature probes for performance evaluation. Secondly, the short time available for development excluded some attractive corrective measures such as the redesign of some of the axial blade rows because the time required would have jeopardized the meeting of the tight development deadline. The first problem was overcome by a combination of limited wall static pressure measurements and an extensive use of numerical flow analysis codes. This approach proved to be quite cost-effective. The second was solved by the adaptation of an existing fully analytically-designed research axial stage to the first stage position in the axial compressor. Author

**OPTIMAL CONTROL CHANGE OF STATE OF AIRCRAFT TURBINE ENGINE**

T.-C. LEE and Y.-S. GUAN (Northwestern Polytechnical University, Xian, People's Republic of China) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 8 p. refs
(ASME PAPER 85-IGT-53)

The paper presents the application of linear quadratic regulator theory to the control of change of state of an aircraft turbine engine from rated to maximum. On the basis of the engine digital simulator, an optimal regulator of change of state is designed. The results of simulation of the optimal control system show that: during transient processes, maximum rotor speed deviation is decreased from 148 rpm to 4.5 rpm, thrust settling time is shortened from 7 seconds to 4 seconds, and transient response of turbine outlet temperature is refined from small overshot to monotonic, as compared with the original hydromechanical control system; thus, the improvement is apparent. Author

**DESIGN APPROACH FOR AN OPTIMUM PROP-FAN PROPULSION SYSTEM**

G. L. BRINES (United Technologies Corp., Pratt and Whitney Div., East Hartford, CT) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 6 p. refs
(ASME PAPER 85-IGT-57)

The predicted potential performance of the Prop-Fan offers a major improvement in the energy efficiency of future, short-range to medium-range transports. This paper describes the approach taken in designing an optimum Prop-Fan propulsion system. Trade-offs in the configuration(s) and performance are discussed, as are the important aspects of integrating the propeller, gearbox, engine, inlet, exhaust, and nacelle. Realizing the impressive potential fuel savings of the Prop-Fan will require very careful engine/airframe integration. Design options that will be compared are: a single-rotation versus counter-rotation arrangement, a tractor versus pusher installation, and wing versus fuselage mounting. In summary, the performance of turbofan powered and Prop-Fan powered, short-haul transports will be compared in detail by using fuel burn, operating costs, and noise as criteria. Author

### STATE OF THE ART IN AIRCRAFT GAS TURBINE TECHNOLOGY

S. R. SAMPL and M. E. SHANK (United Technologies Corp., Engineering Div., East Hartford, CT) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 7 p. refs
(ASME PAPER 85-IGT-87)

The new series of turbofan engines use advanced technology features which enhance their attractiveness through reductions in the cost of ownership, noise, and pollution. Improvements in aerodynamics, mechanics, electronics, and materials technology reduce the cost of ownership via such factors as cost, reliability, durability, and operability. Primarily, advanced technology addresses fuel consumption, a parameter with a very large effect on direct operating cost. In addition, these advances do not trade convenience of operation for environmental acceptability. The advanced technology concepts used in the new commercial aircraft turbine engines offer both economic and environmental benefits. Author

### PREDICTION OF BLADE FLUTTER IN A TUNED ROTOR

J. XU and Z. SONG (Beijing Institute of Aeronautics and Astronautics, People's Republic of China) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 7 p. refs
(ASME PAPER 85-IGT-100)

This paper is about blade flutter in a tuned rotor. With the aid of the combination of the three-dimensional structural finite element method, two-dimensional aerodynamic finite difference method, and strip theory, the quasi-steady models in which two degrees of freedom for a single wing were considered have been extended to multiple degrees of freedom for the whole blade in a tuned rotor. The eigenvalues solved from the blade motion equation have been used to judge whether the system is stable or not. The calculating procedure has been formed and, using it, the first stage rotating blades of a compressor where flutter had occurred, have been predicted. The numerical flutter boundaries are in good agreement with the experimental ones. Author

### FURTHER APPLICATIONS OF THE LUCAS FAN SPRAY FUEL INJECTION COMBUSTION SYSTEM

E. CARR (Lucas Aerospace, Ltd., Combustion Technology and Engineering Centre, Burnley, England) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 8 p.
(ASME PAPER 85-IGT-116)

An evaluation is made of the performance characteristics and design features of fan spray-type gas turbine combustor systems, with attention to a remotely piloted vehicle-engine application with combustion loadings five times greater than those of an initial application of the fan spray configuration. Results of flow visualization, combustion loading over a large air/fuel ratio range, and light-up under a wide range of simulated flight conditions, are presented for a total of six different fan spray combustor configurations. O.C.

**A86-23917#**

### GAS TURBINE COMBUSTION EFFICIENCY

B. SCHLEIN (United Technologies Corp., Pratt and Whitney Div., East Hartford, CT) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 6 p. refs
(ASME PAPER 85-IGT-121)

A method of correlating combustor efficiency as a function of geometry and operating conditions is presented. A simple equation correlates all the data for a given engine type with a single parameter. The correlating parameter is a function of fuel flow, pressure, temperature and volume in a form similar to others in the literature. The unique feature of the correlating parameter is its use of internal gas temperature rather than the commonly used combustor inlet temperature. The result is an equation requiring an iterative solution since combustion efficiency is a part of the correlating parameter. With use of a computer this is easily handled. The correlation fits engine data over all flight conditions from high altitude, high Mach number to sea level idle. The correlation is compared to engine test data for several engines. Author

### LIFE PREDICTION FOR THE MAIN SHAFT OF AIRCRAFT TURBINE ENGINE

D. LIU (Chengdu Engine Co., People's Republic of China) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 8 p. refs
(ASME PAPER 85-IGT-136)

The life prediction of the main shaft is described herein at the following three aspects: estimation of the fatigue life, testing method of the fatigue life and determination method of the service life for the main shaft. Based on the working practice, a block diagram of life determinating procedure for the main shaft, from which the prediction contents and steps of the fatigue life for the main shaft can be seen, is also included. Since the factors affecting the fatigue life of hardwares are very complicated, so only the main factor can be taken into consideration in the method of prediction of the life. Therefore, the emphasis is given to the need for a life prediction computation program which integrates the main shaft design, testing and application, so that the computation theory of the whole life prediction can be established on the foundation of the test practice and service experience. The life of main shaft can be predicted by calculation during the design stage. The local stress method and strain empiric formula are applicable for the prediction of the main shaft life in its elastoplastic area. Author

### DEVELOPMENT OF A NEW TECHNOLOGY SMALL FAN JET ENGINE

D. I. BOYD (Pratt and Whitney Canada, Longueuil) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 8 p.
(ASME PAPER 85-IGT-139)

The JT15D Turbofan Engine was created to power fast economical low noise executive jets for the general aviation market and currently powers the Cessna Citation I and II, Mitsubishi Diamond series and the Aerospatiale Corvette. This paper describes a higher thrust more fuel efficient version, the JT15D-5, with electronic fuel control systems and power up to a thrust level of 3200 lb. The Engine and its development program are described, including flight test and customer installations. Development problems and their solutions are covered. Author

**A86-23938#**

### INVESTIGATION INTO THE CAUSE OF FAILURE OF A TURBOPROP IMPELLER IN SERVICE

H. Y. WONG (Glasgow, University, Scotland) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 7 p.
(ASME PAPER 85-IGT-147)

A 2-stage centrifugal flow turboprop Dart engine failed recently in service due to the failure of the low pressure impeller. Examination by various techniques including electron microscopy based on scanning, energy dispersive analysis of X-ray and transmission electron fractography indicates that the cause was metallurgical in nature, resulting from a material manufacturing defect followed by fatigue fracture and finally by tensile rupture of the material. Author

### PROPELLER DESIGN POINT CALCULATION METHOD FOR COMPARING TURBOFAN/PROPFAN ENGINE PERFORMANCE

M. F. SCHMIDT (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 11 p.
(ASME PAPER 85-IGT-150)

This paper presents a method for calculating the design-point performance of both single rotation and dual contrarotation propellers. Major propeller variables such as power loading, propeller efficiency, propeller tip speed, and propeller adiabatic compression efficiency, are accounted for and correlated. The resulting propeller performance is then combined with engine performance to yield propfan engine performance. The performance trades between power loading, propeller efficiency, propeller tip speed and propeller adiabatic compression efficiency are presented. Resulting performance for a given engine is presented for both single and dual contrarotation propellers. These engine performances can then be compared to advanced turbofan engines that utilize identical technology shaft power-producer engines. Author

### THE FORCED RESPONSE OF SHROUDED FAN STAGES

C.-H. MENQ, J. H. GRIFFIN, and J. BIELAK (Carnegie-Mellon University, Pittsburgh, PA) ASME, Design Engineering Technical Conference, Cincinnati, OH, Sept. 10-13, 1985. 6 p. refs
(Contract AF-AFOSR-0134; F33615-83-K-2316)
(ASME PAPER 85-DET-19)

This paper presents a general approach for modeling shrouded blade vibration that takes into consideration the nonlinear friction constraint at the shroud interface. In this approach, linear structures are characterized by receptances and shroud constraints by nonlinear impedances. The proposed methodology is presented in detail for simplified models of the bladed disk and shroud interface. The corresponding governing equations for the dynamic response are derived for both tuned and mistuned stages. As an example the method is applied to an idealized tuned stage. Two cases are considered, a lubricated shroud for which the coefficient of friction is equal to zero, and a frictionally constrained shroud. The effect of varying the shroud-to-shroud preload is studied. In the lubricated case nonlinear behavior is seen when vibrations are strong enough to result in separation of the shroud interfaces. In the case of finite friction there is a profound change in resonant frequencies when the preload is increased sufficiently to prevent gross slip at the shrouds. Author

### EXCITATION OF BLADE VIBRATION BY FLOW INDUCED ACOUSTIC RESONANCES IN AXIAL-FLOW COMPRESSORS

R. PARKER, S. A. T. STONEMAN, and M. I. CARR IN: Unsteady aerodynamics of turbomachines and propellers; Proceedings of the Symposium, Cambridge, England, September 24-27, 1984 . Cambridge, Cambridge University, 1984, p. 579-600. Research supported by Rolls-Royce, Ltd. and SERC. refs

When operating below design speed, with resulting blade mismatching, there arises a hitherto unrecognized blade vibration phenomenon in research compressors used in aircraft engine research which is clearly associated with acoustic resonances in the compressor annulus. Attention is presently given to the results of theoretical and experimental investigations concerning the effects of compressor annulus shape, as well as those of fluidmechanical/acoustical interactions furnishing the excitatory mechanism. This mechanism is influenced by the acoustic characteristics of the annulus and by the frequency of vortex shedding, which locks onto one of the possible resonances. O.C.

**THE PROP-FAN INTRODUCES A NEW ENGINE GENERATION [DER PROPFAN LEITET EINE NEUE TRIEBWERKSGENERATION EIN]**

P. SCHIMMING (DFVLR, Institut fuer Antriebstechnik, Cologne, West Germany) DFVLR-Nachrichten (ISSN 0011-4901), Nov. 1985, p. 49-51. In German.

The increased importance of fuel costs with respect to the general operating costs of the airlines has led to the design of lighter and aerodynamically more favorable aircraft, and to the development of aircraft engines which consume less fuel. The development of the prop-fan in the U.S. during the early and mid-1970s led to the establishment of new engine concepts. The prop-fan itself is a propeller which has eight or more (as many as 12) blades. New design methods for these advanced propellers make it possible to obtain higher flight speeds at better propeller efficiencies than those provided by conventional propeller propulsion systems (turboprops). For this reason, prop-fan engines are becoming serious rivals of turbofan engines. Attention is given to propulsion system concepts for providing thrust, questions related to the selection of an engine for civil aviation, efficiency obtained on the basis of a design of propeller blades according to the newest aerodynamic viewpoints, and calculations for an engine design with minimum fuel consumption. G.R.

**RESEARCH AND DEVELOPMENT OF FJR 710 TURBO FAN ENGINE - SECOND PHASE**

M. MATSUKI Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 372, 1985, p. 12-19. In Japanese.

The construction, specification, and testing of the FJR 710 turbofan engine are described. The engine developed by the Research Association of Jet Engine Technology, Japan, will be tested with a STOL test aircraft. The basic engine parameters are fan pressure ratio of 1.45, overall pressure ratio of 19, turbine inlet temperature of 1250 C, and bypass ratio of 6.5 for reducing the fuel consumption. The schedule of the engine development including design, manufacturing, tests on performance and operation, and structural tests, such as static loading, blade containment, and overspeed and low cycle fatigue are illustrated. S.H.

**EXPERIMENTAL STUDY OF THE EFFECTS ON THE TURBOFAN ENGINE BY THE DISTORTION**

T. ABE Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 374, 1985, p. 173-181. In Japanese, with abstract in English.

An experimental study was conducted to determine the effects of pressure distortion on the operation of a turbofan engine. In particular, the effects on the pressure ratio and efficiency of a two-stage axial flow fan and a five-stage axial flow compressor were studied. Two distortion indices on the orthogonal coordinate are indicated, and the circumferential distortion index is related to the radial distortion index. It is suggested that three kinds of distortion seem enough to cover all the distortion patterns encountered in flight. The pressure ratio and efficiency of a fan with distorted inflow decreased compared with those for clean inlet flow. However, the operation line and compressor efficiency hardly suffered from the distortion. C.D.

**AN ANALYTICAL METHOD OF THE CHARACTERISTICS OF THE TURBOFAN ENGINE COMPONENTS**

T. ABE Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 376, 1985, p. 303-311. In Japanese, with abstract in English. refs

This paper presents an analytical method to estimate accurately the compressor air mass flow rates an high pressure turbine inlet temperature of a two-spool turbofan engine on the basis of the characteristics of a high-pressure turbine and a combustor. The off-design performance was used as the characteristic of a high-pressure turbine. The pressure loss rates and the combustion efficiency were selected as the characteristics of a combustor. The off-design performance was analyzed from the total pressure loss coefficient analysis of the stator and the blade, and design data. The proposed method was applied to a low bypass ratio two-spool turbofan engine and compared with the model compressor test data. The results proved to be useful for estimating turbofan-engine component performance. Author

**VIBRATION PROBLEMS OF JET ENGINE ROTOR SYSTEMS**

T. MIYACHI Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 379, 1985, p. 439-446. In Japanese. refs

The characteristics of turbo and jet engine rotor systems and problems in their vibrations, and their countermeasures are described. Various possibilities of the vibration of the turbo engine rotor system are analyzed. The control methods of the vibration of the jet engine rotor system characterized include trim balance of the rotor during manufacturing, spectrometric oil analysis program and condition maintenance for monitoring the vibration of the rotor in flight, active clearance control using a full-authority digital engine control method, and a balancing method of the impulse of the rotor. S.H.

**A STUDY OF RAMJET ENGINE. III - AIR INLET PERFORMANCE AS THE ENGINE COMPONENT**

K. FUNAKI Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 381, 1985, p. 584-591. In Japanese, with abstract in English. refs

A computer program was developed for computing the performance of a fixed-geometry two-dimensional external compression supersonic ramjet-engine inlet, which permits the required air mass flow rate for the engine to operate at off-design conditions. The program can compute the quantity of possible air flow coming through the inlet under critical operating conditions as well as the required air flow for the ramjet engine to generate the combustion gas that will be exhausted through a jet nozzle of the engine operating under given engine conditions and critical air inlet operation. A correlation between the exponential function of the flight and design Mach numbers, and the gas properties was found, which makes it possible to predict the pressure recovery in a supercritical regime. The correlation was found to be in good agreement with the available experimental data on ramjet engines. Author

**FLAT RATING CONCEPT INTRODUCED IN THE GTX ENGINE**

A. PRASAD and V. SUNDARARAJAN (Gas Turbine Research Establishment, Bangalore, India) Defence Science Journal (ISSN 0011-748X), vol. 35, April 1985, p. 163-170.

In bypass engines, the loss of thrust increases with increase in the inlet total temperature. The concept of variable cycle, achieved by varying the maximum cycle temperature in order to increase the available dry thrust, is explained, together with its application to the GTX 37-14U engine design. The design principles of the GTX engine, which is a twin spool turbojet with a throttle ratio of 1.13 are briefly described and the engine performance at 288 K and 318 K is compared to that of a conventional design with a throttle ratio of unity. The variable cycle concept is presently recognized in the design of engines for combat aircraft, designed for supersonic cruise at altitude. Graphs of the performance analysis are included. I.S.

**THE RELATIONSHIP OF ULTRAFINE FILTRATION AND OIL DEBRIS MONITORING FOR HELICOPTER PROPULSION SYSTEMS**
T. TAUBER (Technical Development Co., Glenolden, PA) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 13 p. refs

Research data indicate that rolling-element bearing life can be extended considerably by improving lubricant filtration. It is pointed out that disposable ultrafine oil filters with ratings better than 7 micrometers absolute have been commercially available for some time and are being used in several helicopter engines. In the past, helicopter drive systems have been equipped with relatively coarse filters. The U.S. Army has conducted an extensive evaluation of ultrafine filters and advanced oil debris monitoring technology between 1978 and 1983. The test fleet was retrofitted with an advanced Oil Debris Detection System (ODDS). The U.S. Army ODDS program is discussed, taking into account splash-type vs. full-flow chip detection, component wear, and debris. The program demonstrated that failure progression of any component occurs over a considerably longer period of time than any one particular flight. G.R.

**T700 - A PROGRAM DESIGNED FOR EARLY MATURITY AND GROWTH POTENTIAL**
E. E. MARTIN (General Electric Co., Turboshaft Engine Projects Dept., Lynn, MA) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 18 p. refs

Work related to the development of an advanced turboshaft engine to be used in a utility type of helicopter was started by an American aerospace company in the 1960s. This engine, which later became the T700, was to provide a replacement for the T58, a successful but aging helicopter powerplant which originated in the 1950s. The U.S. Army needed a turboshaft engine with greatly improved capability relative to previous generation machines for its helicopters, and the T700 was developed to meet these requirements. Currently three turboshaft engine models have been qualified to power six military aircraft versions, while three turboshaft and two turboprop versions have been certificated for application on six civil aircraft. **PERFORMANCE COMPUTATION OF TURBOFAN AND TURBOJET ENGINES IN OFF-DESIGN CONDITIONS**
G. BRIDEL 11 Oct. 1984 28 p refs In GERMAN; ENGLISH summary
(F+W-FO-1746) Avail: NTIS HC A03/MF A01

A prediction method of underload performance of turbojet and turbofan engines based on gas dynamic relations was developed using mass flow rate, compression ratio, turbine inlet temperature, thrust, and fuel consumption. More precise prediction results can be obtained by incorporating compressor efficiency. A BASIC computer program is described and results are compared with existing data. Up to a throttling coefficient of 50% of the maximum thrust, the deviation with respect to the measured values falls within + or - 20%. The specific fuel consumption is improved in underload medium range but is increased at high throttling coefficients. Accuracy improvement is achieved with introduction of variable compressor and turbine efficiency. Author (ESA)

**LONGITUDINAL FLYING QUALITITES CRITERIA FOR SINGLE-PILOT INSTRUMENT FLIGHT OPERATIONS**
A. BAR-GILL (Rafael Armament Development Authority, Haifa, Israel) and R. F. STENGEL (Princeton University, NJ) Journal of Aircraft (ISSN 0021-8669), vol. 23, Feb. 1986, p. 111-117. Previously announced in STAR as N83-30407. refs
(Contract NAS1-15864; NGL-31-001-252)

Modern estimation and control theory, flight testing, and statistical analysis were used to deduce flying qualities criteria for General Aviation Single Pilot Instrument Flight Rule (SPIFR) operations. The principal concern is that unsatisfactory aircraft dynamic response combined with high navigation/communication workload can produce problems of safety and efficiency. To alleviate these problems, the relative importance of these factors must be determined. This objective was achieved by flying SPIFR tasks with different aircraft dynamic configurations and assessing the effects of such variations under these conditions. The experimental results yielded quantitative indicators of pilot's performance and workload, and for each of them, multivariate regression was applied to evaluate several candidate flying qualities criteria. S.L.

**A STABLE DISCRETE-TIME ADAPTIVE OBSERVER APPLIED TO MULTIVARIABLE AIRCRAFT**
P. N. NIKIFORUK, N. HORI (Saskatchewan, University, Saskatoon, Canada), and K. KANAI (Defense Academy, Yokosuka, Japan) IN: Dynamic systems: Modelling and control; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 . New York, American Society of Mechanical Engineers, 1985, p. 189-194. refs

The parameters and state variables of an unknown aircraft are estimated using an adaptive observer which is applicable to multivariable systems expressed in block observer form. The observer used is a simple extension of the single-variable situation to the multivariable case and requires neither the decomposition nor cyclicity of the system. This may make the design of a flight control system which needs the parameters and state vector of the aircraft as simple as one for single-variable systems. The results of simulation studies are given for the T-2 CCV with particular reference to the longitudinal aircraft motions. Author

**THE STUDY OF ADAPTIVE CONTROL AUGMENTATION SYSTEM IMPLEMENTED WITH MICROCOMPUTER**

W. WANG and S. XIAO Northwestern Polytechnical University, Journal, vol. 4, Jan. 1986, p. 23-33. In Chinese, with abstract in English. refs

The Hartmann and Drebs (1980) longitudinal adaptive control augmentation system neglected the influence of actuator dynamics, whihc is presently considered as a first-order inertial block. A simple but useful Kalman filter-based model for parameter estimation is also proposed through which computational requirements are decreased to 50 percent of the original. Attention is given to the microcomputer implementation of the scheme proposed; in order to satisfy real time criteria, the software employs module-structure fixed point operation and machine language. O.C.

**PROPOSAL FOR THE CHOICE OF STATE VARIABLES FOR EQUATIONS OF MOTION OF AIRCRAFT IN MOVING AIR [EIN VORSCHLAG FUER DIE WAHL DER ZUSTANDSVARIABLEN IN DEN BEWEGUNGSGLEICHUNGEN VON FLUGZEUGEN UNTER WINDEINFLUSS]**

R. BROCKHAUS (Braunschweig, Technische Universitaet, Brunswick, West Germany) Zeitschrift fuer Flugwissenschaften und Weltraumforschung (ISSN 0342-068X), vol. 9, Nov.-Dec. 1985, p. 376-382. In German. refs

An attempt is made, by the exact definition of state variables for longitudinal and lateral motion, to achieve a more complete coupling between aircraft motion and wind. In addition to using the previously introduced wind angles alpha(W) and beta(W), two additional angles alpha(K) and beta(K) are introduced as 'inertial' components of the angles of incidence and sideslip. These new angles are defined using a series of Eulerian angles between flight path and body-fixed coordinates. The use of these variables in the equations of motion demonstrate the advantages of selecting them as state variables. The effect of wind motion on the aircraft is clarified thereby. C.D.

**THE EFFECTIVENESS OF VARIOUS CONTROL SURFACES IN QUASI-STEADY AND UNSTEADY FLOWS - APPLICATIONS [EFFICACITE DE DIFFERENTES SURFACES DE CONTROLE EN QUASI-STATIONNAIRE ET INSTATIONNAIRE - APPLICATIONS]**

R. DESTUYNDER (ONERA, Chatillon-sous-Bagneux, France), R. BARREAU (Aerospatiale, Toulouse, France), and G. ANDERS (Messerschmitt-Boelkow-Blohm GmbH, Bremen, West Germany) (NATO, AGARD, Meeting, 61st, Oberammergau, West Germany, Sept. 8-13, 1985) ONERA, TP, no. 1985-147, 1985, 69 p. In French. refs

(ONERA, TP NO. 1985-147)

Two large-scale half-models fitted with unsteady pressure sensors and static pressure taps were employed to study the effectiveness of various active control surfaces such as those being installed on modern transport aircraft. The studies covered the performances of spoilers with and without slots, flaperons, ailerons and trailing edge flaps and combinations of each from Mach 0.5 up to transonic speeds. A database was developed for defining semi-empirical corrections to models for the lifting and moment values for the control surfaces. Vibrations were induced using hydraulic actuators which induced rotations of up to 400 deg/sec, thereby imparting white noise over the 0-30 Hz range, harmonics, and pitching from 135-270 deg/sec. Angles of attack from -2 to +7 deg were examined, along with severe wing deflection. The excitations and data collection were entirely computer-controlled. Spoilers, which exhibited sufficient promise to encourage their continued development, were particularly effective when more than one were used. Additivity was also observed when flaperons were installed, provided an adaptive control law was defined for their use. M.S.K.

**HELICOPTER ACTIVE CONTROL WITH BLADE STALL ALLEVIATION MODAL CAPABILITY**
A. DANESI (Roma, Universita, Rome, Italy) and A. DANESI (Selenia-Industrie Elettroniche Associate, S.p.A., Pomezia, Italy) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 19 p. refs

An active modal control for high-performance helicopters in forward flight is presented. A blade stall alleviation control strategy based on the spectral data computed from the flexible blade structural mode of vibration measurements is employed to suppress the blade torsional motion associated with the stall flutter and to reduce the possibility of high angle of attack onset on the retreating blade. The restoring collective pitch commands are derived for processing the output data from an electrooptical laser sensor by means of a microprocessor performing the power spectral density real time computations; these data, obtained implementing an FFT algorithm and observed within a frequency window centered at the dominant torsional mode frequency, are employed as a measure of the actual vibrational level existing on the blade. An optimal control strategy is implemented in order to release the blade loads below the critical limits predicted for the blade stall onset. Author

**DFVLR FLYING QUALITIES RESEARCH USING OPERATIONAL HELICOPTERS**
H.-J. PAUSDER and K. SANDERS (DFVLR, Institut fuer Flugmechanik, Brunswick, West Germany) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 16 p. refs

A flight test program has been conducted in the field of flying qualities research. The tests utilized the operational helicopters BO 105 and UH-1D of the DFVLR and the German Flight Test Center. The main advantage of operational helicopters is the reality of visual and motion cues for the pilot. The extensive flight tests had the objectives: (1) to assess the demands of missions, (2) to derive qualified flight test tasks, (3) to determine criteria for task performance evaluation, and (4) to establish anchorpoints for an examination of validity of a simulator results. An overview of the DFVLR test activities is presented. Exemplary results for each objective are shown. A definition of agility demands for missions and a task performance evaluation approach for 'dolphin' and 'slalom' are discussed. Author

**HELICOPTER MANEUVRE STABILITY - A NEW TWIST**
M. R. SWALES and A. W. DEBUSE (Empire Test Pilots' School, Boscombe Down, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 18 p. refs

Modern helicopters, with their wide maneuver and speed envelopes, need to have their maneuver stability carefully assessed using up to date techniques which set realistic limits, easily respected by operational pilots. The phenomenon of maneuver stability is explained in theory and practice with a brief discussion on the classical flight test methods used in the past to establish acceptability criteria for a helicopter's maneuver stability. This approach is then extended to encompass modern helicopters capable of high sustained turn rates, negative g, having sophisticated automatic flight control systems, hingeless rotors, and the tandem rotor configuration. Modern maneuver stability flight test techniques which are taught to student helicopter test pilots are described with recommendations from typical flight test results including maneuver limitations and methods of communicating them to the helicopter pilot. **HELICOPTER ATTITUDE STABILIZATION USING INDIVIDUAL-BLADE-CONTROL**
N. D. HAM (MIT, Cambridge, MA) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 7 p. NASA-sponsored research. refs

A theoretical study is presented on the application of the Individual-Blade-Control concept to helicopter attitude stabilization. The design of a system controlling blade flapping dynamics, and related testing of the system on a model rotor in the wind tunnel, is described. The control inputs considered are blade pitch changes proportional to blade flapping acceleration, velocity, and displacement. The effect of such a system on helicopter rotor damping-in-pitch, and angle-of-attack stability is then evaluated. It is shown that helicopter attitude stabilization is achieved, with a corresponding improvement in flying qualities. R.R.

**COMPARISON OF PILOT EFFECTIVE TIME DELAY FOR COCKPIT CONTROLLERS USED ON SPACE SHUTTLE AND CONVENTIONAL AIRCRAFT**
C. M. PRIVOZNIK and D. T. BERRY Feb. 1986 20 p refs
(NASA-TM-86030; H-1222; NAS 1.15:86030) Avail: NTIS HC A02/MF A01 CSCL 01C

A study was conducted at the Dryden Flight Research Facility of NASA Ames Research Center (Ames-Dryden) to compare pilot effective time delay for the space shuttle rotational hand controller with that for conventional stick controllers. The space shuttle controller has three degrees of freedom and nonlinear gearing. The conventional stick has two degrees of freedom and linear gearing. Two spring constants were used, allowing the conventional stick to be evaluated in both a light and a heavy configuration. Pilot effective time delay was obtained separately for pitch and roll through first-order, closed-loop, compensatory tracking tasks. The tasks were implemented through the space shuttle cockpit simulator and a critical task tester device. A total of 900 data runs were made using four test pilots and one nonpilot (engineer) for two system delays in pitch and roll modes. Results showed that the heavier conventional control stick had the lowest pilot effective time delays. The light conventional control stick had pilot effective time delays similar to those of the shuttle controller. All configurations showed an increase in pilot effective time delay with an increase in total system delay. Author

**N86-19325*#** National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.
**FLIGHT TEST OF A RESIDENT BACKUP SOFTWARE SYSTEM**
D. A. DEETS, W. P. LOCK, and V. A. MEGNA (Draper (Charles Stark) Lab., Cambridge, Mass.) Jan. 1986 12 p refs Submitted for publication
(NASA-TM-86807; H-1338; NAS 1.15:86807) Avail: NTIS HC A02/MF A01 CSCL 01C

A new fault-tolerant system software concept employing the primary digital computers as host for the backup software portion has been implemented and flight tested in the F-8 digital fly-by-wire airplane. The system was implemented in such a way that essentially no transients occurred in transferring from primary to backup software. This was accomplished without a significant increase in the complexity of the backup software. The primary digital system was frame synchronized, which provided several advantages in implementing the resident backup software system. Since the time of the flight tests, two other flight vehicle programs have made a commitment to incorporate resident backup software similar in nature to the system described in this paper. Author

**DETERMINATION OF PERFORMANCE AND STABILITY CHARACTERISTICS FROM DYNAMIC MANEUVERS WITH A TRANSPORT AIRCRAFT USING PARAMETER IDENTIFICATION TECHNIQUES**

J. H. BREEMAN, L. J. J. ERKELENS, and A. M. H. NIEUWPOORT 14 Mar. 1984 23 p refs Presented at AGARD Flight Mechanics Panel Symposium on Flight Test Technology, Lisbon, Portugal, 2-5 Apr. 1984
(Contract NIVR-1816)
(NLR-MP-84024-U; B8572246) Avail: NTIS HC A02/MF A01

A flight test program was executed with the Fokker F28 transport aircraft to investigate whether it is possible to determine performance and stability characteristics from dynamic maneuvers using parameter identification techniques, with sufficient accuracy for certification purposes. A research moving base flight simulator was used to select an optimal set of maneuvers. Flight test data was analyzed, using the two-step method which starts by reconstructing the aircraft flight path as the first step, followed by calculation of aerodynamic coefficients using regression analysis techniques. The flight test results compared with results derived from conventional test programs show that the goal is reached. Author (ESA)

**SIMULATOR DESIGN FEATURES FOR HELICOPTER LANDING ON SMALL SHIPS**

D. P. WESTRA and G. LINTERN (Essex Corp., Orlando, FL) IN: Human Factors Society, Annual Meeting, 28th, San Antonio, TX, October 22-26, 1984, Proceedings. Volume 2 . Santa Monica, CA, Human Factors Society, 1984, p. 1018-1022. refs

The role of helicopters in the U.S. Navy has considerably increased in recent years, and many Navy vessels support helicopters. The problems which arise in general in connection with aircraft operations at sea are aggravated on small ships because of the confined landing area and the instability of the deck. The present paper is concerned with an experiment which initiates research at the Naval Training Equipment Center's Visual Technology Research Simulator (VTRS) into simulator design and use in teaching essential flight control skills for helicopter operations from small ships. The reported experiment investigates the performance of eight experienced pilots in the simulator. The obtained results will be used to aid in the design of future transfer-of-training experiments to ultimately determine design requirements for simulators used to train the task of landing helicopters on small ships at sea. G.R.

**OPTICAL FIBERS APPLICATION TO VISUALIZATION OF FLOW SEPARATION INSIDE AN AIRCRAFT INTAKE IN WIND TUNNEL**
M. PHILBERT, R. DERON, J.-P. FALENI, J.-B. BION, and H. SALAUE (ONERA, Chatillon-sous-Bagneux, France) (SPIE - The International Society for Optical Engineering and Association Nationale de la Recherche Technique, International Symposium on Optical and Electro-Optical Applied Science and Engineering, 2nd, Cannes, France, Nov. 25-Dec. 6, 1985) ONERA, TP, no. 1985-158, 1985, 8 p. refs
(ONERA, TP NO. 1985-158)

An experiment visualizing air flow separation in an aircraft air-intake is presented. This experiment was realized in a large industrial wind-tunnel. It uses optical fibers to bring a laser beam into the model, and an optical fiber endoscope to visualize images of the phenomenon. Some pictures showing changes of the air flow separation are presented for several aerodynamic conditions. Author

**AERODYNAMIC TESTING CONFERENCE, 14TH, WEST PALM BEACH, FL, MARCH 5-7, 1986, TECHNICAL PAPERS**
Conference sponsored by AIAA. New York, American Institute of Aeronautics and Astronautics, 1986, 419 p. For individual items see A86-24727 to A86-24765.

The present conference on aerodynamic testing apparatuses and methods considers current and planned wind tunnel capabilities at NASA Lewis, the estimation of unsteady forces on a cascade in three-dimensional turbulence, the test methods of the NASA Langley 0.3-m transonic cryogenic wind tunnel, testing experience at the National Transonic Facility, computational fluid dynamics code verification, progress with the NASA Lewis Altitude Wind Tunnel modeling program, the NASA Langley low turbulence pressure and supersonic low disturbance wind tunnels, and the effects of compressibility and freestream turbulence on boundary layer transition in high subsonic and transonic flows. Also discussed are the 'continuous sweep' pressure prediction technique, supersonic wind tunnel optimization, flexible wall nozzle design, hover-in-ground-effect testing for a full scale tilt-nacelle V/STOL model, accuracy in force testing in cryogenic wind tunnels, and experiments with a high performance canard airfoil with boundary layer trip and vortex generators. O.C.

**THE ROLE OF WIND TUNNEL TESTING IN FUTURE AIRCRAFT DEVELOPMENT**
V. F. MEZNARSIC (McDonnell Aircraft Co., St. Louis, MO) IN: Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 127-133.
(AIAA PAPER 86-0750)

An assessment is made of various factors affecting the aerodynamic configuration development and wind tunnel testing of advanced fighter aircraft, with attention to such techniques as the use of low cost models during the conceptual design phase for high angle-of-attack stability and control trend evaluation, as well as the use of large scale, low speed models for refined development work in the high angle-of-attack regime. Design features and functions are noted for a powered model support whose blockage is comparable to that of an unpowered support, and a high speed swept blade support strut that eliminates aft end distortion problems common with sting installations. Flow visualization techniques employing flat sheet laser illumination have also been developed. O.C.

**FUTURE REQUIREMENTS OF WIND TUNNELS FOR AERONAUTICAL SYSTEMS DEVELOPMENT**
M. L. BUCK and T. R. SIERON (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN: Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 134-140. refs
(AIAA PAPER 86-0751)

This paper explores the requirements for future wind tunnels based on an assessment of the performance capabilities and goals of advanced aerospace vehicles. Conventional fighters, bombers, transports and special purpose vehicles are considered. In addition, operational environments are postulated for hypervelocity vehicles. Typical flight corridors are shown with the associated flow density, such as, real gas effects, low density flow, and nonequilibrium flow. An evaluation of the flight regimes and consideration of the operational requirements provides the insight for identifying future wind tunnel requirements. The area where the most serious testing deficiencies exist is at hypersonic speeds. Several types of hypersonic facilities are outlined which could provide critical wind tunnel data for the development of future hypervelocity vehicles. An observation is made that Computational Fluid Dynamics will require wind tunnel data to define detailed flow phenomena and to provide validation and guidance on flow modeling. Author

**FUTURE REQUIREMENTS OF WIND TUNNELS FOR CFD CODE VERIFICATION**
C. W. BOPPE (Grumman Aerospace Corp., Aircraft Systems Div., Bethpage, NY) IN: Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 160-172. refs
(AIAA PAPER 86-0753)

Merit of Computational Fluid Dynamics (CFD) in the aircraft development process is measured by the degree to which flight characteristics can be simulated for advancing performance and/or improving flight safety. Unfortunately, elements of flight instrumentation and testing compromise the data required for computational flow simulation code development and verification efforts. Wind tunnel data satisfy this requirement to a large extent, but care must be taken to properly account for idiosyncrasies associated with subscale testing. Clearly, any facility feature which improves ability to simulate flight characteristics will favorably impact data taken for CFD code verification. In addition, however, a need for higher density in data resolution is identified. Technology exists to resolve current constraints, but it is not clear that means can be implemented in a cost-effective manner or that multiple problems can be resolved simultaneously. Several case studies are described which highlight future test requirements for code validation. The appendix describes several CFD/wind tunnel/flight test comparisons. Author

**DYNAMIC SUPPORT INTERFERENCE IN HIGH ALPHA TESTING**
L. E. ERICSSON and J. P. REDING (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA) IN: Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 203-214. refs
(AIAA PAPER 86-0760)

Dynamic test results of aircraft models at high angles of attack are analyzed in regard to support interference effects. Single degree of freedom oscillatory tests in pitch or yaw are subject to the same type of support interference through the near wake recirculatory region as is experienced by slender bodies of revolution. Consequently, the measurements can be corrected for support interference using the same methodology. The support interference associated with rotary rigs used in coning experiments is of a different type, being stationary in nature rather than unsteady, with the coning motion inducing a displacement of the vortex wake similar to that caused by sideslip in a static test. Performing static tests at varying incidence and sideslip angles with two alternate supports can provide the information needed to correct coning experiments for support interference. Author

**SOME LESSONS LEARNED WITH WIND TUNNELS**

M. L. SPEARMAN (NASA, Langley Research Center, Hampton, VA) IN: Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 316-326. refs
(AIAA PAPER 86-0777)

An historical evaluation is made of the most significant developments in the use of wind tunnels for the development and analysis of missiles and aircraft since the 1940s. In addition to being instrumental in the discovery of unknown aerodynamic, aeroelastic and aerothermodynamic phenomena, wind tunnels have helped in the explanation of numerous effects, the development of new configurations and systems, and the furnishing of critical initial performance evaluations for a broad spectrum of aircraft and missiles. Attention is given to low speed planform tests, body-wing-tail studies, variable sweep wing investigations, transonic characteristics and problems, supersonic trim drag, and supersonic pitch-up, area ruling, and inlet effects. O.C.

**THE ACCURACY PROBLEM OF AIRPLANE DEVELOPMENT FORCE TESTING IN CRYOGENIC WIND TUNNELS**

B. EWALD (Darmstadt, Technische Hochschule, West Germany) and G. KRENZ (Messerschmitt-Boelkow-Blohm GmbH, Bremen, West Germany) IN: Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 405-415.
(AIAA PAPER 86-0776)

The measurement accuracy attainable in wind tunnel testing is limited by tunnel flow quality, model quality, and balance accuracy. It is presently noted that considerable accuracy improvements are obtainable through the use of large wind tunnel models and careful adaptation of the balance ranges to the test requirements. The primary uncertainty in balance measurements is due to thermal effects in the balance that are considerably exacerbated by cryogenic wind tunnel conditions. Attention is presently given to cryogenic balance development efforts which are aimed at the avoidance of temperature gradients in the balance structure. O.C.

**THE DEVELOPMENT OF AN ADVANCED HELICOPTER RESEARCH SIMULATOR**

F. J. MALKIN (U.S. Army, Human Engineering Laboratory, Aberdeen Proving Ground, MD) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 213-216.
(SAE PAPER 841610)

The development of a research simulator for an advanced helicopter cockpit is described. The purpose of the simulator is to evaluate the impact on human performance of multifunctional controls and displays, to be implemented in a family of light military helicopters. The objectives of the research is to tailor the crew station by reducing control and display interaction required of the operators, and by maximizing information transfer. The control input devices to be evaluated include key pads, touch-sensitive screens, joy sticks, and voice-actuated controls. In addition, various display formats, the optimum number of displays required, their arrangement and location, the helmet-mounted and panel-mounted displays, speech input/output applications, manual versus automated control tradeoffs, and side-arm control considerations will be investigated. The configuration of the simulator, the crew station, and the experimenter's console are described. I.S.

**DFVLR HELICOPTER IN-FLIGHT SIMULATOR FOR FLYING QUALITY RESEARCH**

B. GMELIN, G. BOUWER, and D. HUMMES (DFVLR, Institut fuer Flugmechanik, Brunswick, West Germany) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 20 p. refs

New missions for civil and military helicopters lead to increasing higher demands in the field of flying qualities. The necessary research activities require extensive ground-based simulations and flight tests in particular. For flight testing, operational helicopters and research helicopters with variable dynamic characteristics are used for specific tasks. In order to fulfill the research needs for future helicopter systems, in-flight simulators will play an important role in flying quality research. The intention of this paper is to discuss the need for and the tasks of an in-flight simulator for flying quality research with emphasis on DFVLR activities. The DFVLR in-flight simulator BO 105 ATTHeS is described including the model following control system design and realization. First results of a ground-based simulation program and flight tests are presented showing the efficiency of the concept and demonstrating the potential for future flying quality research. Author

**AIRCREW-AIRCRAFT INTEGRATION - A SUMMARY OF U.S. ARMY RESEARCH PROGRAMS AND PLANS**

D. L. KEY and E. W. AIKEN (NASA, Ames Research Center; U.S. Army, Aeromechanics Laboratory, Moffett Field, CA) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 22 p. Previously announced in STAR as N85-11004. refs

A review of selected programs which illustrate the research efforts of the U.S. Army Aeromechanics Laboratory in the area of aircrew-aircraft integration is presented. Plans for research programs to support the development of future military rotorcraft are also described. The crew of a combat helicopter must, in general, perform two major functions during the conduct of a particular mission: flightpath control and mission management. Accordingly, the research programs described are being conducted in the same two major categories: (1) flightpath control, which encompasses the areas of handling qualities, stability and control, and displays for the pilot's control of the rotorcraft's flightpath, and (2) mission management, which includes human factors and cockpit integration research topics related to performance of navigation, communication, and aircraft systems management tasks. **WIDE-ANGLE, LOW-ALTITUDE FLIGHT SIMULATOR VISION SYSTEM FOR COCKPIT RESEARCH AND AIRCREW TRAINING**

A. CORT and R. HAWTIN (Westland Helicopters, Ltd., Yeovil, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 13 p.

A low cost helicopter flight simulator capable of reproducing night vision goggle flight over a height range of 0 to 300 ft and with a lateral field-of-view of 270 degrees has been developed by the Westland vision system (Vistasim). A terrain image stored in a photographic transparency that is projected onto a spherical screen surrounding the simulator cockpit by the point source projection technique is used and a sharp, bright image is achieved using a low power monochromatic laser. A servomechanism producing 6 degrees of freedom of movement of the transparency with respect to the projection screen generates the illusion of movement. A computerized mathematical flight model of the aircraft provides the necessary interface between the pilot's controls and the servomechanism. Despite tradeoffs made between allowable rotation angles, transparency size, dome size, light power and image distortion, the system exceeds all but the most advanced CGIs in scene content and realism. **CURRENT WIND TUNNEL CAPABILITY AND PLANNED IMPROVEMENTS AT LEWIS RESEARCH CENTER**

D. N. BOWDITCH 1986 24 p refs Prepared for presentation at the 14th Aerodynamic Testing Conference, West Palm Beach, Fla., 5-7 Mar. 1986; sponsored by AIAA

(NASA-TM-87190; E-2844; NAS 1.15:87190) Avail: NTIS HC A02/MF A01 CSCL 14B

As the propulsion and power generation center of NASA, Lewis has designed its wind tunnels for propulsion research. Therefore, the 8 by 6 Foot Supersonic Wind Tunnel and the 10 by 10 Foot Supersonic Wind Tunnel provide the capability to test operating propulsion systems from Mach 0.4 to 3.5. The 9 by 15 Foot Wind Tunnel can investigate propulsion installation problems at the lower takeoff and landing speeds and provides an excellent anechoic environment to measure propeller and fan noise. The Lewis Central Air System provides steady air supplies to 450 psi, and exhaust to 3 in. of mercury absolute, which are available to the wind tunnels for simulation of jets and engine induced flows. The Lewis Icing Research Tunnel is the largest in the free world that can produce icing conditions throughout the year. Rehabilitation of the Altitude Wind Tunnel at Lewis would allow testing of propulsion systems in the upper left hand corner which would be a unique capability. Also, in a mothballed state at Lewis, the Hypersonic Tunnel Facility could provide the best simulation of nonvitiated Mach 5-7 test conditions available. Studies are currently being made of the Lewis facilities to identify enhancements of their research potential for the 1990's and beyond. Author

**FLIGHT TRAINING SIMULATORS. EFFECTS OF TERRAIN ACCURACY ON SIMULATED RADAR IMAGE QUALITY Interim Technical Paper, Sep. 1984 - May 1985**

P. M. CRANE Sep. 1985 18 p

(Contract AF PROJ. 614)

(AD-A160905; AFHRL-TP-85-28) Avail: NTIS HC A02/MF A01 CSCL 17I

This experiment evaluated the effect of terrain vertical accuracy on the quality and perceived training effectiveness of simulated radar images. Seven Air Force navigators judged the quality and training value of digital radar landmass imagery produced at six different levels of terrain vertical accuracy. Each image represented the simulated ground mapping radar image of a mountainous area viewed from an altitude of 10,000 feet. The results indicated that: (1) increasing terrain vertical accuracy above the current production standard did not significantly increase either the judged quality of the imagery or its perceived training value; and (2) decreasing terrain vertical accuracy below the current production standard significantly increased either the judged quality of the imagery or the perceived training value of the imagery. Although the results of this experiment do not provide any justification for more stringent accuracy requirements, it is recommended that this experiment be replicated using lower altitude imagery in which the effects of terrain evaluation are more pronounced. **DEVELOPMENT OF AUTONOMOUS POWER SYSTEM TESTBED**

J. R. BARTON, M. E. LIFFRING (Boeing Aerospace Co., Seattle, WA), and T. ADAMS (Advanced Information and Decision Systems, Mountain View, CA) IN: Intersociety Energy Conversion Engineering Conference, 20th, Miami Beach, FL, August 18-23, 1985, Proceedings. Volume 1 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 1.466-1.471.

A power system testbed has been assembled to advance the development of large autonomous electrical power systems required for the space station, spacecraft, and aircraft. The power system for this effort was designed to simulate singleor dual-bus autonomous power systems, or autonomous systems that reconfigure from a single bus to a dual bus following a severe fault. The approach taken was to provide a flexible power system design with two computer systems for control and management. One computer operates as the control system and performs basic control functions, data and command processing, charge control, and provides status to the second computer. The second computer contains expert system software for mission planning, load management, fault identification and recovery, and sends load and configuration commands to the control system. Author

**DETERMINATION OF THE SERVICE LIFE OF AVIATION OILS [OPREDELENIE SROKOV SLUZHBY AVIATSIONNYKH MASEL]**
V. G. KUZNETSOV, G. T. NOVOSARTOV, A. I. ECHIN, and V. N. BAKUNIN Khimiia i Tekhnologiia Topliv i Masel (ISSN 0023-1169), no. 11, 1985, p. 39, 40. In Russian.

A procedure for determining the actual service life of the oils used in gas-turbine aircraft engines is proposed which is based on an experimental evaluation of the thermal oxidation stability of the oils using laboratory testing equipment. In particular, the method involves a study of the dynamics of changes in the contents of the principal additives and in the indices characterizing the service properties of the oil. Measurements of the additive contents and quality indices are made at certain intervals of time during the oxidation of oil in the laboratory. Each of the values is plotted against the time of oxidation, and the contents of additives an abrupt degradation of the oil properties are determined. This minimum additive content is then used as an oil performance criterion which determines the maximum allowable service life. Test results are presented for B-3V and IMP-10 aviation oils. V.L.

**FIBER-REINFORCED PLASTIC COMPOSITES FOR ENERGY ABSORPTION PURPOSES**
P. H. THORNTON, J. J. HARWOOD, and P. BEARDMORE (Ford Motor Co., Dearborn, MI) (International Symposium on Composites: Materials and Engineering, University of Delaware, Newark, Sept. 24-28, 1984) Composites Science and Technology (ISSN 0266-3538), vol. 24, no. 4, 1985, p. 275-298. refs

The energy-absorbing characteristics in axial collapse of structures made from fiber-reinforced plastic (FRP) composites are reviewed from both the materials and the structural viewpoints. The type and nature of the fiber and resin, the geometry of the structure and the fiber arrangement affect significantly the energy-absorbing capability, but the data currently available are not yet sufficient to give a clearly unambiguous answer for a particular situation. An effective trigger mechanism is necessary to initiate stable collapse since thin-wall structures in particular are prone to unstable collapse. Methods are described to estimate the energy-absorbing potential of an FRP composite tructure. Author

**THE PRODUCTION OF JET FUEL FROM ALTERNATE SOURCES**
H. R. LANDER, JR. (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH) and H. E. REIF (Sun Refining and Marketing Co., Marcus Hook, PA) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 8 p. refs
(ASME PAPER 85-IGT-67)

The most significant potential source of aviation gas turbine fuels in the continental United States of America is the western oil shale located in the Rocky Mountain States of Colorado, Utah, and Wyoming. Nearly 600 billion barrels of recoverable oil is located in this area. This paper discusses the availability of oil shale and reviews the recovery, upgrading and refining schemes necessary to produce fuel which can be used in present-day aircraft. Other synthetic fuels are discussed with regard to the processing necessary to produce suitable fuels for today's high performance aircraft. Heavy oil and tar sand bitumen are likely to be refined in the next decade. Methods for producing suitable fuels are discussed. The chemical structure of these sources, whigh is basically cyclic, leads to the potential of heavier fuels with more energy per given volume and therefore longer range for certain aircraft. This exciting possibility is reviewed. Author

### INTERLAMINAR FRACTURE OF COMPOSITES

T. K. OBRIEN (NASA, Langley Research Center; U.S. Army, Structures Laboratory, Hampton, VA) Aeronautical Society of India, Journal (ISSN 0001-9267), vol. 37, Feb. 1985, p. 61-69. Previously announced in STAR as N84-27835. refs

Fracture mechanics has been found to be a useful tool for understanding composite delamination. Analyses for calculating strain energy release rates associated with delamination growth have been developed. These analyses successfully characterized delamination onset and growth for particular sources of delamination. Low velocity impact has been found to be the most severe source of composite delamination. A variety of test methods for measuring interlaminar fracture toughness are being developed to identify new composite materials with enhanced delamination resistance. Author

### ARALL - A LIGHT WEIGHT STRUCTURAL MATERIAL FOR IMPACT AND FATIGUE SENSITIVE STRUCTURES

J. W. GUNNINK, M. L. C. E. VERBRUGGEN, and L. B. VOGELESANG (Delft, Technische Hogeschool, Netherlands) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 16 p. refs

A new hybrid material is obtained by incorporating 'high modulus' fibers into the bondline of laminated sheet material. This material is called ARALL (Aramid Reinforced Aluminium Laminate). Principally ARALL was developed to obtain a material with very good fatigue properties, in which possible cracks would grow very slowly. However, it turns out that ARALL is also a strong material with relatively low density. Preliminary tests have shown that the material also has promising impact and energy absorbing properties, which may qualify it as an interesting material for those applications where a high degree of ballistic tolerance is required. Aircraft design studies have indicated that, especially for fatigue sensitive areas such as the lower wing and the skin of a pressure cabin, ARALL is an attractive material. Weight savings of more than 30 percent should be attainable in practice. This paper gives a survey of the ARALL production process, and the properties of the material including mechanical properties, durability and some workshop aspects. Properties of joints and some applications of the material are also discussed. Author

### CORROSION PROTECTION OF HELICOPTERS THROUGH ORGANIC COATINGS

H. S. M. BALVERS (Sikkens Aerospace Finishes, Sassenheim, Netherlands) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 9 p.

For decades, aluminum-based alloys have been the most important construction material in the helicopter industry and in the aircraft industry in general. The reason for this situation is related to the favorable 'mechanical strength-weight' ratio provided by aluminum materials. However, a disadvantage of suitable aluminum alloys is a limited resistance against corrosion. The present paper provides a description of various materials which can be used as protective coatings for aluminum alloys, taking into account inorganic and organic coatings. After an evaluation of the various approaches avaiable to protect an aluminum alloy with the aid of a coating, it is concluded that organic coatings are indispensable to obtain the best possible protection for aircraft in general and helicopters in particular. ### FIRE-RETARDANT DECORATIVE INKS FOR AIRCRAFT INTERIORS

D. A. KOURTIDES, Z. NIR (Makhteshim, Ltd., Beersheeba, Israel), and J. A. MIKROYANNIDIS (Patras Univ., Greece) Dec. 1985 14 p refs
(NASA-TM-88198; A-85414; NAS 1.15:88198) Avail: NTIS HC A02/MF A01 CSCL 07C

Commercial and experimental fire retardants were screened as potential fire retardants for acrylic printing inks used on aircraft interior sandwich panels. The fire retardants are selected according to their physical properties and their thermostabilities. A criterion for selecting a more stable fire retardant is established. Thermogravimetric analysis (TGA) and differential scanning calorimetry (DSC) are used to determine thermostabilities. Results show that the fire retardant formulations are more thermally stable than the acrylic ink control. It is determined that an ink formulation containing a brominated phenol and carboxy-terminated butadiene acrylonitrile which has been modified with a brominated polymeric additive (BPA), yields the highest limiting oxygen index (LOI) of all the compounds tested. All of the fire-retardant formulations have a higher oxygen index than the baseline acrylic ink. Author

**THE 737 GRAPHITE COMPOSITE FLIGHT SPOILER FLIGHT SERVICE EVALUATION Report, May 1981 - Dec. 1984**
R. L. COGGESHALL Jul. 1985 84 p refs
(Contract NAS1-11668)
(NASA-CR-172600; NAS 1.26:172600; D6-53021; REPT-8) Avail: NTIS HC A05/MF A01 CSCL 11D

The flight service experience of 111 graphite-epoxy spoilers on 737 transport aircraft and related ground based environmental exposure of graphite-epoxy material specimens is covered. Spoilers have been installed on 28 aircraft representing seven major airlines operating throughout the world. An extended flight service evaluation program of 15 years is presently underway. As of December 1984, a total of 2,092, 155 spoiler flight hours and 2,954,814 spoiler landings had been accumulated by this fleet. Author

**ENVIRONMENTAL EXPOSURE EFFECTS ON COMPOSITE MATERIALS FOR COMMERCIAL AIRCRAFT Report, Apr. 1982 - Mar. 1985**
R. L. COGGESHALL Nov. 1985 82 p refs
(Contract NAS1-15148)
(NASA-CR-177929; NAS 1.26:177929; D6-53020) Avail: NTIS HC A05/MF A01 CSCL 11D

The effects of environmental exposure on composite materials are determined. The environments considered are representative of those experienced by commercial jet aircraft. Initial results have been compiled for the following material systems: T300/5208, T300/5209, and T300/934. Future results will include AS-1/3501-6 and Kevlar 49/F161-188. Specimens are exposed on the exterior and interior of 737 airplanes of three airlines, and to continuous ground-level exposure at four locations. In addition, specimens are exposed in the laboratory to conditions such as: simulated ground-air-ground, weatherometer, and moisture. Residual strength results are presented for specimens exposed for up to five years at five ground-level exposure locations and on airplanes from one airline. Author

(AD-A159974; NAEC-92-190) Avail: NTIS HC A06/MF A01 CSCL 17A

Composites are being used in high-strength, low-weight applications such as the aircraft industry. Difficulties arise in the nondestructive testing and evaluation of these materials because of their fibrous nature. Therefore, a study was connected to evaluate, improve, and optimize ultrasonic techniques for the detection of programmed delaminations and other defects in graphite/epoxy composite laminates. A pulse echo testing mode was used and C-scan results were analyzed. To overcome the limits of traditional C-scan, F-scanning (Feature scanning) was also used. This method examines many characteristic features of the ultrasonic waveform such as amplitude, frequency shifts, etc. Feature scanning has the potential to precisely locate and characterize the defects. Micrographic analyses were made to determine defective and good areas for correlation with the results obtain in the F-scan process. The results of the C-scan, F-scan, and photomicrographs showed an excellent correlation. Specific conclusions are drawn to assist future operators in conducting consistent and reliable C-scans. Situations where F-scanning might be suitable are also reviewed. Author (GRA)

**POWDERED, SINTERED ALLOY MATERIALS DESCRIBED: DEVELOPMENT OF TITANIUM ALLOYS**
M. YAMAZAKI and H. ONODERA *In its* Japan Report: Science and Technology (JPRS-JST-86-003) p 1-12 11 Feb. 1986 refs Transl. into ENGLISH from Kogyo Zairyo (Tokyo, Japan), v. 32, no. 13, Dec. 1984 p 25-31
Avail: NTIS HC A05/MF A01

As part of a system for the next generation, in parallel with the development of titanium alloys to meet the target performance of strength relative to high temperature (tensile strength/specific gravity), ductility and superplasticity properties, technological advances are studied for the manufacture of products such as compressor rotors with high yield, using superplasticity processing through powder metallurgy techniques. Techniques of alloy development as well as development status are explained, together with an outline of production techniques for components being studied at the Central Research Institute of Mitsubishi Metal Corporation. **MAGNETIC TAPE RECORDING UNDER SEVERE ENVIRONMENTAL CONDITIONS [MAGNETBANDAUFZEICHNUNG UNTER ERSCHWERTEN UMVELTBEDINGUNGEN]**
K. GROBBINK (Sangamo Electric GmbH, Essen, West Germany) IN: European Telemetry Conference, 7th, Boeblingen, West Germany, May 21-24, 1984, Reports. Part 1 . Wessling, West Germany, Arbeitskreis Telemetrie, 1984, p. 2.2-2.2.12. In German. refs

The design of magnetic tape recorders intended forse under severe environmental conditions is discussed. The requirements that must be met by such instruments and the particular stresses to which they are subject in use are examined. The components of a modern airborne tape recorder are described, including the tape drive, heads, current supply, power amplifier, and replay technology. C.D.

**AVIP AIR FORCE THRUST FOR RELIABILITY**

J. C. HALPIN (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) IN: Institute of Environmental Sciences, Annual Technical Meeting, 31st, Las Vegas, NV, April 30-May 2, 1985, Proceedings . Mount Prospect, IL, Institute of Environmental Sciences, 1985, p. 206-218.

Methods for ensuring reliability of electronics components (Avionics Integrity Programs or AVIPs) on board military aircraft are discussed. The general principles incorporated into environmental stress screening programs for electronics applications are described in detail. Among the screening programs considered are: burn-in stress screening simulating realistic aircraft stresses, and enhanced environmental stress screening to detect components having the worst flaws. A testing approach for characterizing fatigue failures in printed wiring boards is illustrated in a block diagram. I.H.

**EVOLUTION OF EMERGING ENVIRONMENTAL TESTING AND EVALUATION TECHNIQUES**

A. H. BURKHARD (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) IN: Institute of Environmental Sciences, Annual Technical Meeting, 31st, Las Vegas, NV, April 30-May 2, 1985, Proceedings . Mount Prospect, IL, Institute of Environmental Sciences, 1985, p. 302-309. refs

The contemporary statistically based environmental test and evaluation techniques used to develop and qualify electronic systems will be too costly and time consuming for emerging equipment systems with much higher levels of reliability than current systems. The current emphasis on physical testing needs to be reduced and blended with the emerging analytical computerized tools to develop a more cost effective approach to evaluate the environmental suitability of electronic systems. It is proposed that an integrated approach based upon fracture mechanics concepts of latent defects growth and/or a nondestructive inspection techniques could yield such an approach. Author

**UNSCREENED PART RELIABILITY RIVALS THAT OF SCREENED PARTS IN NEW DIGITAL AVIONICS**

T. R. BRENNOM (Rockwell International Corp., Collins Avionics Div., Cedar Rapids, IA) IN: Institute of Environmental Sciences, Annual Technical Meeting, 31st, Las Vegas, NV, April 30-May 2, 1985, Proceedings . Mount Prospect, IL, Institute of Environmental Sciences, 1985, p. 332-336.

Early field operational data of Collins products on new Boeing 767 and 757 aircraft has shown stadard, full temperature range electrical parts have similar reliability levels as high reliability/screened electrical parts. This study is considered to be unique in that the only significant variable was part screening. Historical background into the use of failure rate sources at the Collins Avionics Divisions including some early screened part reliability results are included. Comparisons are made of actual and predicted field reliability levels of piece part failure rate data from early operation of the new Collins 700 Series Digital Products. A brief description of future needs in this area is also presented. Author

**AIRBORNE INSTRUMENTATION MAGNETIC TAPE RECORDING THRU THE EARLY 90'S**

W. D. WESSLER (Fairchild Weston Systems, Inc., Sarasota, FL) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 1-1 to 1-5.

Today's state-of-the-art airborne instrumentation tape recording is reviewed as background. Advantages and limitations of magnetic tape, as compared to other storage medium are considered, then practical present day longitudinal and helical recording is discussed. Following this a recorder manufacturer's projection of what the Flight Test Engineer can expect thru the early 1990's is presented. Bit rate, error rates, areal and volumetric packing densities as well as recorder weights and dimensions are considered. Author

**USE OF VIDEO CASSETTE RECORDERS FOR COMBINED VIDEO AND PCM DATA RECORDING**

R. J. MCQUILLAN (USAF, Flight Test Center, Edwards AFB, CA) and L. GALLO (Merlin Engineering Works, Palo Alto, CA) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 5-1 to 5-5.

Analog tape recorders are commonly used in aircraft flight testing to record PCM digital data. These recorders require considerable space and add significantly to the cost of test instrumentation. For limited test programs in densely packed aircraft, such as the modern fighter, the burden of a conventional reel to reel analog recorder is oppressive. With this condition in mind, the desirability of recording PCM data on a video cassette recorder surfaced. The video cassette recorder (VCR) offers greatly improved size and cost efficiency over conventional reel to reel recorders for many data acquisition requirements. Not only are cost and size improved, but several other benefits are realized. For instance, video cassettes are easily stored and transported. Automatic synchronization of the digital data and video images is inherent in the combined recording system. The system described in this paper makes use of a small electronic interface unit to combine and synchronize the video and PCM data signals. This composite signal is then recorded on a standard VHS video recorder. PCM data rates of up to thirty kilobits per second can be accomodated with only a minor reduction of picture area. Author

**A NEW HIGH TEMPERATURE SILICON ON SAPPHIRE TRANSDUCER FOR JET ENGINE CONTROL APPLICATIONS**

A. J. PETERS (Bourns Instruments, Inc., Riverside, CA) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 15-1 to 15-4.

A new pressure transducer has been designed using silicon on sapphire technology. This transducer has been primarily designed for use in jet aircraft monitoring and control applications. The heart of this device is a single crystal sapphire substrate with epitaxially deposited silicon strain gages in intimate contact with the sapphire. The sapphire substrate becomes the pressure sensitive diaphragm and the strain gage resistance change is directly proportional to applied pressure. The transducer exhibits excellent linearity and low hysteresis due to the crystalline nature of the diaphragm. The transducer is fabricated using materials that have excellent thermal expansion match properties and is capable of operating at temperatures up to 500 degrees Fahrenheit. A means of monitoring diaphragm temperature is also included in the design. This paper contains a complete description of the fabrication process and the performance characteristics of this new device. Author

### AIR FLOW AND PARTICLE TRAJECTORIES AROUND AIRCRAFT FUSELAGES. III - EXTENSIONS TO PARTICLES OF ARBITRARY SHAPE

W. D. KING (National Center for Atmospheric Research, Boulder, CO) Journal of Atmospheric and Oceanic Technology (ISSN 0739-0572), vol. 2, Dec. 1985, p. 539-547. refs

Earlier work that produced generalized rules for obtaining trajectories of water droplets moving around aircraft fuselages has been extended to cover the case for particles of arbitrary shape. The parameters determining the major features of the trajectories are the fuselage radius and a generalized Stokes number that can be used to calculate an equivalent water drop size for particles of arbitrary shape and density. As for water drops, the maximum width of the shadow zone for sampling the particles is about one-fifth of the fuselage radius, and it occurs for those ice columns and plates of typical densities whose major dimensions are about 600 microns and 2 mm, respectively. Author

### PREDICTION AND MEASUREMENT OF NEAR FIELDS FOR ANTENNAS ON STRUCTURES

L. C. CALMON (University College, London, England) and M. S. SMITH (Standard Telecommunication Laboratories, Ltd., Harlow, England) Institution of Electronic and Radio Engineers, Journal (ISSN 0267-1689), vol. 55, Nov.-Dec. 1985, p. 407-414. refs

Techniques for predicting near fields of antennas on limited ground planes, aircraft and other vehicles, have been developed. Wire grid modelling is used to calculate the current distribution over the metal structure, from which the fields close to the surface can be found. These field values could then be used in a quasi-static analysis to predict aperture penetration fields, with application to electromagnetic compatibility. A new form of electric field probe with an optical fibre link has been developed, which has been used to obtain experimental measurements to compare with the theoretical predictions. The agreement obtained is very close, confirming the theory and showing that the probe gives unperturbed and accurate measurements. Author

### CALCULATION OF THE HEATING OF A LIQUID COMPONENT PARTIALLY FILLING A CONTAINER [RASCHET PROGREVA ZHIDKOGO KOMPONENTA, CHASTICHNO ZAPOLNIAIUSHCHEGO REZERVUAR]

N. L. BACHEV and A. A. KOZLOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 3, 1985, p. 13-17. In Russian.

The convective flux toward the free surface of the fuel tanks of aircraft on the ground or in flight produces convective flows in the liquid fuel and leads to the stratification of the liquid. Here, the flows of this kind are analyzed by solving numerically nonstationary equations of thermal convection without any assumptions concerning the flow structure. By using this approach, the heating of the liquid is determined for Re up to 7 x 10 to the 11th. V.L.

### SURFACES ON A NONRECTANGULAR FRAME [POVERKHNOSTI NA NEPRIAMOUGOL'NOM KARKASE]

A. D. TUZOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 3, 1985, p. 66-70. In Russian.

A method is presented for constructing a surface over a frame consisting of a set of nonrectangular areas whose opposite boundaries are of different parametric length. Equations for the portions of the surface are obtained by using the Boolean sum and tensor product methods. The equations presented here yield, as a particular case, a well-known equation for a rectangular region. V.L.

**A86-23666**

### A QUICK METHOD FOR ESTIMATING HEAT TRANSFER TO A COOLANT [EKSPRESS-METOD OTSENKI TEPLOOTDACHI V OKHLADITEL']

A. B. SHIGAPOV and E. A. DAUTOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 3, 1985, p. 79-84. In Russian. refs

A special nomogram and graphs are presented which provide a convenient way to calculate heat transfer to the coolant in ducts with a developed heat transfer surface, such as the cooling channels of aircraft engines. The method proposed here makes it possible to significantly reduce the time and effort required for calculating flow-type engine cooling systems. The method can be used for approximate estimates at the stage of preliminary design. V.L.

**A86-23755**

### IN SITU METHODS FOR CRACK DETECTION IN THE MASTER CONNECTING RODS OF M 462 RF AIRCRAFT ENGINES [BEZDEMONTAZNI METODY ZJISTOVANI TRHLIN V HLAVNICH OJNICICH LETECKYCH MOTORU M-462 RF]

R. SYKORA Zpravodaj VZLU (ISSN 0044-5355), no. 3, 1985, p. 165-171. In Czech.

The following methods are examined to determine their suitability for in situ crack detection in the master connecting rods of aircraft engines: (1) analysis of the vibration spectra from the cylinder containing the master connecting rod during engine operation; (2) analysis of the noise spectra and their changes with time during engine operation; and (3) analysis of the spectra of acoustic signals generated by impacts on the master connecting rod. Recorded spectra and frequencies characterizing cracks in the master connecting rods are presented. It is shown that each of the methods studied is capable of detecting cracks in master connecting rods. V.L.

**MEASUREMENT OF TURBINE BLADE TEMPERATURE USING PYROMETER**

H. CHENG and C. DU (Shenyang Aeroengine Research Institute, People's Republic of China) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 7 p. refs
(ASME PAPER 85-IGT-78)

This paper presents the study of application of a self-made turbine blade pyrometer to measuring rotating turbine blade temperatures in a bed testing aeroengine. The study includes the temperature measuring principle and the pyrometer system; installation and adjustment of the double ball-floating type configuration optical head which goes through four different high temperatures bulkheads; and measurement of three kinds of temperature (the average blade temperature Ta, the average peak blade temperature Tap, and the maximum peak blade temperature Tmp) for all rotor blades of the turbine first stage. The experimental data analysis reveals that the first attempt of application of this pyrometer is successful. The measurement errors in the temperature range of 550-1200 C are within + or - 1 percent of calculated blade temperatures. Author

**THE SOLUTION OF THE THERMAL ELASTIC-PLASTIC PROBLEM OF TURBINE DISK BY THE INCREMENTAL FINITE ELEMENT METHOD**

S.-J. WEN (Shanghai University of Engineering and Technology, People's Republic of China), O. CHANG, and J.-Y. FANG (Fudan University, Shanghai, People's Republic of China) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 6 p. refs
(ASME PAPER 85-IGT-112)

In this paper, a stress analysis method and a computation program of the solution for the thermal elastic-plastic problem of a turbine disk in an aeroengine are presented by incremental finite element method. The method, which is suitable for the axisymmetric disk in the gas turbine, compressor, and steam turbine as well, may be used to compute the stress and displacement of a turbine disk at its thermal elastic or thermal elastic-plastic stage, its cracking revolving speed and limit load capacity, and the part which enters into the plastic zone first. The method may be used to compute the leading and unleading process, residual stress, and displacement, as well. It is important to analyze the strength of the turbine disk and its fracture characteristics. Author

**THE USE OF LASERS IN GAS TURBINE MANUFACTURING**

D. S. DUVALL (United Technologies Corp., Pratt and Whitney Div., East Hartford, CT) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 7 p. refs
(ASME PAPER 85-IGT-141)

The laser is being increasingly used as a manufacturing tool in the fabrication of aircraft gas turbine engine components. Both solid-state pulsed and gas continuous-wave lasers are employed for a variety of manufacturing tasks including welding, cutting, hole drilling, surface alloying, and marking of parts for identification. In these applications, the laser provides increased productivity and reduced cost compared to conventional methods. Examples of specific uses of the laser in gas turbine fabrication are described along with the benefits achieved. Metallurgical effects associated with various laser processes are also discussed. Author

**A86-23944#**

**THE EFFECT OF COMPRESSIBILITY ON SLENDER VORTICES [DER EINFLUSS DER KOMPRESSIBILITAET AUF SCHLANKE WIRBEL]**

E. KRAUSE Rheinisch-Westfaelische Technische Hochschule, Aerodynamisches Institut, Abhandlungen, no. 27, 1985, p. 19-23. In German. refs

There is no or little information regarding studies concerned with the effect of compressibility on slender vortices and the vortex breakdown in compressible flows. However, detailed knowledge of the breakdown process in compressible flows is required to avoid uncontrollable flight conditions, in particular, in the case of aircraft with delta wings. In the present study, the attempt is made to provide a representation of the influence of compressibility on slender vortices. The employed approximation of the equations of motion makes it impossible to calculate the position of the breakdown point accurately. However, it is still feasible to determine in the analysis the most important differences with respect to the incompressible flow. A summary is provided of the results reported by Krause (1983, 1985) for slender vortices in incompressible flow, and the obtained corresponding relations for compressible flows are discussed. It is found that the breakdown of slender vortices in compressible flow is less rapid than in incompressible flow. G.R.

### COMPARISON OF TWO TARGET CLASSIFICATION TECHNIQUES

J. S. CHEN and E. K. WALTON (Ohio State University, Columbus) IEEE Transactions on Aerospace and Electronic Systems (ISSN 0018-9251), vol. AES-22, Jan. 1986, p. 15-22. Research supported by the Ohio State University Research Foundation. refs
(Contract N00014-82-K-0037)

Radar target classification techniques based on backscatter measurements in the resonance region (1.0-20.0 MHz) are discussed. Attention is given to two novel methods currently being tested at the radar range of Ohio State University. The methods include: (1) the nearest neighbor (NN) algorithm for determining the radar cross section (RCS) magnitude and range corrected phase at various operating frequencies; and (2) an inverse Fourier transformation of the complex multifrequency radar returns of the time domain, followed by cross correlation analysis. Comparisons are made of the performance of the two techniques as a function of signal-to-error noise ratio for different types of processing. The results of the comparison are discussed in detail. ### THE VISCOELASTIC DAMPING TECHNOLOGY DESIGN GUIDE FOR AEROSPACE STRUCTURES

V. R. MILLER (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH), M. L. DRAKE (Dayton, University, OH), and J. SOOVERE (Lockheed-California Co., Burbank) ASME, Design Engineering Technical Conference, Cincinnati, OH, Sept. 10-13, 1985. 4 p. USAF-sponsored research.
(ASME PAPER 85-DET-104)

Viscoelastic damping technology has reached a state of maturity in which it serves as a design tool for the effective solution of resonant vibration problems. Unexpected vibration problems can therefore be solved without resort to extensive structural design modifications. A viscoelastic damping design guide is now available as Air Force Wright Aeronautical Labs TR-84-3089, 'The viscoelastic damping technology design guide for aerospace structures'. O.C.

### INTERACTIVE MODAL IMAGING PROCESS FOR VIBRATING STRUCTURES

D. K. RAO (USAF, Materials Laboratory, Wright-Patterson AFB, OH) ASME, Design Engineering Technical Conference, Cincinnati, OH, Sept. 10-13, 1985. 12 p. Research sponsored by the National Research Council. refs
(ASME PAPER 85-DET-110)

A major objective of Experimental Modal Analysis is to extract and display mode shapes of a structure. This paper presents development of a mode measurement method, called Modal Imaging Process (MIP). This is an on-line process that develops and displays the Modal Image of a Vibrating Structure directly. It uses roving vibration transducer(s) to measure amplitude and phase of vibrations at selected Surface Points. These transducers are integrated into a microcomputer which instantaneously creates/updates the Modal Image of the structure. Display of direct image of the vibrating structure will help the user to locate and correct any measurement errors on the spot, and view its true mode shape. Application of MIP to few aerospace structures are presented, and mode shapes measured by this method are compared with those displayed by offline FFT techniques. The MIP software is written in FORTRAN so that it can run on most of the inexpensive microcomputers. Author

### RESULTS OF RECENT RESEARCH ON DAMPED FAN BLADES

M. F. KLUESENER (Dayton, University, OH) and D. R. OETH (General Motors Corp., Allison Gas Turbine Div., Indianapolis, IN) ASME, Design Engineering Technical Conference, Cincinnati, OH, Sept. 10-13, 1985. 8 p. refs
(Contract F33615-82-C-5022)
(ASME PAPER 85-DET-133)

Gas turbine engine airfoil high cycle fatigue failures are the result of forced or flutter-induced vibration. These vibration problems have been solved in some cases by using part-span shrouds. Recent advances in vibration damping technology indicate that additive damping techniques are a promising alternative to part-span shrouds. Evaluations were made of techniques and materials for providing high levels of intrinsic damping in the vibration modes of a gas turbine engine fan blade such that the part-span shrouds could be eliminated. An airfoil external constrained layer damping system was designed for the presently shrouded TF41 engine first-stage LP compressor blade to provide an additional system damping loss factor of 0.017, the analytically determined minimum required for flutter-free operation and acceptable forced response levels. An external damping system was applied to the blade, and the levels of modal damping achieved were experimentally measured. Author

### AUTOPARAMETRIC VIBRATION OF COUPLED BEAMS UNDER RANDOM SUPPORT MOTION

R. A. IBRAHIM (Texas Tech University, Lubbock) and H. HEO ASME, Design Engineering Technical Conference, Cincinnati, OH, Sept. 10-13, 1985. 8 p. refs
(Contract AF-AFOSR-85-0008)
(ASME PAPER 85-DET-184)

The dynamic response of a two degree-of-freedom system with autoparametric coupling to a wide band random excitation is investigated. The analytical modeling includes quadratic non-linearity, and a general first order differential equation of the moments of any order is derived. It is found that the movement equations form an infinite hierarchy set which is closed via two different closure methods. These are the Gaussian closure and the non-Gaussian closure schemes. The Gaussian closure solution shows that the system does not reach a stationary response while the non-Gaussian closure solution gives a complete stationary steady state response. In both cases the response is obtained in the neighborhood of the autoparametric internal resonance condition for various system parameters. Author

### MEASUREMENTS ACCURACY WITH 3D LASER VELOCIMETRY

A. BOUTIER, D. PAGAN, and D. SOULEVANT (ONERA, Chatillon-sous-Bagneux, France) (International Conference on Laser Anemometry - Advances and Application, Manchester, England, Dec. 16-18, 1985) ONERA, TP, no. 1985-171, 1985, 15 p. refs
(ONERA, TP NO. 1985-171)

Accuracy problems that arise in connection with the simultaneous measurement of the three local velocity components using a 3D laser velocimeter (LV), when the 3rd component is obtained by combining two copianar components, are examined. The various ways to set up a 3D LV are summarized, and a particular fringe, three-color LV, with signals processed by counters, is described in more detail. Sources of error are analyzed, and ways to minimize them are considered. The successful application of an existing LV to study vortex breakdown downstream of a delta wing is reported. C.D.

**ROBOTIC APPLICATIONS TO AUTOMATED COMPOSITE AIRCRAFT COMPONENT MANUFACTURING**
B. SARH (Rohr Industries, Inc., Riverside, CA) Society of Manufacturing Engineers, Conference on Fabricating Composites, Hartford, CT, June 11-13, 1985. 18 p.
(SME PAPER MF85-506)

This paper considers robotic applications in aircraft prepreg composite structure fabrication. The process steps involved in automated prepreg production are described with a focus on process efficiency. For a typical composite structural shell, the number of different preprep pieces used is compared to the number of parts involved in a conventional metal structure, and the potential for automated production is shown. Specific process times and efficiencies for the process steps in fabricating a composite aircraft shell are calculated. Author

**ELECTRIC POWER MANAGEMENT AND DISTRIBUTION FOR AIR AND SPACE APPLICATIONS**
B. MEHL and E. HENDERSON (Sundstrand Corp., Rockford, IL) IN: Intersociety Energy Conversion Engineering Conference, 20th, Miami Beach, FL, August 18-23, 1985, Proceedings. Volume 1 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 1.374-1.381. refs

The historical growth of electric power systems for aircraft and space applications is briefly reviewed, and the technical issues involved in electric power management and distribution are discussed. The discussion covers bus architectures, power management components, power system controls, autonomous power management, transient reduction, and autonomous system reconfiguration. Particular attention is given to advanced electric power systems concepts and alternative implementations. V.L.

**A86-24829**
**EFFICIENTLY MEETING ELECTRIC POWER NEEDS FOR FUTURE AIRCRAFT**
I. S. MEHDI and P. J. LEONG (Boeing Military Airplane Co., Seattle, WA) IN: Intersociety Energy Conversion Engineering Conference, 20th, Miami Beach, FL, August 18-23, 1985, Proceedings. Volume 1 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 1.382-1.387.

Electric power in modern aircraft is becoming more and more important not only for powering essential systems but also to keep the aircraft in control. Stability Augumentation Systems in fly-by-wire aircraft cannot tolerate power interruptions as loss of power would cause loss of control of the aircraft itself. This paper describes the needs of the avionics and flight control systems in terms of quantity and quality of electric power required. Special requirements such as uninterruptible electric power and ultra-high reliability will be defined. These requirements will have to be met by incorporation of special features in the power generation and distribution systems, the control and protection and the utilization systems. It is significantly easier to provide uninterruptibility in dc-powered equipment. Author

**A NEW DIRECTION IN ENERGY CONVERSION - THE ALL-ELECTRIC AIRCRAFT**
C. R. SPITZER (NASA, Langley Research Center, Hampton, VA) IN: Intersociety Energy Conversion Engineering Conference, 20th, Miami Beach, FL, August 18-23, 1985, Proceedings. Volume 1 . Warrendale, PA, Society of Automotive Engineers, Inc., 1985, p. 1.388-1.393. refs

This paper reviews recent studies of all-electric aircraft that use electric-only secondary power and flight critical fly-by-wire flight controls, and brings to the attention of the power system designer the intrinsic advantages of such aircraft. The all-electric aircraft is made possible by the development of rare earth magnet materials and fault tolerant systems technologies. Recent studies have shown all-electric aircraft to be more efficient than conventional designs and offer substantial operating costs reductions. Compared to present aircraft, an all-electric transport can save at least 10 percent in fuel burn. The cornerstone of an all-electric aircraft is the electric secondary power system. This paper reviews the major features of flight critical electric secondary power systems. Research required to lay the foundation for an all-electric aircraft is briefly discussed. Author

**COMMUNICATION WITH LAND VEHICLES AND AIRCRAFT VIA SATELLITE [KOMMUNIKATION MIT LANDFAHRZEUGEN UND FLUGZEUGEN UEBER SATELLIT]**
J. HAGENAUER and E. LUTZ (DFVLR, Institut fuer Nachrichtentechnik, Oberpfaffenhofen, West Germany) DFVLR-Nachrichten (ISSN 0011-4901), Nov. 1985, p. 15-20. In German.

The present article is concerned with the feasibility to utilize satellites as a basis for large-area or even worldwide networks providing communication services to mobile participants in land vehicles, on ships, in aircraft, and in emergency situations. The current situation with respect to the considered communication services is examined, taking into account also the International Maritime Satellite Organization Inmarsat. An antenna with a size of about 10 cm would be sufficient for the smallest terminal on a ship. Antennas with such small dimensions would also be suitable for a use in the case of aircraft, automobiles, and emergency messages. Problems are related to the development of cost-efficient equipment; and research conducted by the DFVLR to overcome these problems is discussed. Developments regarding the satellite-aided communication with land vehicles are described, along with the advantages of satellite-aided communication in the case of aircraft. An improvement of communication with aircraft over the North Atlantic would make it possible to increase air traffic density and save fuel. G.R.

**A86-25751**
**EQUIVALENT STIFFNESS AND DAMPING COEFFICIENTS FOR SQUEEZE FILM DAMPERS**
E. J. HAHN (New South Wales, University, Kensington, Australia) IN: International Conference on Vibrations in Rotating Machinery, 3rd, Heslington, England, September 11-13, 1984, Proceedings . London, Mechanical Engineering Publications, Ltd., 1984, p. 507-514. refs

In aircraft engines, squeeze film dampers are increasingly used to achieve stabilization or appropriate vibration attenuation. Difficulties regarding the conduction of design studies can arise, because the damper forces are nonlinear functions of velocity and displacement. The present study is, therefore concerned with a general technique for linearizing the nonlinear element forces. The approach adopted for evaluating equivalent stiffness and damping coefficients employs energy dissipation and energy storage-release concepts. Attention is given to equivalent stiffness and damping coefficients, centrally preloaded dampers, a damper without centralizing spring - rigid rotor, and the application of the considered procedure to a general multimass rotor bearing system with a squeeze film damper. G.R.

**GYROSCOPES MAY CEASE SPINNING**
G. J. MARTIN (Litton Industries, Guidance and Control Systems Div., Woodland Hills, CA) IEEE Spectrum (ISSN 0018-9235), vol. 23, Feb. 1986, p. 48-53. refs

Laser gyroscopes have advantages compared to mechanical gyroscopes. Thus, they are more rugged and reliable, and, therefore, offer lower life-cycle costs. They are not yet more accurate than high-quality mechanical systems, but they have excellent development potential. Problems which can arise in the case of the spinning-rotor systems are related to their sensitivity to gravitational fields in the increasingly high-g environment of modern military aircraft. Optically based systems, on the other hand, have, in principle, no gravitational sensitivity and are in addition highly linear over a large dynamic range. The principles of operation of ring laser gyros (RLG) are discussed, taking into account the utilization of the Sagnac effect. Attention is given to the approaches found to overcome a number of engineering difficulties which arose in connection with the construction of RLG, techniques for limiting laser beam competition, aspects of geometry, and the current state of the art. G.R.

**THREE COMPONENT HOT-WIRE MEASUREMENTS IN THE WAKE OF A ROTOR MODEL**
S. DE PONTE, A. BARON (Milano, Politecnico, Milan, Italy), and B. MIGNEMI (Italtel - Societa Italiana Telecomunicazioni S.p.A., Milan, Italy) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 10 p.

According to previous experience in hot-wire measurements in the flowfield of a rotor model in hover conditions, the paper describes problems connected with experiments of this kind and their possible solutions. In particular, it deals with the reliability of directional measurements related to triple hot-wire probes, the data validation procedure and validity of experimental results, the choice of probe orientation and some useful way of presenting the results in graphical form. Furthermore, the paper discusses one way to analyze the signal in statistical form in order to reconstruct turbulent or vortical structures without the usual 'smoothing' associated with ensemble averages due to the long-period 'wandering' of the wake. **THE DESIGN OF AN ADVANCED ENGINEERING GEARBOX**
H. COCKING (Westland, PLC, Helicopter and Hovercraft Group, Yeovil, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 17 p. Research supported by the Ministry of Defence of England.

Equations are presented which show that gear and gearbox weights are proportional to the torque on the gear and gearbox respectively. An element of these equations called the 'configuration factor' can be derived from the gearing layout, and then used as a comparison of gearbox weights. Using this configuration factor, three features essential to any low weight gearbox have been identified. All triple reduction layouts, many using these three factors, have been analyzed using the configuration factor technique and a particular low weight configuration identified. The weight of this new configuration has been predicted and verified by traditional means and shows a 38 percent weight saving when compared to the existing Sea King Gearbox. Development programs are now nearing completion to enable this configuration to be incorporated into improved versions of certain current helicopters and new designs. Author

**REMOTE SENSING OF OIL ON SEA: LIDAR AND PASSIVE IR EXPERIMENTS**
F. CASTAGNOLI, G. CECCHI, L. PANTANI, I. PIPPI, B. RADICATI, C. SUSINI, P. MAZZINGHI, and A. BARBARO *In* ESA Proceedings of EARSeL/ESA Symposium on European Remote Sensing Opportunities: Systems, Sensors, and Applications p 121-126 Jun. 1985 refs
Avail: NTIS HC A12/MF A01

A compact system for detecting and monitoring oil pollution on the sea from light aircraft using passive infrared remote sensing was developed. Lidar marine environment and pollution monitoring potential was assessed in the laboratory. The low-power airborne system is suitable for day and night operations in quite good weather. It performs a real time detection of the oil, a mapping of the spill, and an identification of its thickest parts. A suitable Lidar system can be composed by an XeCl excimer laser with small dimensions, a low energy consumption, and 50 mJ energy per pulse. The detection system does not require an optical multichannel analyzer, but it is possible to operate with only three interferential filters: one for Raman scattering signal, the others for fluorescence signals, which are sufficient to identify the oil class. **THE EFFECTS OF VOCAL VERSUS MANUAL RESPONSE MODALITIES ON MULTI-TASK PERFORMANCE Interim Report**

G. R. GRIFFIN and J. D. MOSKO Feb. 1985 17 p
(Contract F58-528)
(AD-A159830; NAMRL-1312) Avail: NTIS HC A02/MF A01 CSCL 05J

The increasing complexity of display and control instrumentation in modern high performance aircraft has the potential to overload the human operator and result in diminished system performance. Interactive voice technology has been proposed as a method to reduce the high workload placed on the pilots of military aircraft. This report presents the results of an experiment designed to evaluate the effects on human performance of vocal versus manual response modalities on single and multiple tasks simulating some conditions of flight. Results indicated a significant increase in performance precision on a psychomotor task when a vocal, rather than a manual response mode was used on the simultaneous performance of multiple tasks. These results suggest that human performance on visually oriented multiple tasks requiring simultaneous execution may be improved if some of the work effort can be performed using a vocal input/output. **EFFECTS OF NOISE AND WORKLOAD ON A COMMUNICATION TASK**

D. H. ORRELL, II May 1985 81 p
(AD-A160743; AFIT/CI/NR-85-101T) Avail: NTIS HC A05/MF A01 CSCL 17B

Communication is of vital importance in the cockpit today. It is essential for pilots to be able to understand the messages sent to them. A major requirement of any aircraft voice communication system is the ability to deliver intelligible speech. In a loose sense, intelligibility may be defined as the understanding of spoken words (Webster, 1979). Several language factors affect intelligibility including vocabulary size, word frequency (familiarity) effects, number of response alternatives, number of syllables, phonetic elements and context (Webster, 1972). Other external considerations include equipment or design features and environment (Webster and Allen, 1972). With such a wide range of sources of influence, it is easy to understand the need for a reliable intelligibility test. One such test found to be particularly useful in studying the effects of aircraft noise has been the Modified Ryhme Test (MRT). GRA

**A COMPARATIVE EVALUATION OF THE RELIABILITY IMPROVEMENT IN LINE REPLACEABLE UNITS WARRANTED UNDER THE F-16 RELIABILITY IMPROVEMENT WARRANTY M.S. Thesis**

S. J. LEMKE Sep. 1985 98 p
(AD-A160830; AFIT/GLM/LSP/85S-44) Avail: NTIS HC A05/MF A01 CSCL 09C

This thesis examined the effects a reliability improvement warranty (RIW) had on the actual operational reliability of the warranted avionics equipment. To accomplish this, the most comprehensive DOD application of RIW to date, the F-16 RIW, was investigated. This study was designed to answer the question of whether or not a warranted weapons system was significantly more reliable than it would have been without the warranty. Specifically, the observed mean flight hours between failures (MFHBFs) and the observed reliability growths of the warranted F-16 equipment were compared to those of functionally similar non-warranted F-15 equipment. Also, the reliability growth of the F-16 warranted equipment was compared to that of other non-warranted F-16 equipment. The AMSAA Reliability Growth Model was used as a basis for the reliability growth analyses. Comparable life cycle time periods for each aircraft were studied, using AFM 66-1 D056 failure and flight time data. The results of the investigation indicated that, in general, the observed MFHBFs of the F-16 warranted equipment were statistically greater than the MFHBFs of the equivalent F-15 equipment. The same could not be concluded for the reliability growths of the F-16 and equivalent F-15 equipment. However, the reliability growth of the warranted F-16 equipment was found to be statistically greater than the reliability growth of the non-warranted F-16 equipment. Author (GRA)

**PERFORMANCE OF RESONANT RADAR TARGET IDENTIFICATION ALGORITHMS USING INTRA-CLASS WEIGHTING FUNCTIONS Ph.D. Thesis**

A. MUSTAFA 1985 226 p
Avail: Univ. Microfilms Order No. DA8518995

The use of calibrated resonant-region radar cross section (RCS) measurements of targets for the classification of large aircraft is discussed. Errors in the RCS estimate of full scale aircraft flying over an ocean, introduced by the ionospheric variability and the sea conditions were studied. The Weighted Target Representative

(WTR) classification algorithm was developed, implemented, tested and compared with the nearest neighbor (NN) algorithm. The WTR-algorithm has a low sensitivity to the uncertainty in the aspect angle of the unknown target returns. In addition, this algorithm was based on the development of a new catalog of representative data which reduces the storage requirements and increases the computational efficiency of the classification system compared to the NN-algorithm. Experiments were designed to study and evaluate the characteristics of the WTR- and the NN-algorithms, investigate the classifiability of targets and study the relative behavior of the number of misclassifications as a function of the target backscatter features. The classification results and statistics were shown in the form of performance curves, performance tables and confusion tables. Author

**STUDY ON THE DIGITAL POSITION TRANSDUCER WITH OPTICAL TIME-DELAY PULSE**

M. MAYANAGI Sep. 1985 40 p refs In JAPANESE; ENGLISH summary

(NAS-TR-878; ISSN-0389-4010) Avail: NTIS HC A03/MF A01

A rotary optical position transducer employing a pulse technique time-multiplexor has been studied during the development of a Fly-By-Light (FBL) for the aircraft control system, the aim of which is to offer inherent resistance to environments of electromagnetic interference (EMI), electromagntic pulse (EMP) and lightening. The conventional absolute-type optical digital transducer causes difficulty in the interface technique between the transducer and other devices such as a computer. The transducer system described in this paper, which consists of a rotary position transducer unit, a fiber-optic cable, a light source unit, and an electronics interface unit, can improve this interface technique. The rotary transducer unit is an electrically passive device that is connected through optical fibers to the light source unit and the electronics interface unit, and that has many advantages of fiber-optic techniques. This paper studies basic problems in the development of the rotary transducer system. In particular, a basis for optimizing illumination irradiance and photo-detector characteristics is given, and the intrinsic performance of the transducer is quantitatively examined. Author 21

**FATIGUE CRACK PROPAGATION UNDER SPECTRUM LOADING**

R. SUNDER Mar. 1985 21 p refs

(NAL-TM-MT-8502) Avail: NTIS HC A02/MF A01

This project involved development of a method to predict the fatigue crack propagation process in thin-walled aircraft structural components under flight-by-flight loading. Extensive experimental test results provided the input for software development. They yielded evidence pointing to the complex nature of crack growth under spectrum loading and also provided the basis for procedures adopted for life prediction. A simple engineering method is proposed for estimating fatigue crack propagation life under random loading. Predictions are based on test data obtained under constant amplitude loading. Prediction accuracy favourably compares with that of available techniques. Computation time is extremely small, enabling the use of desktop computer for life predictions. Author

**FUNDAMENTAL INVESTIGATION ON THE IMPACT STRENGTH OF HOLLOW FAN BLADES**

T. IKEDA, T. MIYACHI, and Y. SOFUE Sep. 1985 23 p refs In JAPANESE; ENGLISH summary

(NAL-TR-879; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

Models of hollow fan blades were made and tested to prove that their strength is sufficient for use in real engines. The hollow blades were fabricated by diffusion bonding of two titanium alloy (6Al-4V-Ti) plates, one of which had three spanwise stiffners and the other being flat plate. The model was a non-twisted tapered blade. Impact tests were carried out on the hollow fan blade models in which the ingestion of a 1.5 pound bird was simulated. Solid blades with the same external form were also tested by similar methds for comparison. The results of these tests show that properly designed hollow blades have sufficient stiffness and strength for use as fan blades in the turbo-fan engine. Author

**APPLICATION OF MATHEMATICAL OPTIMIZATION PROCEDURES TO A STRUCTURAL MODEL OF A LARGE FINITE-ELEMENT WING**

J. L. WALSH Jan. 1986 43 p refs

(NASA-TM-87597; L-15930; NAS 1.15:87597) Avail: NTIS HC A03/MF A01 CSCL 20K

An optimization system is described that consists of the finite-element analysis program known as Engineering Analysis Language (EAL), the CONMIN optimization program, and a piecewise linear analysis. The optimization analysis system (OPTEAL) is used to minimize the mass of a transport wing subject to stress constraints for two static load conditions. The optimization procedure and the optimization analysis system (OPTEAL) are described and the optiomized results with fully stressed design results compared. Author

**AIRCRAFT FLOW EFFECTS ON CLOUD DROP IMAGES AND CONCENTRATIONS MEASURED BY THE NAE TWIN OTTER**

A. M. DRUMMOND and J. I. MACPHERSON (National Aeronautical Establishment, Flight Research Laboratory, Ottawa, Canada) Journal of Atmospheric and Oceanic Technology (ISSN 0739-0572), vol. 2, Dec. 1985, p. 633-643. refs

A theoretical model for the local flow velocity ahead of the wing quarter-chord point on the National Aeronautical Establishment Twin Otter has been developed and experimentally verified by flight measurements using a pitot-static equipped Particle Measuring Systems (PMS) canister. This flow velocity model was used to calculate drop trajectories and the resulting airflow effects on drop images and concentrations. Results indicate that drop images and concentrations measured by the Twin Otter are distorted in the worst case by no more than 25 percent for an unusually high aircraft lift coefficient of 0.79, and by only a few percent for lower values of this coefficient typical of normal flight. A method to correct water drop images and concentrations is described and results for a PMS probe mounted at one underwing station are presented. Author

**COMPARISON OF SEA SURFACE TEMPERATURES OBTAINED FROM AN AIRCRAFT USING REMOTE AND DIRECT SENSING TECHNIQUES**
P. A. SPYERS-DURAN (National Center for Atmospheric Research, Boulder, CO) and C. D. WINANT (California, University, La Jolla) Journal of Atmospheric and Oceanic Technology (ISSN 0739-0572), vol. 2, Dec. 1985, p. 667-671. refs
(Contract NSF OCE-83-10639)

A comparison of sea surface temperatures is made between aircraft precision radiation thermometer (PRT-5) and aircraft deployed expendable bathythermographs (AXBT) drops. These observations were obtained using the NCAR King Air aircraft for an experiment in the Gulf of California during March 1984. The average difference between the sea surface temperatures reported by the first temperature observed in each AXBT drop and the PRT-5 is -0.07 C with a standard deviation of 0.57 C. The difference in temperature between the two observations increases at lower wind speeds. Based on 116 case studies, differences of 1-2 C exist between the surface and the upper meter of the ocean when wind speeds are less than 5 m/s. Author

**DEDUCTION OF VERTICAL MOTION IN THE ATMOSPHERE FROM AIRCRAFT MEASUREMENTS**
F. J. KOPP (South Dakota School of Mines and Technology, Rapid City) Journal of Atmospheric and Oceanic Technology (ISSN 0739-0572), vol. 2, Dec. 1985, p. 684-688. refs
(Contract NSF ATM-80-25598; NSF ATM-83-11145)

Equations for deducing the vertical motion of air based on aircraft measurements are presented along with derivations. The equations are based on the aircraft equations of motion, but due to different assumptions, the resulting equations are quite different. The equations are then applied to the same aircraft data for comparison. Considerably different results are obtained. The equation based on Lenschow's work is believed to give the most reliable results. Author

**PROGRESS IN THE ANALYSIS OF ATMOSPHERIC TURBULENCE [PROGRES DANS LA CONNAISSANCE DE LA TURBULENCE ATMOSPHERIQUE]**
G. COUPRY (ONERA, Chatillon-sous-Bagneux, France) (NATO, AGARD, Meeting, 61st, Oberammergau, West Germany, Sept. 8-13, 1985) ONERA, TP, no. 1985-164, 1985, 22 p. In French. refs
(ONERA, TP NO. 1985-164)

The report deals with measurement of time histories of turbulence, made by specially equipped aircraft, as well as with statistics of events deduced from a large number of commercial flights. A critical analysis of the methods used to reduce the flight data is developed, and proposals for improvements are suggested. It is shown that patches of turbulence for which a given level is exceeded are distributed following a Poisson distribution. Author

**DYNAMIC RESPONSE OF WINDTURBINE TO YAWED WIND**
A. AZUMA, S. SAITO (Tokyo, University, Japan), and F. NAKAMURA (Toyota Motor Corp., Aichi, Japan) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 18 p.

Dynamic response of a two-bladed windturbine to yawed wind is analyzed by means of the local circulation method. The dynamic system is considered to consist of blade deformation, rotor rotational motion and yawing motion of the windturbine. The amplitude of the 2-P vibration in the bending moment and the rotor torque are more significant in the change of wind direction than in that of wind speed. The exemplified windturbine can follow the change of wind direction with fairly small response time. The inertial forces and moments are much smaller than the aerodynamic components because of the high rigidity of the present rotor. Author

**NUCLEATION OF ICE CRYSTALS IN SUPERCOOLED CLOUDS CAUSED BY PASSAGE OF AN AIRPLANE**
B. VONNEGUT (New York, State University, Albany) Journal of Climate and Applied Meteorology (ISSN 0733-3021), vol. 25, Jan. 1986, p. 98. refs
(Contract NSF ATM-79-21080; N00014-80-C-0312)

The proposed hypothesis of Vonnegut (1948) and Ludlum (1958) which states that cooling produced by adiabatic expansion of air disturbed by an aircraft causes an increase in ice crystal concentrations is examined. Temperature changes in the vortices produced at the tips of wings or propeller blades are estimated; an increase in the rate of crystal production after an increase in the tip speed of the propeller should be detected if aerodynamic cooling causes nucleation of ice crystals. The effects of aerodynamic characteristics of the blades and the blade angle of attack on temperature changes are investigated. I.F.

**DESIGN METHOD FOR THE CALCULATION OF PERFORMANCES AND FLAP MOVEMENT OF FLEXIBLE WIND TURBINE BLADES [ONTWERPMETHODE VOOR DE BEREKENING VAN PRESTATIES EN KLAPBEWEGING VAN FLEXIBELE WINDTURBINEBLADEN]**
T. VANHOLTEN and J. L. KOOMAN Feb. 1983 42 p refs
In DUTCH
(VTH-M-453) Avail: NTIS HC A03/MF A01

Performances, flap movements and loads of so-called flexible wind turbine blade were calculated in cases of right flow, flow with a velocity gradient, and oblique flow. The helicopter rotor based calculation method is simplified, and proves useful for first design estimates. The blades are schematized into intransformable blades attached to the hub using hinges with a spring stiffness such that the rotating natural frequency of the model blade flap movement is equal to the real blade natural frequency.

This document provides definition of the atmospheric electricity threat environment as part of the Atmospheric Electricity Hazards Protection (AEHP) program. This issue contains an initial atmospheric electricity threat to be used for aircraft based on measurement of: (1) the lightning threat at the ground, and (2) the static electrification threat at altitude. The experimental basis for this threat is critically reviewed. Recommendations are made for future work in atmospheric electricity environments to refine and improve understanding of aircraft AEH environments. GRA

**MICROBURST WIND SHEAR MODELS FROM THE JOINT AIRPORT WEATHER STUDIES (JAWS) Final Report**
W. FROST, H. P. CHANG, K. L. ELMORE, and J. MCCARTHY Jun. 1985 198 p
(Contract DTFA01-82-Y-10513)
(AD-A159758; DOT/FAA/PM-85/18) Avail: NTIS HC A09/MF A01 CSCL 04B

Multiple Doppler radar data collected during the Joint Airport Weather Studies (JAWS) Project is used to synthesize the three-dimensional wind in the region of a microburst. A six-degree-of-freedom numerical aircraft model having characteristics similar to Boeing 727 series aircraft is used to investigate jet transport aircraft response to microburst winds during simulated approaches and departures. Simple pilot control laws are used to adjust thrust, pitch, roll, and yaw so as to maintain given approach or departure parameters. Generally, when horizontal wind shear along the approach or departure path is .0001/s or greater, the model is unable to maintain the desired approach path and suffers a significant reduction in climb performance during a go-around or departure. Although the mean wind shear along a path gives a good qualitative measure of the wind shear threat to a jet transport, different paths with similar mean shears can yield markedly different results, as do the same paths with similar mean shears can yield markedly different results, as do the same paths through the microburst at different times, emphasizing the fine temporal and spatial scale of microburst winds. Finally, during the approximate 30 s period required for the aircraft to traverse the region of highest horizontal shear, time variations in the microburst wind field are shown to insignificantly affect the modelled flight path because the traverse period is a short time compared to the life time of a microburst. GRA

(AD-A160375; AFGL-TR-85-0100; AFGL-ERP-914) Avail: NTIS HC A03/MF A01 CSCL 04B

This report summarizes work done as part of the aircraft icing probabilities program. It contains a look at icing in layer-type clouds, a comparison of Particle Measuring System (PMS)2-D data from two flights. and a look at additional data obtained from researchers in the Federal Republic of Germany. The parameters measured in a warm and cold layer-type cloud near Peoria, IL are analyzed and compared. Liquid water content (LWC), cloud depth, particle diameter and particle concentration are compared. Variations of these parameters are compared. In mature clouds, where droplet sizes are approximately equal, the LWC is directly related to the number concentration. The icing rate, LWC and droplet size all increase as a function of height above cloud base. Synoptic patterns and PMS 2-D data obtained on two flights are compared. The first flight, made near Greensboro, NC was in an area of heavy precipitation. The large particles present produced very little icing. The other flight, near Flint, MI was in an area which was experiencing only spotty precipitation. The aircraft, however, experienced moderate icing. Data gathered on aircraft observations in the Federal Republic of Germany are examined. The data show that in strong icing situations, there are many particles with diameters of 10 to 20 microns. The results match those obtained by our research flights. GRA

(AD-A160380; AFGL-TR-85-0049; AFGL-ERP-909) Avail: NTIS HC A04/MF A01 CSCL 04B

A limited set of radar and aircraft data acquired during the 1981 and 1982 Joint Agency Turbulence Experiment are used to compare incoherent and coherent radar methods for atmospheric turbulence severity estimation. Time series of ground-based radar in-phase and quadrature signal return data are processed by Doppler (Fast Fourier Tranform) and incoherent (R-meter with and without noise correction) methods to determine Doppler spectrum variance. These variance data serve as input to a turbulence algorithm to derive estimates of turbulence severity. These estimates are then compared with in-situ aircraft measurements. Results show the order of preference for the radar methods is Doppler, R-meter with noise correction, and R-meter without noise correction. The R-meter without noise correction method must be considered unreliable since it results in large overestimates of turbulence severity when the signal to noise ratio is less than about 12 dB. The R-meter with noise correction method generally duplicates well the results derived from Doppler analysis and may be considered a reasonable alternative when Doppler capability is not available. GRA

**JOINT AGENCY TURBULENCE EXPERIMENT Final Report, 1 Oct. 1981 - 30 Sep. 1984**
A. R. BOHNE 21 Jan. 1985 218 p
(Contract AF PROJ. 6670)
(AD-A160420; AFGL-TR-85-0012; AFGL-ERP-905) Avail: NTIS HC A10/MF A01 CSCL 17I

Doppler radar and aircraft data acquired during the 1981 and 1982 observation seasons are discussed. Time histories of Doppler radar mean velocity and spectrum variance data acquired while tracking an instrumented aircraft during 34 thunderstorm penetrations are presented. Time histories and analysis of turbulence severity, as determined from these radar and aircraft data, are also presented. Whereas use of radar mean velocity in structure function analysis results in underestimation of the actual turbulence severity, radar methods based upon Doppler spectrum variance successfully detect regions of turbulence hazardous to aircraft. The variance-based method, employing a modeled turbulence energy spectrum with a maximum finite eddy size, is found most effective when the turbulence outer scale lies in the range of 1 to 4 km. Classification of turbulence severity as light, moderate, heavy, or severe with a single outer scale value was unreliable. However, classification into composite severity classes, where a composite class combined two or more individual severity classes, was found to be a successful approach for locating hazardous and nonhazardous turbulence regions. Data also show Doppler spectrum variance to be poorly correlated with shear of the radial wind. This shear, resulting from nonturbulence storm structure generally contributed less than 10% of the turbulence contribution to Doppler spectrum variance and could generally be neglected when estimating turbulence severity. GRA

**CALCULATION OF ICE ACCRETION ON CYLINDRICAL RODS ACCORDING TO BAIN'S MODEL, AND COMPARISON WITH EXPERIMENTAL RESULTS**
W. FUCHS (Geophysikalische Beratungsstelle Roth, West Germany), K. P. SCHICKEL, J. KALUZA (Geophysikalische Beratungsstelle, Cochem, West Germany), and K. UWIRA (Bundesamt fuer Wehrtechnik und Beschaffung, Landsberg/Lech, West Germany) Jul. 1985 81 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-970)
(DFVLR-FB-85-46; ISSN-0171-1342) Avail: NTIS HC A05/MF A01; DFVLR, Cologne DM 25.50

Bain's model for the calculation of ice accretion rates was compared with meteorological flight data. The Bain model for the determination of the ice accretion rate on cylindrical rods is extended to the calculation of the accretion shape and velocity in pure water clouds. Ice accretion is measured on an aircraft during flights in stratus clouds. By taking into account the energy balance estimate of Ludlam for the calculation of an upper bound on the spontaneously freezing supercooled liquid water content (LWC), good agreement between the calculated and measured ice accretion is obtained. The effect of higher LWC's on the ice accretion is not proportional, as theory shows. Author (ESA)

**WIND SHEAR INVESTIGATION PROGRAM AT THE NLR**
H. HAVERDINGS 23 Mar. 1984 52 p refs In DUTCH; ENGLISH summary Presented at Aeronautical Symposium, Delft, Netherlands, 13 Apr. 1984
(NLR-MP-84027-U; B8571447) Avail: NTIS HC A04/MF A01

Wind shear statistics were collected from wide-body aircraft equipped with an airborne integrated data acquisition system during 9000 approaches and landings. In the resulting time dependent wind profiles, wind shear occurrences were analyzed, using a statistical discrete gust method. Flight simulation studies of F-28 aircraft landings for 8 wind profiles with different wind shear types were performed to evaluate 2 wind shear detectors. During the simulation, effort ratings of three pilots for air speed control and tracking the glide path were established. The indication of flight energy deviation is preferred above indication of this magnitude expressed in change of time. Ground and on-board indicators, including apparatus using predictive remote sensing techniques were surveyed. Author (ESA)

**CONCEPT FLYING - A METHOD FOR DERIVING UNIQUE SYSTEM REQUIREMENTS**
J. C. SIMONS and S. B. HOTTMAN (Systems Research Laboratories, Inc., Dayton, OH) IN: Human Factors Society, Annual Meeting, 28th, San Antonio, TX, October 22-26, 1984, Proceedings. Volume 2 . Santa Monica, CA, Human Factors Society, 1984, p. 825-828. refs

Simons (1974) discussed an approach to achieving concept breakthroughs by inserting intuitive researchers in loosely structured, scaled-down situations. The approach involves the observation of the pilot when he is interacting in a loosely constrained operational environment. The considered approach, called 'concept flying', represents a technique for the development of new systems designs. Today the main shortfall of concept flying techniques is that they are seldom used. The present paper provides successful concept-flight programs, and new proposals for using concept flying in a study of concepts which are beyond the capabilities of current aircraft. G.R.

**NOISE LEVELS IN COCKPITS OF AIRCRAFT DURING NORMAL CRUISE AND CONSIDERATIONS OF AUDITORY RISK**
D. C. GASAWAY (Cabot Corp., E-A-R Div., Indianapolis, IN) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 57, Feb. 1986, p. 103-112. refs

Noise data, including A-levels and C-minus-A values, are summarized for exposures associated with normal cruise flight in 13 groups of 593 aircraft; means and standard deviations are reported; degrees of auditory risk using OSHA-1983 criterion are presented; and at-the-ear protected and unprotected exposures are revealed. Mean A-levels were 95.0 for 528 fixed-wing; 100.9 for 65 rotary-wing; and 95.7 for all 593 aircraft. Of 13 subgroups, the lowest mean A-level (85.5) was exhibited in the cockpits of tail-mounted turbojet/fan-powered aircraft, and the highest (105.0) was found in both reciprocating and turbine-powered twin-rotor helicopters. All means A-levels exceeded the OSHA damage-risk criterion for 8 h/d exposures. At-the-ear exposures while wearing hearing protection are presented. Results clearly illustrate the potential for auditory damage of unprotected aircrews. Hearing protection must be considered to effectively control routinely encountered exposures. The material and illustrations resulting from this study will help health and safety monitors during indoctrination and counseling of aircrews concerning the need to protect their hearing against noise exposures during normal and routine flight operations. Author

**EFFECT OF SEAT CUSHIONS OF HUMAN RESPONE TO +GZ IMPACT**
B. F. HEARON and J. W. BRINKLEY (USAF, Aerospace Medical Research Laboratories, Wright-Patterson AFB, OH) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 57, Feb. 1986, p. 113-121. refs
(Contract F33615-83-C-0500)

Several ejection seat cushions are evaluated based on human response to vertical impact acceleration. The cushions consist of: (1) one layer of 5.1 cm thick low-density conventional polyurethane foam and a second layer of 1.3 cm thick high-density plastic foam (F-111 cushion); (2) a layer of 1 cm thick sheet foam polyethylene, 1.3 cm Temper foam, and 0.6 cm thick space fabric (ACES II cushions); and (3) 5.1 cm thick rate-dependent slow-recovery polyurethane foam. Vertical impact tests were performed on 25 subjects of 26.1 + or - 3.4 years, weighing 79.1 + or - 9.0 kg, and 178 + or - 7.1 cm tall; the test conditions and equipment are described. The carriage acceleration and velocity, seat loads, and head and chest acceleration are measured and compared. The data reveal that the F-111 and ACES II cushions have higher seat loads and head and chest accelerations than the rate-dependent polyurethane foam cushions; it is concluded that the rate-dependent cushions provided greater impact protection than current operational cushions. I.F.

**FLIGHT DECK AUTOMATION DECISIONS**
E. F. WEENER (Boeing Commercial Airplane Co., Seattle, WA) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 3-8. refs
(SAE PAPER 841471)

Effective man-machine interface design for an airplane flight deck depends strongly on providing apppropriate levels of control capability for use by the flight crew. The range of control options available to the airplane system designer extends from manual through partially automatic to full automatic. Selection of appropriate types and levels of automation for each new airplane is a complex task. It involves understanding the capabilities and limitations of the human operator, airplane operational and functional considerations, as well as concerns for cost and available technology. Recent airplanes have demonstrated the practicality of providing different levels of automation which can be applied by the flight crew under different circumstances. This trend expands the options available to the flight crew in coping with the changing operational environment. It also allows the flight crew to participate directly in the choice of when and how to apply automation. This paper describes the various automation factors which are considered in the process of developing a design. Author

**FLIGHT DECK DESIGN METHODOLOGY USING COMPUTERIZED ANTHROPOMETRIC MODELS**
G. STONE and H. MCCAULEY (Douglas Aircraft Co., Long Beach, CA) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 9-16. refs
(SAE PAPER 841472)

A new 'inside out' flight deck design methodology has been developed, in which the flight crew member is the logical starting point. Several computer models that simulate varying pilot sizes, proportions, reach, and vision capabilities are created and utilized to generate the required 'envelopes' of vision, reach, and motion for the entire range of the pilot population. These envelopes are then employed to define the internal geometric relationships of the flight deck and its components. The methodology is described, including discussions of the aspects of defining the user population, generation of crew sample, creating a three-dimensional operator model, determining functional envelopes, and component integration. Design diagrams are included. I.S.

### AI APPLICATIONS TO MILITARY PILOT DECISION AIDING - A PERSPECTIVE ON TRANSITION

W. G. JAMES (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 19-24.
(SAE PAPER 841533)

The process of transition of the Pilot Decision Aiding AI technology to operational application is discussed in the framework of various R&D programs. The experience of implementing the 'intent-driven' cockpit technology in a Coast Guard helicopter and in simulation and flight test programs is described. A priority list of the subsystems and activities sufficiently mature for early automation and decision aiding is given, and the three consecutive steps to be taken for the transition ('Imitate', 'Embellish', and 'Fully Exploit') are explained. The importance of an airborne development program that precedes the flight evaluation program is emphasized. I.S.

### AUTOMATION IN THE COCKPIT - WHO'S IN CHARGE?

R. W. MOSS, J. M. REISING, and N. R. HUDSON (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 25-29. refs
(SAE PAPER 841534)

This paper discusses levels of automation and decision making and arrives at an overall design philosophy for allocating tasks to the pilot and the computer. In order to produce a levels of automation matrix three categories of pilot-computer interface (pilot only, blended, and computer only) and three types of goals, (mission, functional and task), are identified. These two dimensions are then used to create a matrix which can be employed as a means of comparing automated systems. The options that the matrix produces are discussed and examples given. The overall design philosophy is to have the mission goals accomplished in a blended manner with both the pilot and computer contributing. Lower level goals are handled exclusively by the computer. The reasoning for this philosophy is to allow the pilot to operate in a rule-based environment so that he can optimally cope with the greatly increased amounts of information he will face in future missions. ### EFFECT OF VIBRATION ON THE READABILITY OF COLOR CRT DISPLAYS

L. IVEY (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 53-59. refs
(SAE PAPER 841466)

The readability of symbols on a color CRT display in a vibrational environment equivalent to low-level flights was rated by eight aircraft personnel subjects undergoing tests in a Sixmode motion simulator. The differences in the values of the chrominance and luminance between static and vibrational conditions were determined. In addition, the impact of wearing protective PLZT goggles was evaluated. The comfortable viewing zone for the normal (non-PLZT) case was between 2.5 and 6.5 Hz, whereas the zone with PLZT was between 3 and 6.5 Hz. The colors and symbol changes caused by the applied vibration were acceptable, indicating the stability of the Sperry CRT shadow mask. The legibility data indicate that in a vibration environment, a minimum symbol size of greater than 0.12 in. is necessary. The digital update rate change should be between 3 and 5 Hz for the most comfortable viewing and the least errors. I.S.

### A REVIEW OF PILOT WORKLOAD MEASUREMENT TECHNIQUES USED ON THE A-10 SINGLE SEAT NIGHT ATTACK TEST PROGRAM

C. D. CRITES (USAF, Human Factors Branch, Edwards AFB, CA) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 107-112.
(SAE PAPER 841492)

A three-phase flight test program to evaluate the A-10 Single Seat Night Attack (SSNA) aircraft was conducted at the Air Force Flight Test Center (AFFTC), Edwards AFB, CA. An important objective of the SSNA testing was to assess, and where possible, measure pilot workload. The techniques utilized during the test program to quantify workload were: an objective measurement of task performance, control activity, and physiological status data, and the Subjective Workload Assessment Technique (SWAT). The use of objective techniques represented the first application in a flight test environment and an initial attempt to validate their use as work-load metrics. Both objective and subjective methods were of significant value, but both techniques had limitations and shortfalls. Lessons learned affecting the application of the techniques to on-going and future flight test programs are described. Author

### ADVANCED FIGHTER TECHNOLOGY INTEGRATION (AFTI) F-16 - THE PILOT INTERFACE

D. R. MCMONAGLE (USAF, Flight Test Center, Edwards AFB, CA) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 121-125.
(SAE PAPER 841633)

The aspects of the pilot-vehicle interphase in the two first phases of the Advanced Fighter Technology Integration (AFTI)/F-16 Program, which was designed to develop and demonstrate technologies and alternatives for future fighter aircraft design, are discussed. The results of the first AFTI phase, the Digital Flight Control System, indicated the need for multiple flight control mode capability in future multirole fighter aircraft. The second phase of the Program, the Automated Maneuvering Attack System, which began in July 1984, involves the development and evaluation of improved sensors, integrated fire and flight control for automated maneuvering weapon delivery, and enhancements in pilot-vehicle interface. I.S.

### EFFECTS OF DIGITAL ALTIMETRY ON PILOT WORKLOAD

R. L. HARRIS, SR. (NASA, Langley Research Center, Hampton, VA) and B. J. GLOVER (Kentron International, Inc., Hampton, VA) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 131-136. Previously announced in STAR as N86-13892.
(SAE PAPER 841489)

A series of VOR-DME instrument landing approaches was flown in the DC-9 full-workload simulator to compare pilot performance, scan behavior, and workload when using a computer-drum-pointer altimeter (CDPA) and a digital altimeter (DA). Six pilots executed two sets of instrument landing approaches, with a CDPA on one set and a DA on the other set. Pilot scanning parameters, flight performance, and subjective opinion data were evaluated. It is found that the processes of gathering information from the CDPA and the DA are different. The DA requires a higher mental workload than the CDPA for a VOR-DME type landing approach. Mental processing of altitude information after transitioning back to the attitude indicator is more evident with the DA than with the CDPA. E.A.K.

### WINGING IT IN THE 1980'S - WHY GUIDELINES ARE NEEDED FOR COCKPIT AUTOMATION

M. R. HOAGLAND (Air Line Pilots Association, International, Washington, DC) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 155-162. refs
(SAE PAPER 841634)

There have been many reasons for the introduction of automation into the cockpit of the modern airliner. In some cases the forces driving technology have caused the design of automated systems which compromise the ability of the pilot to fulfill his responsibilities for the safety of the airplane under his command. This paper examines how these forces can lead to unnecessary cockpit automation, and discusses what must be done to avoid the introduction of automated systems which have the effect of removing the human operator from the information and control processes. Author

### SITUATION VERSUS COMMAND

J. G. OLIVER (Air Line Pilots Association, International, Washington, DC) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 163-165.
(SAE PAPER 841638)

Two types of flight information are provided to pilots, situational and command. Situation information tells the pilot the state of the aircraft and its flight path while command information tells the pilot what to do and is not related to any given situation. This paper discusses why it is extremely important for the pilot to be provided with appropriate and adequate situation information in all aircraft but especially in modern highly-automated aircraft. Author

### THE DECISION TO FLY

A. F. ZELLER IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 169-176.
(SAE PAPER 841613)

The decision to fly and the capacity to carry a flight to a successful termination involves a wide spectrum of background determinants. These range from considerations of the pilot as a physical being with specific potentials and limitations of body structure, mental ability and emotional capacities to the adequacy of learning related to a specific performance and the character and condition of the aircraft. Specific factors relevant to each of these categories is discussed including the psycho-social, physiological and pathological. Crucial to success is the pilot's self-critical judgement. There is a necessary tension between the ongoing activity of carrying out a positive decision to fly and the requirements for continual assessment of the situation. Author

### U.S. ARMY HELICOPTER VOICE TECHNOLOGY APPLICATIONS

F. J. MALKIN (U.S. Army, Human Engineering Laboratory, Aberdeen Proving Ground, MD) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 207-211. refs
(SAE PAPER 841609)

Voice technology provides a potential for alleviating the extremely high visual and manual workload of Army helicopter pilots. Before voice technology can be successfully employed in the cockpit, there are many human factors issues that must be resolved. This paper describes the approach used to identify potential applications of voice technology in an Army helicopter and the emulation of a voice interactive Doppler navigation set. Author

### COMPARISON OF VOICE TYPES FOR HELICOPTER VOICE WARNING SYSTEMS

C. A. SIMPSON, K. MARCHIONDA-FROST, and T. NAVARRO (Psycho-Linguistic Research Associates, Menlo Park, CA) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 217-224. Army-supported research. refs
(Contract NAS2-11341)
(SAE PAPER 841611)

Three related studies were conducted to compare different types of human voice warnings. In the first study, a comparison of three LPC-encoded voices, human female, human male, and phoneme-synthesized, by the criteria of pilot flight task performance showed no differences due to the voice type. In the second study, pilots' preferences were investigated, by comparing preference for direct synthesized speech to the LPC-encoded human female speech and to LPC-encoded synthesized speech. Most pilots were found to prefer direct synthesized speech over both LPC-encoded human female speech and the LPC-encoded synthesized speech. In the third study, phonetically balanced (PB) words heard in simulated helicopter noise were used to compare the intelligibility of direct synthesized and LPC-encoded phoneme-synthesized speech types. PB word intelligibility was found to be better for direct synthesized speech than for the LPC-encodes synthesized speech. I.S.

### ADVANCED TECHNOLOGY - NEW FIXES OR NEW PROBLEMS?

C. A. SIMPSON (Psycho-Linguistic Research Associates, Menlo Park, CA) IN: Aerospace Behavioral Engineering Technology Conference, 3rd, Long Beach, CA, October 15-18, 1984, Proceedings . Warrendale, PA, Society of Automotive Engineers, Inc., 1984, p. 225-236. refs

The principles of application of voice technology to cockpit control and display systems, the advantages of its use and the pitfalls of its misuse or overuse are discussed. The omnidirectionality and the sequential nature of speech imply the general requirements of short sentences, the minimal number of multiple messages, and avoidance of concurrent messages in the use of voice for both display and command purposes. To be of an advantage to the pilot, the use of voice displays must be limited to time-critical flight information, and the use of voice control must be limited to time-critical operations, both at the time when the pilot is visually or manually occupied to the extent that the voice display/command will reduce his workload. Especially important will be an integrated design of all voice controls and displays in order to avoid overloading the pilot with multiple messages and required control inputs, in a transmission mode that is essentially a single-channel system. I.S.

B. J. FISTER (General Electric Co., Aircraft Engine Business Group, Cincinnati, OH) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 12-1 to 12-10.

The development of a modern and effective data acquisition and processing system for flight testing commercial aircraft engines is discussed. The specifications and required accuracy of the system are presented, and the various aspects of the data acquisition system are examined, including the input, block design, block temperature determination, analog multiplexer, pressure system, calibration, transducers, frequency measurement, and output. A system block description is given, and the ground station and calibration are described. The system's two main operating modes for acquiring data, a steady state mode and a transient mode, are addressed. The software data flow is shown and described, and present operating experience is reported. C.D.

**A STUDY OF STATE OF THE ART COMPUTER GRAPHICS SYSTEMS FOR FLIGHT SAFETY MONITORING**
D. J. MALONE (Computer Sciences Corp., Systems Div., Lompoc, CA) and M. SHRADER-FRECHETTE (Florida, University, Gainesville) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 13-1 to 13-14. refs

The state of the art in high-speeds, high-resolution, computer-driven, color-graphic display systems suitable for the growth of a currently in-place but obsolescent systems is studied. Potential deficiencies of present systems in the areas of quality of the display image and saturation of the host or display processors are discussed. Currently available graphic display system technologies are examined, including display screen technologies, display controllers, and graphics processors. Needed display features are determined, readily available components which have the required features are identified, and recent technological advances are extrapolated in order to identify future developments. J. S. HAWKINS, J. M. REISING, B. K. WOODSON (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH), and S. J. BERTLING (U.S. Air Force Academy, Colorado Springs, CO) IN: Human Factors Society, Annual Meeting, 28th, San Antonio, TX, October 22-26, 1984, Proceedings. Volume 1 . Santa Monica, CA, Human Factors Society, 1984, p. 118-122. refs

A multifunction switch is one way to solve the diminishing real estate problem in the modern cockpit. This study looked at pictorial coding of such a switch. Twelve different symbols were used, each with three levels of complexity and two levels of polarity. An error rate count was taken for subjects under both a naive and learned 50 millisecond exposure condition. This study demonstrated that there were three classes of symbols. These were: intuitive to the naive subject, intuitive to a learned subject, and nonintuitive, even to a learned subject. Complexity levels had a significant effect in only three of the twelve symbols. Polarity differences also had a significant effect in only three of the twelve symbols, although they were a different three. The overall conclusion is that the majority of symbols were intuitive after learning and robust to changes in complexity and polarity. Author

**AUTOMATION EFFECTS IN A MULTILOOP MANUAL CONTROL SYSTEM**
R. A. HESS and B. D. MCNALLY (California, University, Davis) IEEE Transactions on Systems, Man, and Cybernetics (ISSN 0018-9472), vol. SMC-16, Jan.-Feb. 1986, p. 111-121. refs
(Contract NAG2-221)

An experimental and analytical study was undertaken to investigate human interaction with a simple multiloop manual control system in which the human's activity was systematically varied by changing the level of automation. The system simulated was the longitudinal dynamics of a hovering helicopter. The automation-systems-stabilized vehicle responses from attitude to velocity to position and also provided for display automation in the form of a flight director. The control-loop structure resulting from the task definition can be considered a simple stereotype of a hierarchical control system. The experimental study was complemented by an analytical modeling effort which utilized simple crossover models of the human operator. It was shown that such models can be extended to the description of multiloop tasks involving preview and precognitive human operator behavior. The existence of time optimal manual control behavior was established for these tasks and the role which internal models may play in establishing human-machine performance was discussed. Author

**THE DEVELOPMENT AND APPLICATION OF FINITE ELEMENT STRESS ANALYSIS TECHNIQUES AT WESTLAND HELICOPTERS LTD**
M. L. W. SALZER and P. C. WOOD (Westland, PLC, Helicopter and Hovercraft Group, Yeovil, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 22 p.

This paper discusses the role of the finite element method in the design-development cycle. No attempt is made to give a theoretical background but rather to outline the technique, method of implementation and areas of application. In particular the pre- and post-processing software package WISDOM is examined and the steps involved in performing a finite element statics analysis. It is envisaged that with more powerful computers and the acceptance of CAD solid modelling in design, that the time required to perform a finite element analysis will be reduced even further. Some of the improvements that are required to achieve this time reduction are also discussed. Author

**DEVELOPMENT TESTING OF INTEGRATED AVIONICS SYSTEMS USING DYNAMIC ENVIRONMENT SIMULATION**
P. L. SHILLITO (Westland Helicopters, Ltd., Yeovil, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 21 p. refs

The evolution of sophisticated integrated avionics packages and their incorporation into civil and military helicopters has caused and will continue to cause significant perturbations to avionics and airframe manufacturers' integration plans. A coherent testing philosophy is discussed which co-ordinates avionic system design with its supporting development and validation tools. Highlighted is the use of inherent system performance data to maintain, system integrity during validation of the developed system core whilst permitting full test automation. Facilities developed for dynamic simulation and performance assessment and presentation are described. These techniques are shown to reduce costs, improve effectiveness, and provide a high demonstrable level of confidence in the resultant integrated system. Author

**PARTITIONING AND PACKING MATHEMATICAL SIMULATION MODELS FOR CALCULATION ON PARALLEL COMPUTERS**
D. J. ARPASI and E. J. MILNER 1986 38 p refs Prepared for Presentation at the 1986 International Conference on Parallel Processing, St. Charles, Ill., 19-22 Aug. 1986; sponsored by Pennsylvania State Univ. and IEEE Computer Society
(NASA-TM-87170; E-2808; NAS 1.15:87170) Avail: NTIS HC A03/MF A01 CSCL 09B

The development of multiprocessor simulations from a serial set of ordinary differential equations describing a physical system is described. Degrees of parallelism (i.e., coupling between the equations) and their impact on parallel processing are discussed. The problem of identifying computational parallelism within sets of closely coupled equations that require the exchange of current values of variables is described. A technique is presented for identifying this parallelism and for partitioning the equations for parallel solution on a multiprocessor. An algorithm which packs the equations into a minimum number of processors is also described. The results of the packing algorithm when applied to a turbojet engine model are presented in terms of processor utilization. Author

An Expert System contains a knowledge base, an inference engine, an explanation system, a model of the real world and a man machine interface. The types of reasoning include interpretation, monitoring, prediction and design, together with specializations of these, such as diagnosis and planning, and aggregations, such as debugging, instruction and control. A range of possible applications are described to illustrate these general tasks. The nature of the knowledge available, and some implementation problems, are identified. The applications include examples in the area of tactical decision aids, specifically sensor data interpretation, data fusion, threat assessment and resource allocation. Other topics include cockpit environments and intelligent tutoring. Finally, some of the problems that limit the immediate widespread adoption of the technology are discussed. Author

This program evaluates the success of a pattern recognition system which attempts to recognize an object even though the object differs in size and orientation from the object used as a reference. The criteria for recognition were the peak value and shape of the cross correlation function calculated in two dimensions. The cross correlation was performed using Fourier transform techniques to judge the utility of implementing the system using many standards optical components. Size, or scale, invariance was achieved using a logarithmic sampling technique (the Mellin transform), and variations on traditional sampling methods were shown to extend the scale invariance predicted by various researchers. The utility of the sampling techniques developed was proven using images acquired from infrared sensors carried aboard helicopters. Limits of practical scale invariance were explored and system design approaches were suggested from the results of numerical experiments carried out in computer simulations. GRA

Sufficient conditions are obtained for the sign-determinacy of a sum of polylinear forms. These sums are used to form Liapunov functions which are employed to derive sufficient conditions for the asymptotic stability in the whole of the unperturbed motion of nonlinear systems. The perturbed motions are described by a set of ordinary differential equations with a right part in the form of a sum of homogeneous polynomials. The proposed approach is applied to the analysis of the longitudinal stability of an aircraft with allowance for the nonlinearity of the aerodynamic coefficients and nonlinear relations between the angle of attack and the pitch angle. N. M. PISAREV, IU. P. STAVROV, and V. I. TAMBOVTSEV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 3, 1985, p. 99, 100. In Russian.

The effect of longitudinal potential distribution in stationary jets of an ionized gas, such as those produced by jet aircraft, is investigated experimentally for the case where a jet of an ionized gas issues from an axisymmetric conical nozzle into a space flooded with a neutral gas. An expression is obtained for the longitudinal potential distribution for the main section of a jet relative to its source for quasi-neutral conditions. The validity of the expression is verified experimentally for a jet engine with a thrust of 230 N and a discharge velocity of 1800 m/s. V.L.

**RESEARCH ON SONIC INLET**
R. SASAKI, Y. KOHAYAGAWA, K. HIRAOKA, and T. WATANABE Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 378, 1985, p. 420-432. In Japanese, with abstract in English.

In recent aircraft with high by-pass ratio engines, the major noise source is the forward propagating fan noise from the engine inlet. Reported here is the investigation of the sonic inlet, which drastically reduces the abovementioned forward propagating fan noise. Model sonic inlets of both contracting wall type and translating centerbody type were designed by a newly developed analytical method based on flux analysis, and tested aerodynamically and acoustically. Criteria for boundary layer separation, total pressure recovery characteristics, and crosswind characteristics of a sonic inlet were obtained, and a model sonic inlet of the contracting wall type showed 21 PNdB noise reduction in model engine noise tests. Comparison between the analytical and experimental results proved the usefulness of the newly developed design method. Author

**HIGH VELOCITY GAS JET NOISE CONTROL Abstract Only**
A. DAY 1985 3 p
Avail: Issuing Activity

The physics of jet noise generation, and some of the principal applications and methods of jet noise control are described. Jet noise generation due to the nozzle size, discharge velocity, gas density, jet shape, etc., is well documented by scientific literature, complete with mathematical formulae for noise level prediction. Worked examples are provided. G.L.C.

The noise generated by supersonic tip speed propellers may be a cabin environment problem for future propeller-driven airplanes. Active suppression from speakers inside the airplane cabin has been proposed for canceling out this noise. The potential of active suppression of advanced turboprop noise was tested by using speakers in a rectangular duct. Experiments were first performed with sine wave signals. The results compared well with the ideal cancellation curve of noise as a function of phase angle. Recorded noise signals from subsonic and supersonic tip speed propellers were than used in the duct to deterthe potential for canceling their noise. The subsonic propeller data showed significant cancellations but less than those obtained with the sine wave. The blade-passing-tone cancellation curve for the supersonic propeller was very similar to the subsonic curve, indicating that it is potentially just as easy to cancel supersonic as subsonic propeller blade-passing-tone noise. Propeller duct data from a recorded propeller source and spatial data taken on a propeller-drive airplane showed generally good agreement when compared versus phase angle. This agreement, combined with the similarity of the subsonic and supersonic duct propeller data, indicates that the area of cancellation for advanced supersonic propellers will be similar to that measured on the airplane. Since the area of cancellation on the airplane was small, a method for improving the active noise suppression by using outside speakers is discussed. Author

This document presents acoustical data and flight path information acquired during the FAA/HAI Helicopter Flight

Operations Noise Test Program. As-measured noise levels of the Aerospatiale 365N, Agusta 109A, Bell 206L-1 and 222A, Hughes 500D, MBB BK117, Robinson R22, and Sikorsky S76 are presented for various enroute and heliport flight operations. These operations include level flyovers at two altitudes, normal takeoffs, normal and constant-glideslope approaches, various types of noise abatement approaches, level flight turns and hover (IGE and OGE). The acoustical data are accompanied by radar tracking data and cockpit instrument panel information which document the operational procedures flown, and meteorological measurements to permit data corrections for nonstandard atmospheric conditions. This helicopter operational noise data base can be used in enroute and heliport land use planning, heliport environmental studies and planning guidelines, pilot familiarization and training, verification of noise prediction and estimating methods, and lateral attenuation studies. **DISTRIBUTED SENSOR NETWORKS Semiannual Technical Summary Report, 1 Oct. 1984 - 31 Mar. 1985**
R. T. LACOSS 26 Sep. 1985 32 p
(Contract F19628-85-C-0002; ARPA ORDER 3345; AF PROJ. 5D30; AF PROJ. 5T10)
(AD-A160596; ESD-TR-85237) Avail: NTIS HC A03/MF A01 CSCL 17B

The Distributed Sensor Networks (DSN) program is aimed at developing and extending target surveillance and tracking technology in systems that employ multiple spatially distributed sensors and processing resources. Such a system would be made up of sensors, data bases, and processors distributed throughout an area and interconnected by an appropriate digital data communication system. The detection, tracking, and classification of low flying aircraft has been selected to develop and evaluate DSN concepts in the light of a specific system problem. A DSN test bed has been developed and is being used to test and demonstrate DSN techniques and technology. The overall concept calls for a mix of sensor types. The initial test-bed sensors are small arrays of microphones at each node augmented by TV sensors at some nodes. This Semiannual Technical Summary (SATS) reports results for the period 1 October 1984 through 31 March 1985. Progress in the development of distributed tracking algorithms and their implementation in the DSN test-bed system is reviewed in Section II. Test-bed versions of distributed acoustic tracking algorithms now have been implemented and tested using simulated acoustic data. This required developing a solution to a basic distributed tracking problem: the information feedback problem. Target tracks received by one node from another node often implicitly include information that originally was obtained from the receiving node. GRA

The noise level of a Cessna F 172L in stationary symmetric horizontal engine flight at 1000 feet height was measured 14 times using 2 microphones placed above a white-sprayed aluminum plate and 1.2 m height above grassland, both horizontally directed to the arriving airplane. The measurements were carried out to determine the variation in noise certification measurements, and to verify a model for the determination of ground impact. The A-weighted noise spectra levels of the plane in overhead position are measured and averaged after flight height deviation corrections. Author (ESA)

**ACOUSTIC GUIDE FOR NOISE TRANSMISSION TESTING OF AIRCRAFT Patent Application**
R. VAICAITIS, inventor (to NASA) (Columbia Univ., N.Y., N.Y.) 3 Jul. 1985 13 p Sponsored by NASA
(NASA-CASE-LAR-13111-1-CU; NAS 1.71:LAR-13111-1-CU; US-PATENT-APPL-SN-751695) Avail: NTIS HC A02/MF A01 CSCL 20A

Selective testing of aircraft or other vehicular components without requiring disassembly of the vehicle or components was accomplished by using a portable guide apparatus. The device consists of a broadband noise source, a guide to direct the acoustic energy, soft sealing insulation to seal the guide to the noise source and to the vehicle component, and noise measurement microphones, both outside the vehicle at the acoustic guide output and inside the vehicle to receive attenuated sound. By directing acoustic energy only to selected components of a vehicle via the acoustic guide, it is possible to test a specific component, such as a door or window, without picking up extraneous noise which which may be transmitted to the vehicle interior through other components or structure. This effect is achieved because no acoustic energy strikes the vehicle exterior except at the selected component. Also, since the test component remains attached to the vehicle, component dynamics with vehicle frame are not altered. NASA

**STATUS AND CAPABILITIES OF SONIC BOOM SIMULATORS**
K. P. SHEPHERD and C. A. POWELL Jan. 1986 8 p refs
(NASA-TM-87664; NAS 1.15:87664) Avail: NTIS HC A02/MF A01 CSCL 20A

The current status and capabilities of sonic boom simulators which might be used in future studies of the effects of sonic boom on people, animals, or structures is summarized. The list of candidate simulators is based on a literature search which was confined to the United States and Canada. Some of the simulators are fully operational, others could be made operational with a modest investment, and still others would require a major investment. For the sake of the completeness, some simulators which were the subject of a previous review, but which no longer exist, are also included herein. Author

Four series of flight tests were conducted to measure sound pressure levels inside and outside the cabin of a twin-engined turboprop airplane. Particular emphasis was placed on harmonics of the propeller blade passage frequency. The cabin was unfurnished for the first three flights, when the main objective was to investigate the repeatability of the data. For the fourth flight, the cabin was treated with fiberglass batts. Typically, the exterior sound pressure levels were found to vary 3 to 5 dB for a given harmonic, but variations as high as 8 dB were observed. The variability of harmonic levels within the cabin was slightly higher but depended on control of the relative phase between the propellers; when phase was not controlled the average variability was about 10 dB. Noise reductions provided by the fuselage structure were in the range of 20 to 40 dB, when an exterior microphone in the plane of rotation of the propeller was used as reference. Author

This document reports the findings of the U.S test team's participation in the Helicopter Noise Measurement Repeatibility Program (HNMRP). The U.S./Canadian flight test was held in August of 1984 at Dulles International Airport near Washington, D.C. The principal objective of this international HNMRP is to refine noise certification testing requirements. Participating nations conducted the test programs on the same type helicopter, the Bell 206L-1 (or the acoustically equivalent 206L-3), using the same test procedures. Analyses in this document include the investigation of source noise adjustments based on increases in noise level with advancing blade tip Mach number, the examination of relative source contributions in the helicopter acoustical spectrum, and source directivity for both in-flight and static operations. This report contains helicopter noise definition information (useful in environmental impact analyses) for level flyovers at various airspeeds and altitudes, and ICAO takeoff and approach procedures. Data are also shown for a noise abatement operation involving dynamic changes in torque, rate of descent and airspeed. This report also provides information for the hover-in-ground effect, flight idle and ground idle static operations. GRA

**B-52G CREW NOISE EXPOSURE STUDY**
W. H. DECKER and C. W. NIXON 30 Aug. 1985 49 p
(Contract AF PROJ. 7231)
(AD-A161112; AFAMRL-TR-85-056) Avail: NTIS HC A03/MF A01 CSCL 20A

The B-52G aircraft produces acoustic environments that are potentially hazardous, interfere with voice communications and may degrade task performance. Numerous reports from aircrew of high noise levels at crew location have been documented for those B-52G aircraft that have been modified with the Offensive Avionics System. To alleviate and minimize the excessive noise exposures of aircrews, a study of the noise problem in the b-52G was deemed necessary. First, in-flight noise measurements were obtained at key personnel locations on a B-52G during a typical training mission. Then, extensive laboratory analyses were conducted on these in-flight noise data. The resulting noise exposure data were evaluated in terms of the various segments of and the total flight profile relative to allowable noise exposures. Finally, recommendations were developed for short term and long term approaches toward potential improvement in the B-52G noise exposure problem. Author (GRA)

C. JOHE and J. HAERTIG 26 Jun. 1984 42 p refs In FRENCH
(ISL-R-113/84) Avail: NTIS HC A03/MF A01

An experimental study was carried out to compare the acoustic field of a small turbojet with the field generated by a cold free jet excited or not. With subsonic jets the wide band noise shows a sinus variation associated to the turbine excitation. The azimuth field distribution is similar to that of the free jet. At maximum velocity the supercritical jet shows a far field similar to that of a nonexcited jet. The maximum emission is at a 30 deg angle, corresponding to the Oertel W Mach waves. Author (ESA)

J. R. PRINCE Sep. 1985 77 p
(AD-A161153; AFIT/GSM/LSY/85S-29) Avail: NTIS HC A05/MF A01 CSCL 14B

This thesis sought to determine how in-house research projects are selected at the U.S. Air Force Wright Aeronautical Laboratories (AFWAL). The problem was explored by studying ten aspects of the research project selection process. This analysis was accomplished by using a combination of personal and telephone interviews. Ten individuals from each of the four AFWAL Laboratories were interviewed. The results illustrated that few of the respondents used a formal decision method model when selecting research projects. Most of the in-house projects selected at AFWAL are chosen via a consensus of agreement between the various levels of management in each laboratory. GRA

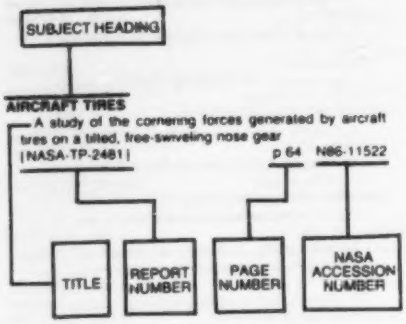
**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 201)* JUNE 1986

### Typical Subject Index Listing



SUBJECT HEADING
AIRCRAFT TIRES
A study of the cornering forces generated by aircraft tires on a tilted, free-swiveling nose gear
[NASA-TP-2481] p 64 N86-11522
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

Loads and aeroelasticity division research and technology accomplishments for FY 1985 and plans for FY 1986 [NASA-TM-87676] p 278 N86-19288

Transonic unsteady aerodynamics and its aeroelastic applications [AGARD-CP-374-ADD-1] p 279 N86-19299

Ground vibration test results for Drones for Aerodynamic and Structural Testing (DAST)/Aeroelastic Research Wing (ARW-1R) aircraft [NASA-TM-85906] p 294 N86-19312

**AERONAUTICAL ENGINEERING**

Aircraft design at Kingston Polytechnic p 333 A86-25090

Research and development project selection methods at the air Force Wright Aeronautical Laboratories [AD-A161153] p 333 N86-20165

**AEROSPACE ENGINEERING**

The viscoelastic damping technology design guide for aerospace structures [ASME PAPER 85-DET-104] p 318 A86-24230

**AEROSPACE SYSTEMS**

Interactive modal imaging process for vibrating structures [ASME PAPER 85-DET-110] p 318 A86-24231

**AFTERBODIES**

Generation of the starting plane flowfield for supersonic flow over a spherically capped body [AD-A161117] p 278 N86-19291

**AH-64 HELICOPTER**

U.S. Army helicopter voice technology applications [SAE PAPER 841609] p 329 A86-26028

**AILERONS**

Effect of sweep angle on static aeroelasticity - Theory for physical meanings p 288 A86-25180

**AIR BREATHING ENGINES**

Aeronautical facilities catalogue. Volume 2: Airbreathing propulsion and flight simulators [NASA-RP-1133] p 311 N86-18328

**AIR CONDITIONING EQUIPMENT**

The new environmental control system for the B-52 G/H aircraft [SAE PAPER 851320] p 285 A86-23510

Modular air shut-off valve [AD-D011935] p 321 N86-18728

**AIR DATA SYSTEMS**

Economical in-flight calibration of air data sensors using inertial navigation units as reference p 284 A86-23270

Flight test evaluation of the Netherlands flight inspection aircraft [NLR-MP-84052-U] p 295 N86-19318

**AIR FLOW**

Air flow and particle trajectories around aircraft fuselages. III - Extensions to particles of arbitrary shape p 316 A86-23281

An analytical method of the characteristics of the turbofan engine components p 304 A86-25201

Design and testing of a large scale helicopter fuselage model in the RAE 5 metre pressurized wind tunnel p 292 A86-26163

Modular air shut-off valve [AD-D011935] p 321 N86-18728

**AIR INTAKES**

Optical fibers application to visualization of flow separation inside an aircraft intake in wind tunnel [ONERA, TP NO. 1985-158] p 309 A86-24638

**AIR LAUNCHING**

Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed [AD-A160862] p 294 N86-18322

**AIR NAVIGATION**

Inertial navigation - The beginnings of an ingenious invention p 282 A86-25025

Effects of measurement errors on estimation of the probability of vertical overlap p 280 A86-25214

High dynamic GPS receiver validation demonstration [NASA-CR-176530] p 283 N86-19306

**AIR TRAFFIC CONTROL**

Mode-S beacon system to cover all U.S. upper airspace by 1991 p 281 A86-23376

Calibration of an on-ground aircraft tracking radar by aerial photogrammetry [NAL-TR-861] p 282 N86-18311

Video processor for air traffic control beacon system [NASA-CASE-KSC-11155-1] p 283 N86-19304

**AIRBORNE EQUIPMENT**

Some thoughts on the vibration testing of helicopter equipment in the UK p 283 A86-23022

Inflight resolution evaluation for thermal imaging systems p 296 A86-23272

Air Force Flight Test Instrumentation System - An introduction for flight test engineers and managers p 296 A86-23275

Airborne diagnostic equipment p 297 A86-23762

The measuring and control units of airborne recording systems p 297 A86-23763

Remote sensing of oil on sea: Lidar and passive IR experiments p 320 N86-18370

Joint agency turbulence experiment [AD-A160420] p 325 N86-18924

Flight test evaluation of the Netherlands flight inspection aircraft [NLR-MP-84052-U] p 295 N86-19318

**AIRBORNE LASERS**

Sensor system concept for future fighter and strike aircraft p 297 A86-24583

**AIRBORNE SURVEILLANCE RADAR**

Airborne radar. I - Air-to-surface p 296 A86-23293

**AIRBORNE/SPACEBORNE COMPUTERS**

A VME bus microcomputer system for experiment control and analysis on board an aircraft p 297 A86-23313

A study of programmable switch symbology — for cockpits p 329 A86-23708

The possibility of using the on-board computer for in-flight diagnostics p 297 A86-23765

**AIRCRAFT ACCIDENT INVESTIGATION**

Affordable safety p 269 A86-25850

**AIRCRAFT ACCIDENTS**

1985 - A turning point for safety? p 280 A86-25849

General aviation crashworthiness project, phase 3: Acceleration loads and velocity changes of survivable general aviation accidents [NTSB/SR-85/02] p 280 N86-18306

Aircraft accident reports: Brief formats, US civil and foreign aviation, issue number 1 of 1984 accidents [PB85-916920] p 281 N86-18309

Aircraft accident reports: Brief format US Civil and Foreign Aviation, issue 2 of 1984 accidents [PB85-916921] p 281 N86-18310

**AIRCRAFT ANTENNAS**

Antenna siting on helicopters p 282 A86-26133

**AIRCRAFT CARRIERS**

Determination of limitations for helicopter ship-borne operations p 280 A86-26151

**AIRCRAFT COMMUNICATION**

Communication with land vehicles and aircraft via satellite p 319 A86-25016

Effects of noise and workload on a communication task [AD-A160743] p 321 N86-18599

High dynamic GPS receiver validation demonstration [NASA-CR-176530] p 283 N86-19306

**AIRCRAFT COMPARTMENTS**

A propeller model for studying trace velocity effects on interior noise p 284 A86-23191

Fire-retardent decorative inks for aircraft interiors [NASA-TM-86198] p 313 N86-18441

**AIRCRAFT CONFIGURATIONS**

Figures of out surface of an airplane model p 288 A86-25237

Optimal lifting surfaces of wings of complex configurations at supersonic flight velocities p 288 A86-25423

Nucleation of ice crystals in supercooled clouds caused by passage of an airplane p 323 A86-26175

Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed [AD-A160862] p 294 N86-18322

**AIRCRAFT CONSTRUCTION MATERIALS**

Current concepts of composite applications in aircraft and engines p 312 A86-23690

A numerical analysis of singular stress fields at the free edge of layered composites [ONERA, TP NO. 1985-154] p 313 A86-24636

High-temperature composite ducts [SME PAPER MF85-501] p 319 A86-24663

Composites in the development of Agusta helicopters p 320 A86-26121

ARALL - A light weight structural material for impact and fatigue sensitive structures p 313 A86-26156

Sukhoy design bureau builds sport plane made of plastic p 294 N86-18324

**AIRCRAFT CONTROL**

Composite statistical method for modeling wind gusts p 308 A86-23189

A stable discrete-time adaptive observer applied to multivariable aircraft p 305 A86-23346

Computer controlled variable pressure reducing/shut-off valve for aircraft ECS [SAE PAPER 851380] p 285 A86-23545

A preliminary flight evaluation of the peripheral vision display using the NT-33A aircraft p 297 A86-23729

A possible approach to the diagnostics of the hydraulic servomechanism of the aircraft control system p 285 A86-23757

Proposal for the choice of state variables for equations of motion of aircraft in moving air p 306 A86-24588

The HUD as a primary flight instrument [SAE PAPER 841463] p 298 A86-26006

Flight deck displays for managing wind shear encounters [SAE PAPER 841465] p 298 A86-26008

Advances in simulation, control and guidance and other systems for manned and unmanned aircraft p 269 A86-26072

Determination of performance and stability characteristics from dynamic maneuvers with a transport aircraft using parameter identification techniques [NLR-MP-84024-U] p 308 N86-19326

Study on the digital position transducer with optical time-delay pulse [NAS-TR-878] p 322 N86-19583

**AIRCRAFT DESIGN**

A class of airfoils having finite trailing-edge pressure gradients p 270 A86-23184

The role of the Flight Test Department in the development of new technology aircraft p 285 A86-23271

The problem of optimizing the final design modifications of stochastic oscillatory systems p 316 A86-23651

Aerodynamic design of an airfoil with allowance for the condition of nonseparated flow p 270 A86-23660

Problems in rudder design for small transport aircraft p 306 A86-23781

The A320 wing - Designing for commercial success p 286 A86-23799

A new direction in energy conversion - The all-electric aircraft p 319 A86-24830

The helicopter and the other VTOL designs - An Interavia reader's manual p 287 A86-24989

Lavi - Advanced fighter and industrial springboard p 287 A86-24990

Computer-aided 'somatography' for the ergonomic design of the ATTAS experimental cockpit --- Advanced Technologies Testing Aircraft System p 287 A86-25024

Aircraft design at Kingston Polytechnic p 333 A86-25090

Energy saving in aircraft p 288 A86-25188

Figures of out surface of an airplane model p 288 A86-25237

Structural airworthiness - A decade of developments p 288 A86-25925

Flight deck automation decisions
[SAE PAPER 841471] p 326 A86-26002

Flight deck design methodology using computerized anthropometric models
[SAE PAPER 841472] p 326 A86-26003

Advanced fighter technology integration (AFTI) F-16 - The pilot interface
[SAE PAPER 841633] p 327 A86-26018

Tomorrow . . . Concorde's successor? p 293 A86-26299

Calculation of the external nacelle surface for single and double stream jet engines for civil aircraft
[VTH-M-445] p 277 N86-18301

Features of planned IL-96-300, IL-114 aircraft p 294 N86-18325

An introduction to the application of Computer Aided Design (CAD) to the predesign of aircraft and the design of aircraft structures at the Aerospace Section
[VTH-M-512] p 330 N86-19045

Technical evaluation report on the Fluid Dynamics Panel Symposium on Aerodynamics and Acoustics of Propellers
[AGARD-AR-213] p 279 N86-19298

Ground vibration test results for Drones for Aerodynamic and Structural Testing (DAST)/Aeroelastic Research Wing (ARW-1R) aircraft
[NASA-TM-85906] p 294 N86-19312

**AIRCRAFT DETECTION**

Probabilistic evaluation of individual aircraft tracking techniques
[AD-A160146] p 282 N86-18312

Performance of resonant radar target identification algorithms using intra-class weighting functions p 321 N86-19490

**AIRCRAFT ENGINES**

A propeller model for studying trace velocity effects on interior noise p 284 A86-23191

Engine/airframe health and usage monitoring an alternate approach via advanced vibration monitoring systems p 296 A86-23255

Flight test data acquisition and processing system p 329 A86-23263

A new high temperature silicon on sapphire transducer for jet engine control applications p 315 A86-23266

A flight evaluation of a digital electronic engine control p 299 A86-23273

Determination of the service life of aviation oils p 312 A86-23450

Digital control for engine bleed air
[SAE PAPER 851316] p 300 A86-23506

The effect of the velocity profile at the diffuser inlet on the flow pattern p 300 A86-23664

Emission characteristics of a section of the combustion chamber of a gas-turbine engine with various modifications of the burners p 300 A86-23670

Current concepts of composite applications in aircraft and engines p 312 A86-23690

Diagnostic methods for gas-turbine aircraft powerplants p 300 A86-23751

Determination of diagnostic parameters for the in situ diagnostics of the air-gas path of the AI-25TL engine p 300 A86-23752

Sound generation by an energetically inhomogeneous gas flow in a gas-turbine aircraft engine p 300 A86-23753

Simulation of the vibration transmission path and the use of a mathematical model of vibration transmission for the vibrational diagnostics of an aircraft engine p 301 A86-23754

In situ methods for crack detection in the master connecting rods of M 462 RF aircraft engines p 316 A86-23755

A holographic study of the vibrational modes of aircraft engine rotors p 301 A86-23756

Using wear products for assessing and predicting the condition of aircraft jet engines p 316 A86-23759

Discussion about dynamic simulation test of an aero-engine control system
[ASME PAPER 85-IGT-30] p 308 A86-23845

Method of spare parts - Digital simulation of aircraft turbine engine control system
[ASME PAPER 85-IGT-52] p 301 A86-23856

Optimal control change of state of aircraft turbine engine
[ASME PAPER 85-IGT-53] p 301 A86-23859

The finite element stress analysis for solid-shell combined parts in aeroengines
[ASME PAPER 85-IGT-72] p 317 A86-23873

Measurement of turbine blade temperature using pyrometer
[ASME PAPER 85-IGT-78] p 317 A86-23879

State of the art in aircraft gas turbine technology
[ASME PAPER 85-IGT-87] p 302 A86-23888

A survey of accelerated vibratory fatigue test method of aero-engine compressor blade
[ASME PAPER 85-IGT-105] p 317 A86-23904

Further applications of the Lucas fan spray fuel injection combustion system
[ASME PAPER 85-IGT-116] p 302 A86-23912

Gas turbine combustion efficiency
[ASME PAPER 85-IGT-121] p 302 A86-23917

Fuel deposit characteristics at low velocity
[ASME PAPER 85-IGT-130] p 313 A86-23922

Life prediction for the main shaft of aircraft turbine engine
[ASME PAPER 85-IGT-136] p 303 A86-23928

Investigation into the cause of failure of a turboprop impeller in service
[ASME PAPER 85-IGT-147] p 303 A86-23938

The forced response of shrouded fan stages
[ASME PAPER 85-DET-19] p 303 A86-24226

Heat transfer problems in aero-engines p 272 A86-24470

Fundamental heat transfer research for gas turbine engines NASA workshop overview p 272 A86-24471

The prop-fan introduces a new engine generation p 304 A86-25021

A world review on air breathing engine altitude test facilities p 310 A86-25197

Electronic display of powerplant parameters
[SAE PAPER 841467] p 298 A86-26010

Flat rating concept introduced in the GTX engine p 304 A86-26071

T700 - A program designed for early maturity and growth potential p 305 A86-26156

Interactive effects of high- and low-frequency loading on fatigue
[AD-A160601] p 293 N86-18318

**AIRCRAFT EQUIPMENT**

Evolution of emerging environmental testing and evaluation techniques p 315 A86-23011

Airborne instrumentation magnetic tape recording thru the early 90's p 315 A86-23253

Design of the F-16 aircraft electrical system built-in-test monitor p 298 A86-24827

**AIRCRAFT FUEL SYSTEMS**

Aircraft fuel pump design p 300 A86-23350

**AIRCRAFT FUELS**

Gas turbine fuels and their influence on combustion --- Book p 312 A86-23274

**AIRCRAFT GUIDANCE**

New nose-in aircraft guidance/docking system developed p 308 A86-23380

Aircraft approach guidance using relative Loran-C navigation p 282 A86-24533

**AIRCRAFT HAZARDS**

The aircraft icing environment in wintertime, low ceiling conditions
[AD-A160578] p 280 N86-18307

Some microphysical processes affecting aircraft icing
[AD-A160375] p 325 N86-18921

Joint agency turbulence experiment
[AD-A160420] p 325 N86-18924

Calculation of ice accretion on cylindrical rods according to Bain's model, and comparison with experimental results --- stratus clouds
[DFVLR-FB-85-46] p 325 N86-18933

**AIRCRAFT HYDRAULIC SYSTEMS**

A possible approach to the diagnostics of the hydraulic servomechanism of the aircraft control system p 285 A86-23757

**AIRCRAFT INDUSTRY**

The world aircraft industry --- Book p 269 A86-26114

**AIRCRAFT INSTRUMENTS**

Use of video cassette recorders for combined video and PCM data recording p 315 A86-23256

Economical in-flight calibration of air data sensors using inertial navigation units as reference p 284 A86-23270

Sensor system concept for future fighter and strike aircraft p 297 A86-24583

Presentation of information on multimode displays - Abnormal and emergency aircraft operations
[SAE PAPER 841494] p 298 A86-26012

Cockpit advances in Boeing Vertol Company's Model 360 helicopter
[SAE PAPER 841629] p 298 A86-26032

**AIRCRAFT LANDING**

The data transmission and processing equipment of a high-precision trajectory measurement system p 296 A86-22728

Aeroacoustics of an advanced propeller design under takekoff and landing conditions p 284 A86-23190

The utility of Head-Up Displays - Eye-focus vs decision times p 297 A86-23728

Simulator design features for helicopter landing on small ships p 308 A86-23750

A first step for reducing helicopter IFR approach minima Agusta A109 IFR CAT II certification p 280 A86-26127

Wind shear investigation program at the NLR
[NLR-MP-84027-U] p 325 N86-19808

**AIRCRAFT MAINTENANCE**

AVIP Air Force thrust for reliability --- AVionics Integrity Programs p 315 A86-23003

Testability of aircraft p 269 A86-23760

Rotorcraft trends. II - Requirements and monitoring p 287 A86-25089

Reliability and structural inspection program for transport aeroplanes p 269 A86-25176

Affordable safety p 269 A86-25850

The health and usage monitoring system of the Westland 30 series 300 helicopter p 299 A86-26153

**AIRCRAFT MANEUVERS**

The use of analytical methods to assess aircraft maneuverability p 305 A86-23771

Comparative analysis of two methods for evaluating the loads acting on the tail plane during a symmetric manoeuvre p 287 A86-25095

An analysis of the influence of the duration and sharpness of a symmetric manoeuvre on the load acting on the tail plane p 287 A86-25096

Studies of rotorcraft agility and maneuverability p 291 A86-26145

A computer based study of helicopter agility, including the influence of an active tailplane p 291 A86-26146

Helicopter maneuvre stability - A new twist p 307 A86-26160

**AIRCRAFT MODELS**

Frequency methods of aircraft identification --- Russian book p 306 A86-24148

The effectiveness of various control surfaces in quasi-steady and unsteady flows - Applications
[ONERA, TP NO. 1985-147] p 306 A86-24633

Dynamic support interference in high alpha testing --- of aircraft models
[AIAA PAPER 86-0760] p 309 A86-24746

Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model
[AIAA PAPER 86-0780] p 286 A86-24759

Figures of out surface of an airplane model p 288 A86-25237

Design and testing of a large scale helicopter fuselage model in the RAE 5 metre pressurized wind tunnel p 292 A86-26163

**AIRCRAFT NOISE**

Aeroacoustics of an advanced propeller design under takekoff and landing conditions p 284 A86-23190

A propeller model for studying trace velocity effects on interior noise p 284 A86-23191

Noise levels in cockpits of aircraft during normal cruise and considerations of auditory risk p 326 A86-25651

A theoretical analysis of the effect of thrust-related turbulence distortion on helicopter rotor low-frequency broadband noise p 289 A86-26113

Current wind tunnel capability and planned improvements at Lewis Research Center
[NASA-TM-87190] p 311 N86-18329

Effects of noise and workload on a communication task
[AD-A160743] p 321 N86-18599

Report of noise measurements with 2 different microphone dispositions on airplane type Cessna F 172L
[VTH-M-510] p 332 N86-19143

Technical evaluation report on the Fluid Dynamics Panel Symposium on Aerodynamics and Acoustics of Propellers
[AGARD-AR-213] p 279 N86-19298

Hover and forward flight acoustics and performance of a small-scale helicopter rotor system
[NASA-TM-86584] p 295 N86-19314

Acoustic guide for noise transmission testing of aircraft
[NASA-CASE-LAR-13111-1-CU] p 332 N86-20086

Status and capabilities of sonic boom simulators
[NASA-TM-87664] p 332 N86-20088

International Civil Aviation Organization Helicopter Noise Measurement Repeatability Program: US test report, Bell 206L-1, noise measurement flight test
[AD-A159898] p 333 N86-20090

**AIRCRAFT PARTS**
The possibility of using the on-board computer for in-flight diagnostics p 297 A86-23765
Locating and demagnetizing magnetized aircraft components following a lightning stroke p 286 A86-23767
Effect of seat cushions of human respone to +Gz impact p 326 A86-25652
Manufacturing control over the reproduction of high integrity parts - A way to improve the safety of aeronautical products p 320 A86-26122
Aviaremont's efforts to introduce laser technology p 320 N86-18266

**AIRCRAFT PERFORMANCE**
Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings p 284 A86-23252
The F-16XL flight test program p 284 A86-23260
The possibility of using the on-board computer for in-flight diagnostics p 297 A86-23765
Supersonic passenger decade p 288 A86-25848
Determination of performance and stability characteristics from dynamic maneuvers with a transport aircraft using parameter identification techniques
[NLR-MP-84024-U] p 308 N86-19326

**AIRCRAFT PILOTS**
Situation versus command --- flight information for pilots
[SAE PAPER 841638] p 328 A86-26023
U.S. Army helicopter voice technology applications
[SAE PAPER 841609] p 328 A86-26028

**AIRCRAFT POWER SUPPLIES**
Design of the F-16 aircraft electrical system built-in-test monitor p 298 A86-24827
Electric power management and distribution for air and space applications p 319 A86-24828
Efficiently meeting electric power needs for future aircraft p 319 A86-24829
Development of autonomous power system testbed p 311 A86-24841
Design and development of an inertial power supply unit for carrier-based aircraft p 304 A86-24861

**AIRCRAFT PRODUCTION**
Robotic applications to automated composite aircraft component manufacturing
[SME PAPER MF85-506] p 319 A86-24667
Composites in the development of Agusta helicopters p 320 A86-26121
Manufacturing control over the reproduction of high integrity parts - A way to improve the safety of aeronautical products p 320 A86-26122

**AIRCRAFT RELIABILITY**
AVIP Air Force thrust for reliability --- AVionics Integrity Programs p 315 A86-23003
Evolution of emerging environmental testing and evaluation techniques p 315 A86-23011
Unscreened part reliability rivals that of screened parts in new digital avionics p 315 A86-23015
Some thoughts on the vibration testing of helicopter equipment in the UK p 283 A86-23022
Engine/airframe health and usage monitoring an alternate approach via advanced vibration monitoring systems p 296 A86-23255
Testability of aircraft p 269 A86-23760
Rotorcraft trends. II - Requirements and monitoring p 287 A86-25089
Reliability and structural inspection program for transport aeroplanes p 269 A86-25176
Structural airworthiness - A decade of developments p 288 A86-25925
Airworthiness aspects of fatigue in helicopters p 280 A86-26128
The health and usage monitoring system of the Westland 30 series 300 helicopter p 299 A86-26153
Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed
[AD-A160862] p 294 N86-18322

**AIRCRAFT SAFETY**
Longitudinal flying qualitites criteria for single-pilot instrument flight operations p 305 A86-23186
An improved smoke generator for aircraft testing p 308 A86-23265
1985 - A turning point for safety? p 280 A86-25849
Affordable safety p 269 A86-25850
Manufacturing control over the reproduction of high integrity parts - A way to improve the safety of aeronautical products p 320 A86-26122
Safety aspects in stores management systems p 299 A86-26132
Tests on whole A129 engine bay simulating the inertia and aerodynamic loads p 292 A86-26164
Probabilistic evaluation of individual aircraft tracking techniques
[AD-A160146] p 282 N86-18312
Atmospheric electricity hazards threat environment definition
[AD-A159730] p 324 N86-18909
Microburst wind shear models from the Joint Airport Weather Studies (JAWS)
[AD-A159758] p 324 N86-18910

**AIRCRAFT STABILITY**
Liapunov function for studying the stability in the whole of nonlinear systems p 331 A86-23576
New aspects of the small-perturbation method in aerodynamics p 271 A86-23770
Pressure fluctuations on the external surface of an aircraft p 271 A86-23780
Proposal for the choice of state variables for equations of motion of aircraft in moving air p 306 A86-24588
Aeromechanical stability analysis of a multirotor vehicle with application to hybrid heavy lift helicopter dynamics p 290 A86-26141
Analytical and experimental results of the ground resonance phenomenon for A.129 p 291 A86-26142
Helicopter maneuvre stability - A new twist p 307 A86-26160
Helicopter attitude stabilization using individual-blade-control p 307 A86-26170

**AIRCRAFT STRUCTURES**
AVIP Air Force thrust for reliability --- AVionics Integrity Programs p 315 A86-23003
The problem of optimizing the final design modifications of stochastic oscillatory systems p 316 A86-23651
A theory of large and finite displacements of bars p 316 A86-23662
Methods for determining the weight and the center of gravity of aircraft - The platform balance of the Aeronautical Research and Test Institute p 266 A86-23768
Autoparametric vibration of coupled beams under random support motion
[ASME PAPER 85-DET-184] p 318 A86-24246
High-temperature composite ducts
[SME PAPER MF85-501] p 319 A86-24663
Reliability and structural inspection program for transport aeroplanes p 269 A86-25176
Structural airworthiness - A decade of developments p 288 A86-25925
ARALL - A light weight structural material for impact and fatigue sensitive structures p 313 A86-26158
An introduction to the application of Computer Aided Design (CAD) to the predesign of aircraft and the design of aircraft structures at the Aerospace Section
[VTH-M-512] p 330 N86-19045
Fatigue crack propagation under spectrum loading
[NAL-TM-MT-8502] p 322 N86-19656
Application of mathematical optimization procedures to a structural model of a large finite-element wing
[NASA-TM-87597] p 322 N86-19051

**AIRFOIL PROFILES**
Aerodynamic design of an airfoil with allowance for the condition of nonseparated flow p 270 A86-23660
Practical difficulties in the theoretical design of low-speed profiles p 271 A86-23775
Development of numerical methods of external high-speed aerodynamics p 271 A86-23777
Post stall studies of untwisted varying aspect ratio blades with NACA 44XX series. II - Airfoil sections p 272 A86-24522
Stator row unsteady aerodynamics due to wake excitations p 273 A86-24703
Test cases for the plane potential flow past multi-element aerofoils p 275 A86-25670
The conformal representation of the NACA 642A015 profile
[VTH-M-502] p 277 N86-18296
On the longest chord of the first Muller profile
[VTH-M-486] p 277 N86-18303

**AIRFOILS**
The response of airfoils to periodic disturbances - The unsteady Kutta condition
[AIAA PAPER 84-0050] p 270 A86-23126
Airfoil tip vortex formation noise p 331 A86-23134
Compressibility corrections for multifoil sections p 270 A86-23193
The development of a second-generation of Controlled Diffusion Airfoils for multistage compressors
[ASME PAPER 85-IGT-9] p 271 A86-23830
Aerodynamic performances of fabric surface airfoils p 275 A86-25224
An experimental investigation of the influence of a range of aerofoil design features on dynamic stall onset p 288 A86-26104
Design of the 225-knot conventional rotor p 289 A86-26116
Calculation of helicopter airfoil characteristics for high tip-speed applications
[AD-A160694] p 277 N86-18294
Aerodynamic transfer functions for a finite wing in incompressible flow
[NAL-TR-867] p 278 N86-19286

**AIRFRAME MATERIALS**
Electrical connections and antenna performance of a large composite fuselage module in the high frequency range p 292 A86-26157

**AIRFRAMES**
Surfaces on a nonrectangular frame p 316 A86-23663
A study of the service life of fail-safe airframe structures on the basis of routine inspections and crack size assessment p 286 A86-23769
Effectiveness of fatigue life enhancing fasteners in the design and rework of aircraft structures
[AD-A159676] p 293 N86-18316

**AIRPORTS**
New nose-in aircraft guidance/docking system developed p 306 A86-23380
Limited Surface Observations Climatic Summary (LISOCS). Parts A, C-F: Bremen International, West Germany
[AD-A159656] p 323 N86-18894
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: General Billy Mitchell Field, Wisconsin
[AD-A159658] p 324 N86-18896
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: Aviano AB, Italy
[AD-A159662] p 324 N86-18900
Giebelstadt ain Germany (West). Limited surface observations climatic summary (LISOCS): Parts A, C-F
[AD-A159664] p 324 N86-18902
Catalog of air weather service technical documents
[AD-A159661] p 324 N86-18912

**AIRSPEED**
A class of airfoils having finite trailing-edge pressure gradients p 270 A86-23184
Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed
[AD-A160862] p 294 N86-18322
International Civil Aviation Organization Helicopter Noise Measurement Repeatability Program: US test report, Bell 206L-1, noise measurement flight test
[AD-A159898] p 333 N86-20090

**ALGORITHMS**
Performance of resonant radar target identification algorithms using intra-class weighting functions p 321 N86-19490

**ALTIMETERS**
Effects of digital altimetry on pilot workload
[SAE PAPER 841489] p 327 A86-26019
Horizontal display for vertical flight: A direction of motion experiment
[AD-A161113] p 299 N86-19321
Analytical evaluations of accuracy in determining and predicting parameters of artificial Earth satellite motion using altimeter measurement data p 312 N86-20196

**ALTITUDE TESTS**
A world review on air breathing engine altitude test facilities p 310 A86-25197

**ANECHOIC CHAMBERS**
Current wind tunnel capability and planned improvements at Lewis Research Center
[NASA-TM-87190] p 311 N86-18329

**ANGLE OF ATTACK**
A class of airfoils having finite trailing-edge pressure gradients p 270 A86-23184
Results of high angle-of-attack testing of the F-15 with conformal fuel tanks p 284 A86-23267
The role of wind tunnel testing in future aircraft development
[AIAA PAPER 86-0750] p 309 A86-24739
On hypersonic flow around winged-vehicles at high angles of attack p 275 A86-25227
Generation of the starting plane flowfield for supersonic flow over a spherically capped body
[AD-A161117] p 278 N86-19291

**ANNULAR FLOW**
Aerodynamic research on straight wall annular diffuser for turbofan augmentor
[ASME PAPER 85-IGT-16] p 271 A86-23834

**ANTENNA ARRAYS**
Simple technique moistureproofs ILS localizer antenna array p 282 A86-23379

**ANTENNA COMPONENTS**
Electrical connections and antenna performance of a large composite fuselage module in the high frequency range p 292 A86-26157

**ANTENNA COUPLERS**
Electrical connections and antenna performance of a large composite fuselage module in the high frequency range p 292 A86-26157

**ANTENNA DESIGN**
Electrical connections and antenna performance of a large composite fuselage module in the high frequency range p 292 A86-26157

**ANTENNA RADIATION PATTERNS**
Prediction and measurement of near fields for antennas on structures p 316 A86-23403
Antenna siting on helicopters p 282 A86-26133
**ANTITANK MISSILES**
The project for anti-tank helicopter p 290 A86-26124
**APPROACH CONTROL**
Aircraft approach guidance using relative Loran-C navigation p 282 A86-24533
**APPROACH INDICATORS**
The data transmission and processing equipment of a high-precision trajectory measurement system p 296 A86-22728
**ARMED FORCES (UNITED STATES)**
AI applications to military pilot decision aiding - A perspective on transition
[SAE PAPER 841533] p 327 A86-26004
An electronic index of articles pertaining to Air Force transportation in the post-World War 2 era, with abstracts of selected articles
[AD-A160637] p 281 N86-18308
A comparative evaluation of the reliability improvement in line replaceable units warranted under the F-16 reliability improvement warranty
[AD-A160630] p 321 N86-18630
Research and development project selection methods at the air Force Wright Aeronautical Laboratories
[AD-A161153] p 333 N86-20165
**ASPECT RATIO**
Post stall studies of untwisted varying aspect ratio blades with NACA 44XX series. II - Airfoil sections p 272 A86-24522
**ATMOSPHERIC CIRCULATION**
In-flight turbulence detection
[AD-A160380] p 325 N86-18923
**ATMOSPHERIC EFFECTS**
The 737 graphite composite flight spoiler flight service evaluation
[NASA-CR-172600] p 314 N86-18448
**ATMOSPHERIC ELECTRICITY**
Atmospheric electricity hazards threat environment definition
[AD-A159739] p 324 N86-18909
**ATMOSPHERIC PRESSURE**
Limited Surface Observations Climatic Summary (LISOCS). Parts A, C-F: Bremen International, West Germany
[AD-A159656] p 323 N86-18894
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: General Billy Mitchell Field, Wisconsin
[AD-A159658] p 324 N86-18896
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: Aviano AB, Italy
[AD-A159662] p 324 N86-18900
Giebelstadt ain Germany (West). Limited surface observations climatic summary (LISOCS): Parts A, C-F
[AD-A159664] p 324 N86-18902
**ATMOSPHERIC SOUNDING**
Deduction of vertical motion in the atmosphere from aircraft measurements p 323 A86-23292
Long-duration flights using infrared Montgolfieres p 323 N86-18861
**ATMOSPHERIC TURBULENCE**
Progress in the analysis of atmospheric turbulence
[ONERA, TP NO. 1985-164] p 323 A86-24631
Helicopter active control with blade stall alleviation modal capability p 307 A86-26136
**ATTACK AIRCRAFT**
Advanced fighter technology integration (AFTI) F-16 - The pilot interface
[SAE PAPER 841633] p 327 A86-26018
**ATTITUDE CONTROL**
An investigation of the use of bandwidth criteria for rotorcraft handling-qualities specifications
[AD-A160664] p 294 N86-18319
**ATTITUDE STABILITY**
Helicopter attitude stabilization using individual-blade-control p 307 A86-26170
**AUDITORY DEFECTS**
Noise levels in cockpits of aircraft during normal cruise and considerations of auditory risk p 326 A86-25651
**AUGMENTATION**
Aerodynamic research on straight wall annular diffuser for turbofan augmentor
[ASME PAPER 85-IGT-16] p 271 A86-23834
**AUTOMATED PILOT ADVISORY SYSTEM**
Situation versus command --- flight information for pilots
[SAE PAPER 841636] p 326 A86-26023
**AUTOMATIC CONTROL**
Automation effects in a multiloop manual control system p 329 A86-25035
Flight deck automation decisions
[SAE PAPER 841471] p 326 A86-26002
Automation in the cockpit - Who's in charge?
[SAE PAPER 841534] p 327 A86-26005
**AUTOMATIC FLIGHT CONTROL**
Winging it in the 1980's - Why guidelines are needed for cockpit automation
[SAE PAPER 841634] p 326 A86-26022
Situation versus command --- flight information for pilots
[SAE PAPER 841636] p 326 A86-26023
**AUTOMATIC LANDING CONTROL**
Automatic landing through the turbulent planetary boundary layer
[UTIAS-289] p 283 N86-19305
**AUTOMATIC PILOTS**
Automatic landing through the turbulent planetary boundary layer
[UTIAS-289] p 283 N86-19305
**AUTOMATIC TEST EQUIPMENT**
Air Force Flight Test Instrumentation System - An introduction for flight test engineers and managers p 296 A86-23275
Helicopter vibration flight testing - The rotortuner approach p 293 A86-26160
Flight test evaluation of the Netherlands flight inspection aircraft
[NLR-MP-84052-U] p 295 N86-19318
**AUTOMATION**
Cockpit automation technology p 326 A86-23724
**AUXILIARY POWER SOURCES**
A new direction in energy conversion - The all-electric aircraft p 319 A86-24830
**AVIATION PSYCHOLOGY**
Presentation of information on multimode displays - Abnormal and emergency aircraft operations
[SAE PAPER 841494] p 298 A86-26012
The decision to fly --- by aircraft pilots
[SAE PAPER 841613] p 328 A86-26024
**AVIONICS**
AVIP Air Force thrust for reliability --- AVionics Integrity Programs p 315 A86-23003
Unscreened part reliability rivals that of screened parts in new digital avionics p 315 A86-23015
Automated Electromagnetic Compatibility (EMC) testing of Naval aircraft and integrated avionics p 284 A86-23254
A flight evaluation of a digital electronic engine control p 299 A86-23273
Efficiently meeting electric power needs for future aircraft p 319 A86-24829
Development testing of integrated avionics systems using dynamic environment simulation p 330 A86-26166
A comparative evaluation of the reliability improvement in line replaceable units warranted under the F-16 reliability improvement warranty
[AD-A160630] p 321 N86-18630
**AXIAL FLOW TURBINES**
Investigation of a tip clearance cascade in a water analogy ring
[ASME PAPER 85-IGT-65] p 270 A86-22730
**AXIAL LOADS**
Fiber-reinforced plastic composites for energy absorption purposes p 312 A86-23823
**AXISYMMETRIC BODIES**
Applications of an analysis of axisymmetric body effects on rotor performance and loads p 289 A86-26105
**AXISYMMETRIC FLOW**
Longitudinal potential distribution in a jet of an ionized gas p 331 A86-23674
Generation of the starting plane flowfield for supersonic flow over a spherically capped body
[AD-A161117] p 278 N86-19291

B

**B-1 AIRCRAFT**
Digital control for engine bleed air
[SAE PAPER 851316] p 300 A86-23506
**B-52 AIRCRAFT**
The new environmental control system for the B-52 G/H aircraft
[SAE PAPER 851320] p 285 A86-23510
**BACKSCATTERING**
Performance of resonant radar target identification algorithms using intra-class weighting functions p 321 N86-19490
**BALLOON SOUNDING**
Long-duration flights using infrared Montgolfieres p 323 N86-18861
**BALLOONS**
Long-duration flights using infrared Montgolfieres p 323 N86-18861
**BANDWIDTH**
An investigation of the use of bandwidth criteria for rotorcraft handling-qualities specifications
[AD-A160664] p 294 N86-18319
**BEAMS (SUPPORTS)**
Autoparametric vibration of coupled beams under random support motion
[ASME PAPER 85-DET-184] p 318 A86-24246
**BEARINGS**
Elastomeric rod end bearings - A solution for improving reliability and maintainability p 320 A86-26125
**BENDING MOMENTS**
Aeroelastic oscillations caused by transitional boundary layers and their attenuation
[AIAA PAPER 86-0736] p 286 A86-24731
**BENDING VIBRATION**
Feasibility of simplifying coupled lag-flap-torsional models for rotor blade stability in forward flight p 290 A86-26138
**BIBLIOGRAPHIES**
An electronic index of articles pertaining to Air Force transportation in the post-World War 2 era, with abstracts of selected articles
[AD-A160637] p 281 N86-18308
**BLADE TIPS**
Investigation of a tip clearance cascade in a water analogy ring
[ASME PAPER 85-IGT-65] p 270 A86-22730
Comparative measurements of the unsteady pressures and the tip-vortex parameters on four oscillating wing tip models p 273 A86-24708
Some calculations of tip vortex - Blade loadings p 276 A86-26107
Comparative measurements of the unsteady pressures and the tip-vortex parameters of four oscillating wing tip models p 276 A86-26109
Theoretical prediction of running-time measurements in unsteady flow --- for various shapes of rotor blade tips p 276 A86-26112
**BO-105 HELICOPTER**
DFVLR flying qualities research using operational helicopters p 307 A86-26147
DFVLR helicopter in-flight simulator for flying quality research p 310 A86-26148
**BODY-WING AND TAIL CONFIGURATIONS**
Figures of out surface of an airplane model p 288 A86-25237
**BODY-WING CONFIGURATIONS**
Aerodynamic characteristics of slender wing-gap-body combinations. II p 275 A86-25240
**BOEING AIRCRAFT**
Unscreened part reliability rivals that of screened parts in new digital avionics p 315 A86-23015
Cockpit advances in Boeing Vertol Company's Model 360 helicopter
[SAE PAPER 841629] p 298 A86-26032
**BOMBER AIRCRAFT**
B-52G crew noise exposure study
[AD-A161112] p 333 N86-20094
**BOOMS (EQUIPMENT)**
Correlation of results of an OH-58A helicopter composite tail boom test with a finite element model
[AD-A161062] p 295 N86-19316
**BOUNDARY LAYER FLOW**
Wind tunnel calibration of a PMS (Particle Measuring Systems) canister instrumented for airflow measurement
[AD-A161124] p 278 N86-19292
**BOUNDARY LAYER SEPARATION**
Recent computational fluid dynamics works about high angle of attack aerodynamics with separation vortex p 274 A86-25206
Review of theory of vortex separated from a leading edge of a delta wing p 275 A86-25207
**BOUNDARY LAYER TRANSITION**
Aeroelastic oscillations caused by transitional boundary layers and their attenuation
[AIAA PAPER 86-0736] p 286 A86-24731
**BOXES (CONTAINERS)**
The design of an advanced engineering gearbox p 320 A86-26155
**BURNERS**
Emission characteristics of a section of the combustion chamber of a gas-turbine engine with various modifications of the burners p 300 A86-23670

C

**CALIBRATING**
Economical in-flight calibration of air data sensors using inertial navigation units as reference p 284 A86-23270
Future requirements of wind tunnels for CFD code verification
[AIAA PAPER 86-0753] p 309 A86-24712

Calibration of an on-ground aircraft tracking radar by aerial photogrammetry
[NAL-TR-861] p 282 N86-18311

**CANARD CONFIGURATIONS**
An experimental study of a high performance canard airfoil with boundary layer trip and vortex generators
[AIAA PAPER 86-0761] p 273 A86-24760

**CARBON FIBER REINFORCED PLASTICS**
Electrical connections and antenna performance of a large composite fuselage module in the high frequency range p 292 A86-26157

**CARET WINGS**
On hypersonic flow around winged-vehicles at high angles of attack p 275 A86-25227

**CASCADE CONTROL**
Automation effects in a multiloop manual control system p 329 A86-25035

**CASCADE FLOW**
Investigation of a tip clearance cascade in a water analogy ring
[ASME PAPER 85-IGT-65] p 270 A86-22730
Excitation of blade vibration by flow induced acoustic resonances in axial-flow compressors
p 303 A86-24712
Navier-Stokes procedure for simulating two-dimensional and quasi-two-dimensional cascade flow
p 274 A86-25006

**CATALOGS**
Catalog of air weather service technical documents
[AD-A159861] p 324 N86-18912

**CATALOGS (PUBLICATIONS)**
Aeronautical facilities catalogue. Volume 2: Airbreathing propulsion and flight simulators
[NASA-RP-1133] p 311 N86-18328

**CATHODE RAY TUBES**
Effect of vibration on the readability of color CRT displays
[SAE PAPER 841466] p 327 A86-26009
CRT displays in modern helicopter data presentation
p 299 A86-26129

**CEILING (AIRCRAFT CAPABILITY)**
The aircraft icing environment in wintertime, low ceiling conditions
[AD-A160578] p 280 N86-18307

**CEILINGS (METEOROLOGY)**
Limited Surface Observations Climatic Summary (LISOCS). Parts A, C-F: Bremen International, West Germany
[AD-A159656] p 323 N86-18894
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: General Billy Mitchell Field, Wisconsin
[AD-A159658] p 324 N86-18896
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: Aviano AB, Italy
[AD-A159662] p 324 N86-18900
Giebelstadt ain Germany (West). Limited surface observations climatic summary (LISOCS): Parts A, C-F
[AD-A159664] p 324 N86-18902

**CENTER OF GRAVITY**
Methods for determining the weight and the center of gravity of aircraft - The platform balance of the Aeronautical Research and Test Institute p 286 A86-23766

**CERTIFICATION**
Flight test evaluation of the Netherlands flight inspection aircraft
[NLR-MP-84052-U] p 295 N86-19318
Determination of performance and stability characteristics from dynamic maneuvers with a transport aircraft using parameter identification techniques
[NLR-MP-84024-U] p 308 N86-19326
International Civil Aviation Organization Helicopter Noise Measurement Repeatability Program: US test report, Bell 206L-1, noise measurement flight test
[AD-A159898] p 333 N86-20090

**CESSNA 172 AIRCRAFT**
Report of noise measurements with 2 different microphone dispositions on airplane type Cessna F 172L
[VTH-M-510] p 332 N86-19143

**CHORDS (GEOMETRY)**
On the longest chord of the first Muller profile
[VTH-M-486] p 277 N86-18303

**CIRCUIT RELIABILITY**
Efficiently meeting electric power needs for future aircraft p 319 A86-24829

**CIRCULATION CONTROL AIRFOILS**
An estimation of the wall interference on a two-dimensional circulation control airfoil
[AIAA PAPER 86-0736] p 273 A86-24732

**CIRCULATION DISTRIBUTION**
Distribution of optimal circulation on a propeller blade with a nonlinear dependence on the number of blades and with allowence tapering p 271 A86-23778
Radial distribution circulation of a rotor in hover measured by laser velocimeter p 276 A86-26110

**CIVIL AVIATION**
An overview of civil helicopter operations - Past, present and future p 279 A86-23600
USSR report: Transportation
[JPRS-UTR-85-014] p 270 N86-18284
Calculation of the external nacelle surface for single and double stream jet engines for civil aircraft
[VTH-M-445] p 277 N86-18301
Aircraft accident reports: Brief formats, US civil and foreign aviation, issue number 1 of 1984 accidents
[PB85-916920] p 281 N86-18309
Aircraft accident reports: Brief format US Civil and Foreign Aviation, issue 2 of 1984 accidents
[PB85-916921] p 281 N86-18310
USSR report: Transportation
[JPRS-UTR-85-015] p 294 N86-18323
Sukhoy design bureau builds sport plane made of plastic p 294 N86-18324
Features of planned IL-96-300, IL-114 aircraft
p 294 N86-18325
High speed aeronautics
[GPO-51-341] p 270 N86-19284
International Civil Aviation Organization Helicopter Noise Measurement Repeatability Program: US test report, Bell 206L-1, noise measurement flight test
[AD-A159898] p 333 N86-20090

**CLASSIFICATIONS**
Comparison of two target classification techniques
p 318 A86-23951

**CLEARANCES**
Investigation of a tip clearance cascade in a water analogy ring
[ASME PAPER 85-IGT-65] p 270 A86-22730

**CLIMATOLOGY**
Limited Surface Observations Climatic Summary (LISOCS). Parts A, C-F: Bremen International, West Germany
[AD-A159656] p 323 N86-18894
Catalog of air weather service technical documents
[AD-A159861] p 324 N86-18912

**CLOUD GLACIATION**
Nucleation of ice crystals in supercooled clouds caused by passage of an airplane p 323 A86-26175

**CLOUD PHYSICS**
Aircraft flow effects on cloud drop images and concentrations measured by the NAE Twin Otter
p 322 A86-23289
Some microphysical processes affecting aircraft icing
[AD-A160375] p 325 N86-18921

**CLOUDS (METEOROLOGY)**
The aircraft icing environment in wintertime, low ceiling conditions
[AD-A160578] p 280 N86-18307
Some microphysical processes affecting aircraft icing
[AD-A160375] p 325 N86-18921

**COCKPIT SIMULATORS**
Wide-angle, low-altitude flight simulator vision system for cockpit research and aircrew training
p 311 A86-26152
Development testing of integrated avionics systems using dynamic environment simulation
p 330 A86-26166
Comparison of pilot effective time delay for cockpit controllers used on space shuttle and conventional aircraft
[NASA-TM-86030] p 307 N86-19324

**COCKPITS**
A study of programmable switch symbology --- for cockpits p 329 A86-23706
Cockpit automation technology p 326 A86-23724
One man and 3,000 million operations a second - Preparing for the LHX cockpit p 286 A86-24986
Computer-aided 'somatography' for the ergonomic design of the ATTAS experimental cockpit --- Advanced Technologies Testing Aircraft System
p 287 A86-25024
Noise levels in cockpits of aircraft during normal cruise and considerations of auditory risk p 326 A86-25651
Flight deck automation decisions
[SAE PAPER 841471] p 326 A86-26002
Flight deck design methodology using computerized anthropometric models
[SAE PAPER 841472] p 326 A86-26003
Automation in the cockpit - Who's in charge?
[SAE PAPER 841534] p 327 A86-26005
Flight deck displays for managing wind shear encounters
[SAE PAPER 841465] p 298 A86-26008
Winging it in the 1980's - Why guidelines are needed for cockpit automation
[SAE PAPER 841634] p 328 A86-26022
Situation versus command --- flight information for pilots
[SAE PAPER 841638] p 328 A86-26023
The decision to fly --- by aircraft pilots
[SAE PAPER 841613] p 328 A86-26024
The development of an advanced helicopter research simulator
[SAE PAPER 841610] p 310 A86-26029
Comparison of voice types for helicopter voice warning systems
[SAE PAPER 841611] p 328 A86-26030
Cockpit advances in Boeing Vertol Company's Model 360 helicopter
[SAE PAPER 841629] p 298 A86-26032
Comparison of pilot effective time delay for cockpit controllers used on space shuttle and conventional aircraft
[NASA-TM-86030] p 307 N86-19324
The role of a real-time flight support facility in flight research programs
[NASA-TM-86805] p 311 N86-19330

**COLOR VISION**
Effect of vibration on the readability of color CRT displays
[SAE PAPER 841466] p 327 A86-26009

**COMBUSTION CHAMBERS**
Emission characteristics of a section of the combustion chamber of a gas-turbine engine with various modifications of the burners p 300 A86-23670
Further applications of the Lucas fan spray fuel injection combustion system
[ASME PAPER 85-IGT-116] p 302 A86-23912

**COMBUSTION EFFICIENCY**
Gas turbine combustion efficiency
[ASME PAPER 85-IGT-121] p 302 A86-23917
An analytical method of the characteristics of the turbofan engine components p 304 A86-25201

**COMMAND AND CONTROL**
Situation versus command --- flight information for pilots
[SAE PAPER 841638] p 328 A86-26023

**COMMERCIAL AIRCRAFT**
The effectiveness of various control surfaces in quasi-steady and unsteady flows - Applications
[ONERA, TP NO. 1985-147] p 306 A86-24633
The accuracy problem of airplane development force testing in cryogenic wind tunnels
[AIAA PAPER 86-0776] p 310 A86-24765
The laminar wing - A way for improving the economy of commercial aircraft p 274 A86-25022
Supersonic passenger decade p 288 A86-25848
Affordable safety p 269 A86-25850
Airworthiness aspects of fatigue in helicopters
p 280 A86-26128
T700 - A program designed for early maturity and growth potential p 305 A86-26156
Development testing of integrated avionics systems using dynamic environment simulation
p 330 A86-26166
Features of planned IL-96-300, IL-114 aircraft
p 294 N86-18325
Environmental exposure effects on composite materials for commercial aircraft
[NASA-CR-177929] p 314 N86-18449
Improving commercial aircraft training simulators
p 295 N86-19836

**COMMUNICATION NETWORKS**
Communication with land vehicles and aircraft via satellite p 319 A86-25016

**COMPLEX SYSTEMS**
A stable discrete-time adaptive observer applied to multivariable aircraft p 305 A86-23346

**COMPONENT RELIABILITY**
The relationship of ultrafine filtration and oil debris monitoring for helicopter propulsion systems
p 305 A86-26154
Acoustic guide for noise transmission testing of aircraft
[NASA-CASE-LAR-13111-1-CU] p 332 N86-20086

**COMPOSITE MATERIALS**
Current concepts of composite applications in aircraft and engines p 312 A86-23690
A numerical analysis of singuler stress fields at the free edge of layered composites
[ONERA, TP NO. 1985-154] p 313 A86-24636
Interlaminar fracture of composites
p 313 A86-24986
Composites in the development of Agusta helicopters
p 320 A86-26121
Environmental exposure effects on composite materials for commercial aircraft
[NASA-CR-177929] p 314 N86-18449
Ultrasonic f-scan inspection of composite materials
[AD-A159974] p 314 N86-18451

**COMPOSITE STRUCTURES**
High-temperature composite ducts
[SME PAPER MF85-501] p 319 A86-24663
Robotic applications to automated composite aircraft component manufacturing
[SME PAPER MF85-506] p 319 A86-24667

Investigation on a small scale model of ducted composite counterrotating rotor p 289 A86-26119

ARALL - A light weight structural material for impact and fatigue sensitive structures p 313 A86-26158

Correlation of results of an OH-58A helicopter composite tail boom test with a finite element model [AD-A161062] p 295 N86-19316

**COMPRESSIBILITY EFFECTS**

The effect of compressibility on slender vortices p 317 A86-23944

**COMPRESSIBLE FLOW**

Compressibility corrections for multifoil sections p 270 A86-23193

The effect of compressibility on slender vortices p 317 A86-23944

Solution of the Navier-Stokes equations in a compressible fluid by an implicit method [ONERA, TP NO. 1985-148] p 272 A86-24634

Compressible, unsteady lifting-surface theory for a helicopter rotor in forward flight [NASA-TP-2503] p 277 N86-18289

**COMPRESSOR BLADES**

A survey of accelerated vibratory fatigue test method of aero-engine compressor blade [ASME PAPER 85-IGT-105] p 317 A86-23904

Excitation of blade vibration by flow induced acoustic resonances in axial-flow compressors p 303 A86-24712

**COMPRESSOR EFFICIENCY**

Performance computation of turbofan and turbojet engines in off-design conditions [F+W-FO-1746] p 305 N86-19323

**COMPRESSORS**

The development of a second-generation of Controlled Diffusion Airfoils for multistage compressors [ASME PAPER 85-IGT-9] p 271 A86-23830

A cost-effective performance development of the PT6A-65 turboprop compressor [ASME PAPER 85-IGT-41] p 301 A86-23853

An analytical method of the characteristics of the turbofan engine components p 304 A86-25201

**COMPUTATION**

Partitioning and packing mathematical simulation models for calculation on parallel computers [NASA-TM-87170] p 330 N86-19008

**COMPUTATIONAL FLUID DYNAMICS**

Numerical simulation of leading-edge vortex flows p 270 A86-23133

New aspects of the small-perturbation method in aerodynamics p 271 A86-23770

Practical difficulties in the theoretical design of low-speed profiles p 271 A86-23775

Development of numerical methods of external high-speed aerodynamics p 271 A86-23777

The effect of compressibility on slender vortices p 317 A86-23944

A viscous-inviscid interaction model for transonic unsteady flow [ONERA, TP NO. 1985-152] p 272 A86-24630

Solution of the Navier-Stokes equations in a compressible fluid by an implicit method [ONERA, TP NO. 1985-148] p 272 A86-24634

Future requirements of wind tunnels for CFD code verification [AIAA PAPER 86-0753] p 309 A86-24742

Navier-Stokes solutions using finite volume procedures p 274 A86-25005

Navier-Stokes procedure for simulating two-dimensional and quasi-two-dimensional cascade flow p 274 A86-25006

Recent computational fluid dynamics works about high angle of attack aerodynamics with separation vortex p 274 A86-25206

Two-dimensional scheme 'DLM-C' to examine subsonic unsteady lifting surface schemes for finite span p 275 A86-25239

Test cases for the plane potential flow past multi-element aerofoils p 275 A86-25670

A consistent mathematical model to simulate steady and unsteady rotor-blade aerodynamics p 276 A86-26108

**COMPUTER AIDED DESIGN**

Cockpit automation technology p 326 A86-23724

Practical difficulties in the theoretical design of low-speed profiles p 271 A86-23775

Convergence of performance calculation of twin spool turbojet and turbofan [ASME PAPER 85-IGT-82] p 302 A86-23883

Computer-aided 'somatography' for the ergonomic design of the ATTAS experimental cockpit --- Advanced Technologies Testing Aircraft System p 287 A86-25024

Figures of out surface of an airplane model p 288 A86-25237

Flight deck design methodology using computerized anthropometric models [SAE PAPER 841472] p 326 A86-26003

The development and application of finite element stress analysis techniques at Westland Helicopters Ltd p 330 A86-26118

Applications of numerical optimization methods to helicopter design problems - A survey p 290 A86-26120

An introduction to the application of Computer Aided Design (CAD) to the predesign of aircraft and the design of aircraft structures at the Aerospace Section [VTH-M-512] p 330 N86-19045

**COMPUTER GRAPHICS**

Advanced medium scale real-time system --- for evaluation of flight tests p 296 A86-22720

A study of state of the art computer graphics systems for flight safety monitoring p 329 A86-23264

On the longest chord of the first Muller profile [VTH-M-486] p 277 N86-18303

Horizontal display for vertical flight: A direction of motion experiment [AD-A161113] p 299 N86-19321

**COMPUTER PROGRAMMING**

Applications of numerical optimization methods to helicopter design problems - A survey p 290 A86-26120

Experimental and theoretical study of incompressible flow around a wing profile with a spoiler. Contributions of laser velocimetry and the Dvorak method [ISL-R-116/84] p 279 N86-19297

**COMPUTER PROGRAMS**

An approach to developing specification measures p 330 N86-19968

**COMPUTER TECHNIQUES**

Applications of expert systems p 330 N86-19634

**COMPUTERIZED SIMULATION**

Environmental control system simulation using EASY5, as applied to the F-14 [SAE PAPER 851318] p 285 A86-23508

Simulation of the vibration transmission path and the use of a mathematical model of vibration transmission for the vibrational diagnostics of an aircraft engine p 301 A86-23754

Future requirements of wind tunnels for CFD code verification [AIAA PAPER 86-0753] p 309 A86-24742

Electronic display of powerplant parameters [SAE PAPER 841467] p 298 A86-26010

Calculation of helicopter airfoil characteristics for high tip-speed applications [AD-A160694] p 277 N86-18294

Parametric determination of lift interference for three-dimensional models in the Emmen (Switzerland) aircraft works wind tunnel [F+W-FO-1740] p 277 N86-18304

Partitioning and packing mathematical simulation models for calculation on parallel computers [NASA-TM-87170] p 330 N86-19008

Mellin-Fourier correlation [AD-A159685] p 330 N86-20006

**CONCENTRATORS**

Elements of the aerodynamic theory of cyclogyro wing systems with concentrator effects [VTH-LR-338] p 279 N86-19294

**CONCORDE AIRCRAFT**

Supersonic passenger decade p 288 A86-25848

**CONFERENCES**

Institute of Environmental Sciences, Annual Technical Meeting, 31st, Las Vegas, NV, April 30-May 2, 1985, Proceedings p 314 A86-23001

Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings p 284 A86-23252

Dynamic systems: Modelling and control; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 329 A86-23343

Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers p 309 A86-24726

**CONFORMAL MAPPING**

The conformal representation of the NACA 642A015 profile [VTH-M-502] p 277 N86-18296

On the longest chord of the first Muller profile [VTH-M-486] p 277 N86-18303

**CONFUSION**

Performance of resonant radar target identification algorithms using intra-class weighting functions p 321 N86-19490

**CONGRESSIONAL REPORTS**

High speed aeronautics [GPO-51-341] p 278 N86-19284

**CONICAL NOZZLES**

Longitudinal potential distribution in a jet of an ionized gas p 331 A86-23674

**CONSTRAINTS**

General aviation crashworthiness project, phase 3: Acceleration loads and velocity changes of survivable general aviation accidents [NTSB/SR-85/02] p 280 N86-18306

**CONTAMINATION**

Institute of Environmental Sciences, Annual Technical Meeting, 31st, Las Vegas, NV, April 30-May 2, 1985, Proceedings p 314 A86-23001

**CONTROL CONFIGURED VEHICLES**

Sensor system concept for future fighter and strike aircraft p 297 A86-24583

Trends of active control technology p 307 A86-25213

**CONTROL EQUIPMENT**

Low cost thermal control for flight test laser radar [SAE PAPER 851321] p 285 A86-23511

The measuring and control units of airborne recording systems p 297 A86-23763

**CONTROL SIMULATION**

Dynamic systems: Modelling and control; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 329 A86-23343

Environmental control system simulation using EASY5, as applied to the F-14 [SAE PAPER 851318] p 285 A86-23508

Method of spare parts - Digital simulation of aircraft turbine engine control system [ASME PAPER 85-IGT-52] p 301 A86-23858

Simulation concepts and testing of the tail rotor fly-by-wire system of the A129 helicopter p 292 A86-26165

**CONTROL STABILITY**

A stable discrete-time adaptive observer applied to multivariable aircraft p 305 A86-23346

**CONTROL SURFACES**

The effectiveness of various control surfaces in quasi-steady and unsteady flows - Applications [ONERA, TP NO. 1985-147] p 306 A86-24633

Resonance fatigue test of the empennage of a CT4 aircraft [AD-A160749] p 294 N86-18321

**CONTROL SYSTEMS DESIGN**

Dynamic systems: Modelling and control; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 329 A86-23343

Digital controlled closed loop air cycle development --- for military aircraft [SAE PAPER 851319] p 285 A86-23509

The new environmental control system for the B-52 G/H aircraft [SAE PAPER 851320] p 285 A86-23510

Computer controlled variable pressure reducing/shut-off valve for aircraft ECS [SAE PAPER 851360] p 285 A86-23545

Discussion about dynamic simulation test of an aero-engine control system [ASME PAPER 85-IGT-30] p 308 A86-23845

Dynamics and controls flight testing of the X-29A airplane [NASA-TM-86803] p 295 N86-19313

Flight test of a resident backup software system [NASA-TM-86807] p 307 N86-19325

**CONTROL THEORY**

Dynamic systems: Modelling and control; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 329 A86-23343

Optimal control change of state of aircraft turbine engine [ASME PAPER 85-IGT-53] p 301 A86-23859

**CONTROL VALVES**

Modular air shut-off valve [AD-D011935] p 321 N86-18728

**CONTROLLERS**

Modular air shut-off valve [AD-D011935] p 321 N86-18728

Comparison of pilot effective time delay for cockpit controllers used on space shuttle and conventional aircraft [NASA-TM-86030] p 307 N86-19324

**CONVECTIVE FLOW**

Calculation of the heating of a liquid component partially filling a container p 316 A86-23653

**CONVECTIVE HEAT TRANSFER**

Calculation of the heating of a liquid component partially filling a container p 316 A86-23653

**CORROSION PREVENTION**

Corrosion protection of helicopters through organic coatings p 313 A86-26159

**COSMIC RAY SHOWERS**

Analysis of gamma ray families and jets up to 10 to the 7th GeV obtained during 1000 hours exposure of emulsion chambers on the Concorde p 333 A86-22863

**COST ANALYSIS**
State of the art in aircraft gas turbine technology
[ASME PAPER 85-IGT-87] p 302 A86-23888
**COST EFFECTIVENESS**
A cost-effective performance development of the PT6A-65 turboprop compressor
[ASME PAPER 85-IGT-41] p 301 A86-23853
Status and capabilities of sonic boom simulators
[NASA-TM-87664] p 332 N86-20088
**COST REDUCTION**
Energy saving in aircraft p 288 A86-25188
**COUNTER ROTATION**
Investigation on a small scale model of ducted composite counterrotating rotor p 289 A86-26119
**COUPLING**
Effects of blade-to-blade dissimilarities on rotor-body lead-lag dynamics
[AD-A160497] p 293 N86-18317
**CRACK GEOMETRY**
A study of the service life of fail-safe airframe structures on the basis of routine inspections and crack size assessment p 286 A86-23769
**CRACK INITIATION**
Growth of cracks under constant amplitude fatigue loading: Example calculations
[ESDU-84001] p 322 N86-19642
**CRACK PROPAGATION**
In situ methods for crack detection in the master connecting rods of M 462 RF aircraft engines
p 316 A86-23755
Effectiveness of fatigue life enhancing fasteners in the design and rework of aircraft structures
[AD-A159676] p 293 N86-18316
Interactive effects of high- and low-frequency loading on fatigue
[AD-A160601] p 293 N86-18318
Growth of cracks under constant amplitude fatigue loading: Example calculations
[ESDU-84001] p 322 N86-19642
Fatigue crack propagation under spectrum loading
[NAL-TM-MT-8502] p 322 N86-19656
**CRASHWORTHINESS**
General aviation crashworthiness project, phase 3: Acceleration loads and velocity changes of survivable general aviation accidents
[NTSB/SR-85/02] p 280 N86-18306
**CREW EXPERIMENT STATIONS**
Cockpit automation technology p 326 A86-23724
**CREW WORKSTATIONS**
A study of programmable switch symbology --- for cockpits p 329 A86-23708
**CRITICAL VELOCITY**
Nonlinear analysis for dynamic behaviours of a coupled rotational vibration system near its critical speed
p 291 A86-26143
**CROSS CORRELATION**
Mellin-Fourier correlation
[AD-A159685] p 330 N86-20006
**CROSS COUPLING**
Control of aeroelastic instabilities through stiffness cross-coupling p 284 A86-23192
**CRUISE MISSILES**
Low cost thermal control for flight test laser radar
[SAE PAPER 851321] p 285 A86-23511
**CRUISING FLIGHT**
Noise levels in cockpits of aircraft during normal cruise and considerations of auditory risk p 326 A86-25651
**CRYOGENIC WIND TUNNELS**
The accuracy problem of airplane development force testing in cryogenic wind tunnels
[AIAA PAPER 86-0776] p 310 A86-24765
**CRYSTALLIZATION**
Nucleation of ice crystals in supercooled clouds caused by passage of an airplane p 323 A86-26175
**CUSHIONS**
Effect of seat cushions of human respone to +Gz impact p 326 A86-25652

## D

**DAMAGE**
Effectiveness of fatigue life enhancing fasteners in the design and rework of aircraft structures
[AD-A159676] p 293 N86-18316
**DAST PROGRAM**
Ground vibration test results for Drones for Aerodynamic and Structural Testing (DAST)/Aeroelastic Research Wing (ARW-1R) aircraft
[NASA-TM-85906] p 294 N86-19312
**DATA ACQUISITION**
Advanced medium scale real-time system --- for evaluation of flight tests p 296 A86-22720
Further development in stores separation data acquisition and reduction p 315 A86-23262
Flight test data acquisition and processing system
p 329 A86-23263
Air Force Flight Test Instrumentation System - An introduction for flight test engineers and managers
p 296 A86-23275
A review of RAE experimental techniques for rotor dynamics and aerodynamics p 292 A86-26161
Catalog of air weather service technical documents
[AD-A159881] p 324 N86-18912
Hover and forward flight acoustics and performance of a small-scale helicopter rotor system
[NASA-TM-88584] p 295 N86-19314
**DATA BASES**
An electronic index of articles pertaining to Air Force transportation in the post-World War 2 era, with abstracts of selected articles
[AD-A160837] p 281 N86-18308
Hover and forward flight acoustics and performance of a small-scale helicopter rotor system
[NASA-TM-88584] p 295 N86-19314
**DATA PROCESSING**
Flight test data acquisition and processing system
p 329 A86-23263
Signal processing in the airborne receiver of the Interscan microwave landing system
p 282 N86-19303
**DATA RECORDERS**
Use of video cassette recorders for combined video and PCM data recording p 315 A86-23256
**DATA REDUCTION**
Further development in stores separation data acquisition and reduction p 315 A86-23262
**DATA TRANSMISSION**
The data transmission and processing equipment of a high-precision trajectory measurement system
p 296 A86-22728
**DECISION MAKING**
Flight deck automation decisions
[SAE PAPER 841471] p 326 A86-26002
AI applications to military pilot decision aiding - A perspective on transition
[SAE PAPER 841533] p 327 A86-26004
Automation in the cockpit - Who's in charge?
[SAE PAPER 841534] p 327 A86-26005
**DECISIONS**
The decision to fly --- by aircraft pilots
[SAE PAPER 841613] p 328 A86-26024
**DEICING**
HC-Mk1 (Chinook) heated rotor blade icing test. I - Test vehicle, test site, approach and summary of testing
p 293 A86-26167
HC-Mk1 (Chinook) heated rotor blade icing test. II - Analysis of atomospheric conditions, aircraft and systems characteristics p 293 A86-26168
**DELAMINATING**
Interlaminar fracture of composites
p 313 A86-24986
**DELTA WINGS**
Numerical simulation of leading-edge vortex flows
p 270 A86-23133
Review of theory of vortex separated from a leading edge of a delta wing p 275 A86-25207
On the separated flow over a delta wing at high subsonic and transonic speeds
[VTH-M-527] p 279 N86-19293
**DEMAGNETIZATION**
Locating and demagnetizing magnetized aircraft components following a lightning stroke
p 286 A86-23767
**DEPOSITS**
Fuel deposit characteristics at low velocity
[ASME PAPER 85-IGT-130] p 313 A86-23922
**DESIGN ANALYSIS**
Aircraft fuel pump design p 300 A86-23350
The viscoelastic damping technology design guide for aerospace structures
[ASME PAPER 85-DET-104] p 318 A86-24230
Aerodynamic performance of two fifteen-percent-scale wind-tunnel drive fan designs
[AIAA PAPER 86-0734] p 273 A86-24729
Applications of numerical optimization methods to helicopter design problems - A survey
p 290 A86-26120
**DESTRUCTIVE TESTS**
Fiber-reinforced plastic composites for energy absorption purposes p 312 A86-23823
**DETECTION**
In-flight turbulence detection
[AD-A160380] p 325 N86-18923
High dynamic GPS receiver validation demonstration
[NASA-CR-176530] p 283 N86-19306
**DIFFUSERS**
Aerodynamic research on straight wall annular diffuser for turbofan augmentor
[ASME PAPER 85-IGT-16] p 271 A86-23834
**DIFFUSION WELDING**
Fundamental investigation on the impact strength of hollow fan blades
[NAL-TR-879] p 322 N86-19657
**DIGITAL DATA**
Signal processing in the airborne receiver of the Interscan microwave landing system
p 282 N86-19303
**DIGITAL NAVIGATION**
Effects of digital altimetry on pilot workload
[SAE PAPER 841489] p 327 A86-26019
**DIGITAL SIMULATION**
Method of spare parts - Digital simulation of aircraft turbine engine control system
[ASME PAPER 85-IGT-52] p 301 A86-23858
**DIGITAL SYSTEMS**
A flight evaluation of a digital electronic engine control
p 299 A86-23273
**DIGITAL TECHNIQUES**
Unscreened part reliability rivals that of screened parts in new digital avionics p 315 A86-23015
**DIGITALIS**
Effects of digital altimetry on pilot workload
[SAE PAPER 841489] p 327 A86-26019
**DIRECTIONAL CONTROL**
Problems in rudder design for small transport aircraft
p 306 A86-23781
**DIRECTIONAL STABILITY**
Control of aeroelastic instabilities through stiffness cross-coupling p 284 A86-23192
**DISPLACEMENT**
A theory of large and finite displacements of bars
p 316 A86-23662
**DISPLAY DEVICES**
Advanced medium scale real-time system --- for evaluation of flight tests p 296 A86-22720
A study of state of the art computer graphics systems for flight safety monitoring p 329 A86-23264
A preliminary flight evaluation of the peripheral vision display using the NT-33A aircraft p 297 A86-23729
Flight deck displays for managing wind shear encounters
[SAE PAPER 841465] p 298 A86-26008
Effect of vibration on the readability of color CRT displays
[SAE PAPER 841466] p 327 A86-26009
Electronic display of powerplant parameters
[SAE PAPER 841467] p 298 A86-26010
Presentation of information on multimode displays - Abnormal and emergency aircraft operations
[SAE PAPER 841494] p 298 A86-26012
CRT displays in modern helicopter data presentation
p 299 A86-26129
The effects of vocal versus manual response modalities on multi-task performance
[AD-A159830] p 321 N86-18588
Horizontal display for vertical flight: A direction of motion experiment
[AD-A161113] p 299 N86-19321
**DISTANCE**
Effects of measurement errors on estimation of the probability of vertical overlap p 280 A86-25214
**DISTORTION**
Experimental study of the effects on the turbofan engine by the distortion p 304 A86-25192
**DISTRIBUTED PROCESSING**
Distributed sensor networks
[AD-A160596] p 332 N86-19136
**DISTRIBUTION (PROPERTY)**
Experimental study of the acoustic fields far and near a Microturbo TRS 18 turboreactor
[ISL-R-113/84] p 333 N86-20095
**DOPPLER EFFECT**
In-flight turbulence detection
[AD-A160380] p 325 N86-18923
Joint agency turbulence experiment
[AD-A160420] p 325 N86-18924
**DOPPLER NAVIGATION**
U.S. Army helicopter voice technology applications
[SAE PAPER 841609] p 328 A86-26028
**DOPPLER RADAR**
Airborne radar. I - Air-to-surface p 296 A86-23293
In-flight turbulence detection
[AD-A160380] p 325 N86-18923
Joint agency turbulence experiment
[AD-A160420] p 325 N86-18924
**DORNIER AIRCRAFT**
D-CALM - New research aircraft for remote sensing
p 287 A86-25020
**DRAG REDUCTION**
The laminar wing - A way for improving the economy of commercial aircraft p 274 A86-25022

**DRONE VEHICLES**
Ground vibration test results for Drones for Aerodynamic and Structural Testing (DAST)/Aeroelastic Research Wing (ARW-1R) aircraft
[NASA-TM-85906] p 294 N86-19312
**DROP SIZE**
Aircraft flow effects on cloud drop images and concentrations measured by the NAE Twin Otter p 322 A86-23289
Some microphysical processes affecting aircraft icing
[AD-A160375] p 325 N86-18921
**DUCTED FLOW**
Compressibility corrections for multifoil sections p 270 A86-23193
A quick method for estimating heat transfer to a coolant p 316 A86-23666
**DUCTS**
High-temperature composite ducts
[SME PAPER MF85-501] p 319 A86-24663
**DYNAMIC CHARACTERISTICS**
Effects of blade-to-blade dissimilarities on rotor-body lead-lag dynamics
[AD-A160497] p 293 N86-18317
**DYNAMIC MODELS**
Dynamic systems: Modelling and control; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 329 A86-23343
A nonlinear model of aeroelastic behaviour of rotor blades in forward flight p 290 A86-26139
**DYNAMIC RESPONSE**
Dynamic response of windturbine to yawed wind p 323 A86-26140
Microburst wind shear models from the Joint Airport Weather Studies (JAWS)
[AD-A159758] p 324 N86-18910
**DYNAMIC STRUCTURAL ANALYSIS**
Rotorcraft structural dynamic design modifications p 289 A86-26117
Nonlinear analysis for dynamic behaviours of a coupled rotational vibration system near its critical speed p 291 A86-26143
**DYNAMIC TESTS**
Dynamic support interference in high alpha testing --- of aircraft models
[AIAA PAPER 86-0760] p 309 A86-24746
Correlation of results of an OH-58A helicopter composite tail boom test with a finite element model
[AD-A161062] p 295 N86-19316
**DYNAMICAL SYSTEMS**
Dynamic systems: Modelling and control; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 329 A86-23343
Optimization of stepped input signals in the frequency domain for parametric identification p 329 A86-24586

## E

**EAR PROTECTORS**
Noise levels in cockpits of aircraft during normal cruise and considerations of auditory risk p 326 A86-25651
**EARTH ORBITS**
Analytical evaluations of accuracy in determining and predicting parameters of artificial Earth satellite motion using altimeter measurement data p 312 N86-20196
**ECONOMIC ANALYSIS**
The world aircraft industry --- Book p 269 A86-26114
**EDUCATION**
Aircraft design at Kingston Polytechnic p 333 A86-25090
**EFFICIENCY**
An experimental investigation of propeller wakes using a laser Doppler velocimeter p 277 N86-19283
**ELASTIC BARS**
A theory of large and finite displacements of bars p 316 A86-23662
**ELASTOMERS**
Elastomeric rod end bearings - A solution for improving reliability and maintainability p 320 A86-26125
**ELASTOPLASTICITY**
The solution of the thermal elastic-plastic problem of turbine disk by the incremental finite element method
[ASME PAPER 85-IGT-112] p 317 A86-23909
**ELECTRIC BATTERIES**
Development of autonomous power system testbed p 311 A86-24841
**ELECTRIC POWER SUPPLIES**
A new direction in energy conversion - The all-electric aircraft p 319 A86-24830
**ELECTRICAL ENGINEERING**
High dynamic GPS receiver validation demonstration
[NASA-CR-176530] p 283 N86-19306
**ELECTRICAL FAULTS**
Design of the F-16 aircraft electrical system built-in-test monitor p 298 A86-24827
**ELECTRICAL MEASUREMENT**
Prediction and measurement of near fields for antennas on structures p 316 A86-23403
**ELECTROMAGNETIC COMPATIBILITY**
Automated Electromagnetic Compatibility (EMC) testing of Naval aircraft and integrated avionics p 284 A86-23254
**ELECTROMAGNETIC INTERFERENCE**
Antenna siting on helicopters p 282 A86-26133
**ELECTROMAGNETIC NOISE**
In-flight turbulence detection
[AD-A160380] p 325 N86-18923
**ELECTRONIC CONTROL**
A flight evaluation of a digital electronic engine control p 299 A86-23273
Digital control for engine bleed air
[SAE PAPER 851316] p 300 A86-23506
Computer controlled variable pressure reducing/shut-off valve for aircraft ECS
[SAE PAPER 851360] p 285 A86-23545
**ELECTRONIC COUNTERMEASURES**
High dynamic GPS receiver validation demonstration
[NASA-CR-176530] p 283 N86-19306
**ELECTRONIC EQUIPMENT**
Evolution of emerging environmental testing and evaluation techniques p 315 A86-23011
Electronic display of powerplant parameters
[SAE PAPER 841467] p 298 A86-26010
CRT displays in modern helicopter data presentation p 299 A86-26129
A comparative evaluation of the reliability improvement in line replaceable units warranted under the F-16 reliability improvement warranty
[AD-A160830] p 321 N86-18630
High dynamic GPS receiver validation demonstration
[NASA-CR-176530] p 283 N86-19306
**ELECTRONIC EQUIPMENT TESTS**
Automated Electromagnetic Compatibility (EMC) testing of Naval aircraft and integrated avionics p 284 A86-23254
Design of the F-16 aircraft electrical system built-in-test monitor p 298 A86-24827
**EMERGENCIES**
Presentation of information on multimode displays - Abnormal and emergency aircraft operations
[SAE PAPER 841494] p 298 A86-26012
**ENERGY ABSORPTION**
Fiber-reinforced plastic composites for energy absorption purposes p 312 A86-23823
General aviation crashworthiness project, phase 3: Acceleration loads and velocity changes of survivable general aviation accidents
[NTSB/SR-85/02] p 280 N86-18306
**ENERGY POLICY**
Design method for the calculation of performances and flap movement of flexible wind turbine blades
[VTH-M-453] p 323 N86-18795
**ENERGY SPECTRA**
Analysis of gamma ray families and jets up to 10 to the 7th GeV obtained during 1000 hours exposure of emulsion chambers on the Concorde p 333 A86-22863
Joint agency turbulence experiment
[AD-A160420] p 325 N86-18924
**ENERGY STORAGE**
Electric power management and distribution for air and space applications p 319 A86-24828
**ENGINE AIRFRAME INTEGRATION**
Engine/airframe health and usage monitoring an alternate approach via advanced vibration monitoring systems p 296 A86-23255
**ENGINE CONTROL**
A new high temperature silicon on sapphire transducer for jet engine control applications p 315 A86-23266
Digital control for engine bleed air
[SAE PAPER 851316] p 300 A86-23506
Discussion about dynamic simulation test of an aero-engine control system
[ASME PAPER 85-IGT-30] p 3[illegible]9 A86-23845
Method of spare parts - Digital simulation of aircraft turbine engine control system
[ASME PAPER 85-IGT-52] p 301 A86-23858
**ENGINE COOLANTS**
A quick method for estimating heat transfer to a coolant p 316 A86-23666
**ENGINE DESIGN**
Convergence of performance calculation of twin spool turbojet and turbofan
[ASME PAPER 85-IGT-82] p 302 A86-23883
Rapid calculation of engine performance
[ASME PAPER 85-IGT-83] p 302 A86-23884
Development of a new technology small fan jet engine
[ASME PAPER 85-IGT-139] p 303 A86-23931
Propeller design point calculation method for comparing turbofan/propfan engine performance
[ASME PAPER 85-IGT-150] p 303 A86-23941
The prop-fan introduces a new engine generation p 304 A86-25021
Research and development of FJR 710 turbo fan engine - Second phase p 304 A86-25177
Flat rating concept introduced in the GTX engine p 304 A86-26071
T700 - A program designed for early maturity and growth potential p 305 A86-26156
**ENGINE FAILURE**
Investigation into the cause of failure of a turboprop impeller in service
[ASME PAPER 85-IGT-147] p 303 A86-23938
**ENGINE INLETS**
The effect of the velocity profile at the diffuser inlet on the flow pattern p 300 A86-23664
An experimental investigation of response of a turbojet engine to inlet distortion
[ASME PAPER 85-IGT-12] p 301 A86-23832
Research on sonic inlet p 331 A86-25217
A study of ramjet engine. III - Air inlet performance as the engine component p 304 A86-25234
**ENGINE MONITORING INSTRUMENTS**
Engine/airframe health and usage monitoring an alternate approach via advanced vibration monitoring systems p 296 A86-23255
Flight test data acquisition and processing system p 329 A86-23263
A new high temperature silicon on sapphire transducer for jet engine control applications p 315 A86-23266
Diagnostic methods for gas-turbine aircraft powerplants p 300 A86-23751
Electronic display of powerplant parameters
[SAE PAPER 841467] p 298 A86-26010
The health and usage monitoring system of the Westland 30 series 300 helicopter p 299 A86-26153
**ENGINE NOISE**
Sound generation by an energetically inhomogeneous gas flow in a gas-turbine aircraft engine p 300 A86-23753
Research on sonic inlet p 331 A86-25217
Current wind tunnel capability and planned improvements at Lewis Research Center
[NASA-TM-87190] p 311 N86-18329
High velocity gas jet noise control p 331 N86-19123
**ENGINE PARTS**
The finite element stress analysis for solid-shell combined parts in aeroengines
[ASME PAPER 85-IGT-72] p 317 A86-23873
Interactive effects of high- and low-frequency loading on fatigue
[AD-A160601] p 293 N86-18318
Aeronautical facilities catalogue. Volume 2: Airbreathing propulsion and flight simulators
[NASA-RP-1133] p 311 N86-18328
**ENGINE TESTS**
Diagnostic methods for gas-turbine aircraft powerplants p 300 A86-23751
Determination of diagnostic parameters for the in situ diagnostics of the air-gas path of the AI-25TL engine p 300 A86-23752
In situ methods for crack detection in the master connecting rods of M 462 RF aircraft engines p 316 A86-23755
A holographic study of the vibrational modes of aircraft engine rotors p 301 A86-23756
Using wear products for assessing and predicting the condition of aircraft jet engines p 316 A86-23759
Development of a new technology small fan jet engine
[ASME PAPER 85-IGT-139] p 303 A86-23931
Research and development of FJR 710 turbo fan engine - Second phase p 304 A86-25177
A world review on air breathing engine altitude test facilities p 310 A86-25197
Tests on whole A129 engine bay simulating the inertia and aerodynamic loads p 292 A86-26164
Aeronautical facilities catalogue. Volume 2: Airbreathing propulsion and flight simulators
[NASA-RP-1133] p 311 N86-18328
**ENGINEERING MANAGEMENT**
Application of mathematical optimization procedures to a structural model of a large finite-element wing
[NASA-TM-87597] p 322 N86-19661
**ENVIRONMENTAL CHEMISTRY**
Environmental exposure effects on composite materials for commercial aircraft
[NASA-CR-177929] p 314 N86-18449
**ENVIRONMENTAL CONTROL**
Environmental control system simulation using EASY5, as applied to the F-14
[SAE PAPER 851318] p 285 A86-23508
Digital controlled closed loop air cycle development --- for military aircraft
[SAE PAPER 851319] p 285 A86-23509

The new environmental control system for the B-52 G/H aircraft
[SAE PAPER 851320] p 285 A86-23510

**ENVIRONMENTAL MONITORING**
Aircraft measurements and coordination in FASINEX
[AD-A160789] p 321 N86-18699

**ENVIRONMENTAL SURVEYS**
International Civil Aviation Organization Helicopter Noise Measurement Repeatability Program: US test report, Bell 206L-1, noise measurement flight test
[AD-A159898] p 333 N86-20090

**ENVIRONMENTAL TESTS**
Institute of Environmental Sciences, Annual Technical Meeting, 31st, Las Vegas, NV, April 30-May 2, 1985, Proceedings p 314 A86-23001
Evolution of emerging environmental testing and evaluation techniques p 315 A86-23011

**EPOXY COMPOUNDS**
Ultrasonic I-scan inspection of composite materials
[AD-A159974] p 314 N86-18451

**EPOXY RESINS**
Ultrasonic I-scan inspection of composite materials
[AD-A159974] p 314 N86-18451

**EQUATIONS OF MOTION**
Proposal for the choice of state variables for equations of motion of aircraft in moving air p 306 A86-24588

**EQUATIONS OF STATE**
Optimal control change of state of aircraft turbine engine
[ASME PAPER 85-IGT-53] p 301 A86-23859

**ERROR ANALYSIS**
A class of airfoils having finite trailing-edge pressure gradients p 270 A86-23184
Aerodynamic performance of two fifteen-percent-scale wind-tunnel drive fan designs
[AIAA PAPER 86-0734] p 273 A86-24729
Signal processing in the airborne receiver of the Interscan microwave landing system
p 282 N86-19303

**EULER EQUATIONS OF MOTION**
On the separated flow over a delta wing at high subsonic and transonic speeds
[VTH-M-527] p 279 N86-19293

**EVALUATION**
Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed
[AD-A160862] p 294 N86-18322
A comparative evaluation of the reliability improvement in line replaceable units warranted under the F-16 reliability improvement warranty
[AD-A160830] p 321 N86-18630

**EXHAUST EMISSION**
Emission characteristics of a section of the combustion chamber of a gas-turbine engine with various modifications of the burners p 300 A86-23670

**EXPERT SYSTEMS**
Applications of expert systems p 330 N86-19634

**EXTERNAL STORE SEPARATION**
Further development in stores separation data acquisition and reduction p 315 A86-23262

**EXTERNAL TANKS**
Results of high angle-of-attack testing of the F-15 with conformal fuel tanks p 284 A86-23267

**F**

**F-14 AIRCRAFT**
Environmental control system simulation using EASY5, as applied to the F-14
[SAE PAPER 851318] p 285 A86-23508

**F-15 AIRCRAFT**
Results of high angle-of-attack testing of the F-15 with conformal fuel tanks p 284 A86-23267

**F-16 AIRCRAFT**
The F-16XL flight test program p 284 A86-23260
A flight evaluation of a digital electronic engine control
p 299 A86-23273
Design of the F-16 aircraft electrical system built-in-test monitor p 298 A86-24827
Advanced fighter technology integration (AFTI) F-16 - The pilot interface
[SAE PAPER 841633] p 327 A86-26018
A comparative evaluation of the reliability improvement in line replaceable units warranted under the F-16 reliability improvement warranty
[AD-A160830] p 321 N86-18630

**F-28 TRANSPORT AIRCRAFT**
Determination of performance and stability characteristics from dynamic maneuvers with a transport aircraft using parameter identification techniques
[NLR-MP-84024-U] p 308 N86-19326

**FABRICS**
Aerodynamic performances of fabric surface airfoils
p 275 A86-25224

**FAIL-SAFE SYSTEMS**
A study of the service life of fail-safe airframe structures on the basis of routine inspections and crack size assessment p 296 A86-23769
Winging it in the 1980's - Why guidelines are needed for cockpit automation
[SAE PAPER 841634] p 329 A86-26022
Airworthiness aspects of fatigue in helicopters
p 280 A86-26128

**FAILURE ANALYSIS**
Evolution of emerging environmental testing and evaluation techniques p 315 A86-23011
Unscreened part reliability rivals that of screened parts in new digital avionics p 315 A86-23015
Investigation into the cause of failure of a turboprop impeller in service
[ASME PAPER 85-IGT-147] p 303 A86-23936

**FAN BLADES**
Aerodynamic performance of two fifteen-percent-scale wind-tunnel drive fan designs
[AIAA PAPER 86-0734] p 273 A86-24729
Fundamental investigation on the impact strength of hollow fan blades
[NAL-TR-879] p 322 N86-19657

**FANS**
Further applications of the Lucas fan spray fuel injection combustion system
[ASME PAPER 85-IGT-116] p 302 A86-23912

**FASTENERS**
Effectiveness of fatigue life enhancing fasteners in the design and rework of aircraft structures
[AD-A159676] p 293 N86-18316

**FATIGUE (MATERIALS)**
Airworthiness aspects of fatigue in helicopters
p 280 A86-26128
Interactive effects of high- and low-frequency loading on fatigue
[AD-A160601] p 293 N86-18318
Resonance fatigue test of the empennage of a CT4 aircraft
[AD-A160749] p 294 N86-18321
Growth of cracks under constant amplitude fatigue loading: Example calculations
[ESDU-84001] p 322 N86-19642
Fatigue crack propagation under spectrum loading
[NAL-TM-MT-8502] p 322 N86-19656

**FATIGUE LIFE**
Life prediction for the main shaft of aircraft turbine engine
[ASME PAPER 85-IGT-136] p 303 A86-23928
Airworthiness aspects of fatigue in helicopters
p 280 A86-26126
The relationship of ultrafine filtration and oil debris monitoring for helicopter propulsion systems
p 305 A86-26154
Effectiveness of fatigue life enhancing fasteners in the design and rework of aircraft structures
[AD-A159676] p 293 N86-18316
The test loads sequences applied to the CT4 full scale fatigue test
[AD-A160736] p 294 N86-18320

**FATIGUE TESTS**
A survey of accelerated vibratory fatigue test method of aero-engine compressor blade
[ASME PAPER 85-IGT-105] p 317 A86-23904
Effectiveness of fatigue life enhancing fasteners in the design and rework of aircraft structures
[AD-A159676] p 293 N86-18316
The test loads sequences applied to the CT4 full scale fatigue test
[AD-A160736] p 294 N86-18320
Resonance fatigue test of the empennage of a CT4 aircraft
[AD-A160749] p 294 N86-18321

**FAULT TOLERANCE**
Reliability and structural inspection program for transport aeroplanes p 269 A86-25176
Flight test of a resident backup software system
[NASA-TM-86807] p 307 N86-19325

**FEEDBACK CONTROL**
Digital controlled closed loop air cycle development — for military aircraft
[SAE PAPER 851319] p 285 A86-23509

**FIBER OPTICS**
Optical fibers application to visualization of flow separation inside an aircraft intake in wind tunnel
[ONERA, TP NO. 1985-158] p 309 A86-24638
Study on the digital position transducer with optical time-delay pulse
[NAS-TR-878] p 322 N86-19583

**FIBER REINFORCED COMPOSITES**
Fiber-reinforced plastic composites for energy absorption purposes p 312 A86-23823
Correlation of results of an OH-58A helicopter composite tail boom test with a finite element model
[AD-A161062] p 295 N86-19316

**FIGHTER AIRCRAFT**
Sensor system concept for future fighter and strike aircraft p 297 A86-24583
Optical fibers application to visualization of flow separation inside an aircraft intake in wind tunnel
[ONERA, TP NO. 1985-158] p 309 A86-24638
The role of wind tunnel testing in future aircraft development
[AIAA PAPER 86-075] p 309 A86-24739
Design and development of an inertial power supply unit for carrier-based aircraft p 304 A86-24861
Lavi - Advanced fighter and industrial springboard
p 287 A86-24890
The HUD as a primary flight instrument
[SAE PAPER 841463] p 298 A86-26008
Advanced fighter technology integration (AFTI) F-16 - The pilot interface
[SAE PAPER 841633] p 327 A86-26018
A comparative evaluation of the reliability improvement in line replaceable units warranted under the F-16 reliability improvement warranty
[AD-A160830] p 321 N86-18630
Low-speed wind-tunnel investigation of the effect of strakes and nose machines on lateral-directional stability of a fighter configuration
[NASA-TM-87641] p 278 N86-19287
The role of a real-time flight support facility in flight research programs
[NASA-TM-86805] p 311 N86-19330

**FILTRATION**
The relationship of ultrafine filtration and oil debris monitoring for helicopter propulsion systems
p 305 A86-26154

**FINITE ELEMENT METHOD**
The finite element stress analysis for solid-shell combined parts in aeroengines
[ASME PAPER 85-IGT-72] p 317 A86-23873
The solution of the thermal elastic-plastic problem of turbine disk by the incremental finite element method
[ASME PAPER 85-IGT-112] p 317 A86-23909
The development and application of finite element stress analysis techniques at Westland Helicopters Ltd
p 330 A86-26118
Correlation of results of an OH-58A helicopter composite tail boom test with a finite element model
[AD-A161062] p 295 N86-19316
Application of mathematical optimization procedures to a structural model of a large finite-element wing
[NASA-TM-87597] p 322 N86-19661

**FINITE VOLUME METHOD**
Solution of the Navier-Stokes equations in a compressible fluid by an implicit method
[ONERA, TP NO. 1985-148] p 272 A86-24634
Navier-Stokes solutions using finite volume procedures p 274 A86-25005

**FIREPROOFING**
Tests on whole A129 engine bay simulating the inertia and aerodynamic loads p 292 A86-26164

**FLAME RETARDANTS**
Fire-retardant decorative inks for aircraft interiors
[NASA-TM-88199] p 313 N86-19441

**FLAPPING**
Design method for the calculation of performances and flap movement of flexible wind turbine blades
[VTH-M-453] p 323 N86-18795

**FLIGHT ALTITUDE**
Flight operations noise tests of eight helicopters
[AD-A159836] p 331 N86-19127

**FLIGHT CHARACTERISTICS**
Longitudinal flying qualitites criteria for single-pilot instrument flight operations p 305 A86-23186
The use of analytical methods to assess aircraft maneuverability p 305 A86-23771
Frequency methods of aircraft identification — Russian book p 306 A86-24148
Deep stall characteristics of the MU-300
p 306 A86-25203
The decision to fly — by aircraft pilots
[SAE PAPER 841613] p 328 A86-26024
Aircrew-aircraft integration - A summary of U.S. Army research programs and plans p 310 A86-26149
An approach to developing specification measures
p 330 N86-19068

**FLIGHT CONTROL**
The telemetry system of the DFVLR experimental aircraft ATTAS p 281 A86-22729
The study of adaptive control augmentation system implemented with microcomputer — aircraft flight
p 306 A86-24577
Sensor system concept for future fighter and strike aircraft p 297 A86-24583
Efficiently meeting electric power needs for future aircraft p 319 A86-24829
Trends of active control technology
p 307 A86-25213

Advanced fighter technology integration (AFTI) F-16 - The pilot interface
[SAE PAPER 841633] p 327 A86-26018
Aircrew-aircraft integration - A summary of U.S. Army research programs and plans p 310 A86-26149
An investigation of the use of bandwidth criteria for rotorcraft handling-qualities specifications
[AD-A160864] p 294 N86-18319
Dynamics and controls flight testing of the X-29A airplane
[NASA-TM-86803] p 295 N86-19313
Horizontal display for vertical flight: A direction of motion experiment
[AD-A161113] p 299 N86-19321
Flight test of a resident backup software system
[NASA-TM-86807] p 307 N86-19325

**FLIGHT CREWS**
Wide-angle, low-altitude flight simulator vision system for cockpit research and aircrew training
p 311 A86-26152
B-52G crew noise exposure study
[AD-A161112] p 333 N86-20084

**FLIGHT HAZARDS**
Calculation of ice accretion on cylindrical rods according to Bain's model, and comparison with experimental results --- stratus clouds
[DFVLR-FB-85-46] p 325 N86-18933

**FLIGHT INSTRUMENTS**
The HUD as a primary flight instrument
[SAE PAPER 841483] p 298 A86-26006
CRT displays in modern helicopter data presentation
p 290 A86-26129

**FLIGHT MANAGEMENT SYSTEMS**
Situation versus command --- flight information for pilots
[SAE PAPER 841636] p 328 A86-26023

**FLIGHT MECHANICS**
The telemetry system of the DFVLR experimental aircraft ATTAS p 281 A86-22729
Flight-mechanics problems solvable by a research flight simulator p 308 A86-23773

**FLIGHT OPERATIONS**
Flight operations noise tests of eight helicopters
[AD-A159835] p 331 N86-19127

**FLIGHT OPTIMIZATION**
Optimum helicopter in the flight spectrum
p 290 A86-26123

**FLIGHT PATHS**
Calibration of an on-ground aircraft tracking radar by aerial photogrammetry
[NAL-TR-861] p 282 N86-18311
Flight operations noise tests of eight helicopters
[AD-A159835] p 331 N86-19127

**FLIGHT PLANS**
Flight operations noise tests of eight helicopters
[AD-A159835] p 331 N86-19127

**FLIGHT RECORDERS**
Magnetic tape recording under severe environmental conditions p 314 A86-22716
Airborne diagnostic equipment p 297 A86-23782

**FLIGHT SAFETY**
A study of state of the art computer graphics systems for flight safety monitoring p 329 A86-23264
The utility of Head-Up Displays - Eye-focus vs decision times p 297 A86-23728
Determination of limitations for helicopter ship-borne operations p 280 A86-26151

**FLIGHT SIMULATION**
The telemetry system of the DFVLR experimental aircraft ATTAS p 281 A86-22729
Composite statistical method for modeling wind gusts
p 308 A86-23169
A preliminary flight evaluation of the peripheral vision display using the NT-33A aircraft p 297 A86-23729
Comparison of voice types for helicopter voice warning systems
[SAE PAPER 841611] p 328 A86-26030
Advances in simulation, control and guidance and other systems for manned and unmanned aircraft
p 289 A86-26072
Helicopter active control with blade stall alleviation model capability p 307 A86-26136
Aeronautical facilities catalogue. Volume 2: Airbreathing propulsion and flight simulators
[NASA-RP-1133] p 311 N86-18328
Wind shear investigation program at the NLR
[NLR-MP-84027-U] p 325 N86-19806

**FLIGHT SIMULATORS**
The role of the Flight Test Department in the development of new technology aircraft
p 285 A86-23271
Simulator design features for helicopter landing on small ships p 308 A86-23750
Flight-mechanics problems solvable by a research flight simulator p 308 A86-23773
The development of an advanced helicopter research simulator
[SAE PAPER 841610] p 310 A86-26029
DFVLR helicopter in-flight simulator for flying quality research p 310 A86-26148
Wide-angle, low-altitude flight simulator vision system for cockpit research and aircrew training
p 311 A86-26152
Flight training simulators. Effects of terrain accuracy on simulated radar image quality
[AD-A160905] p 311 N86-18333
Horizontal display for vertical flight: A direction of motion experiment
[AD-A161113] p 299 N86-19321
Improving commercial aircraft training simulators
p 295 N86-19836

**FLIGHT TEST INSTRUMENTS**
Telemetry system prototype development --- for Naval aircraft flight tests p 281 A86-23268

**FLIGHT TESTS**
Advanced medium scale real-time system --- for evaluation of flight tests p 296 A86-22720
The telemetry system of the DFVLR experimental aircraft ATTAS p 281 A86-22729
Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings
p 284 A86-23252
The F-16XL flight test program p 284 A86-23260
Further development in stores separation data acquisition and reduction p 315 A86-23262
Flight test data acquisition and processing system
p 329 A86-23263
A study of state of the art computer graphics systems for flight safety monitoring p 329 A86-23264
Results of high angle-of-attack testing of the F-15 with conformal fuel tanks p 284 A86-23267
The role of the Flight Test Department in the development of new technology aircraft
p 285 A86-23271
Air Force Flight Test Instrumentation System - An introduction for flight test engineers and managers
p 296 A86-23275
Development of a new technology small fan jet engine
[ASME PAPER 85-IGT-139] p 303 A86-23931
Frequency methods of aircraft identification --- Russian book p 306 A86-24148
Future requirements of wind tunnels for CFD code verification
[AIAA PAPER 86-0753] p 309 A86-24742
A review of pilot workload measurement techniques used on the A-10 single seat night attack test program
[SAE PAPER 841492] p 327 A86-26016
DFVLR flying qualities research using operational helicopters p 307 A86-26147
Determination of limitations for helicopter ship-borne operations p 280 A86-26151
Helicopter maneuvre stability - A new twist
p 307 A86-26160
A review of RAE experimental techniques for rotor dynamics and aerodynamics p 292 A86-26161
HC-Mk1 (Chinook) heated rotor blade icing test. I - Test vehicle, test site, approach and summary of testing
p 293 A86-26167
HC-Mk1 (Chinook) heated rotor blade icing test. II - Analysis of atomospheric conditions, aircraft and systems characteristics p 293 A86-26168
Helicopter vibration flight testing - The rotortuner approach p 293 A86-26169
The 737 graphite composite flight spoiler flight service evaluation
[NASA-CR-172600] p 314 N86-18448
Environmental exposure effects on composite materials for commercial aircraft
[NASA-CR-177929] p 314 N86-18449
Aircraft measurements and coordination in FASINEX
[AD-A160769] p 321 N86-18699
Dynamics and controls flight testing of the X-29A airplane
[NASA-TM-86803] p 295 N86-19313
Flight test evaluation of the Netherlands flight inspection aircraft
[NLR-MP-84052-U] p 295 N86-19318
Determination of limitations for helicopter ship-borne operations
[NLR-MP-84072-U] p 295 N86-19319
Flight test of a resident backup software system
[NASA-TM-86807] p 307 N86-19325
Determination of performance and stability characteristics from dynamic maneuvers with a transport aircraft using parameter identification techniques
[NLR-MP-84024-U] p 308 N86-19326
The role of a real-time flight support facility in flight research programs
[NASA-TM-86805] p 311 N86-19330
In-flight acoustic measurements on a light twin-engined turboprop airplane
[NASA-CR-178004] p 332 N86-20089

**FLIGHT TRAINING**
Flight training simulators. Effects of terrain accuracy on simulated radar image quality
[AD-A160905] p 311 N86-18333
Improving commercial aircraft training simulators
p 295 N86-19836

**FLOW DISTORTION**
An experimental investigation of response of a turbojet engine to inlet distortion
[ASME PAPER 85-IGT-12] p 301 A86-23832

**FLOW DISTRIBUTION**
The response of airfoils to periodic disturbances - The unsteady Kutta condition
[AIAA PAPER 84-0050] p 270 A86-23126
Numerical simulation of leading-edge vortex flows
p 270 A86-23133
Longitudinal potential distribution in a jet of an ionized gas p 331 A86-23674
Calculation of helicopter airfoil characteristics for high tip-speed applications
[AD-A160694] p 277 N86-18294
Aerodynamics of two-dimensional blade-vortex interaction
[AD-A160662] p 295 N86-19315

**FLOW GEOMETRY**
The effect of the velocity profile at the diffuser inlet on the flow pattern p 300 A86-23664

**FLOW MEASUREMENT**
The effect of the velocity profile at the diffuser inlet on the flow pattern p 300 A86-23664
Radial distribution circulation of a rotor in hover measured by laser velocimeter p 276 A86-26110
Three component hot-wire measurements in the wake of a rotor model p 320 A86-26111

**FLOW VELOCITY**
Development of numerical methods of external high-speed aerodynamics p 271 A86-23777

**FLOW VISUALIZATION**
Optical fibers application to visualization of flow separation inside an aircraft intake in wind tunnel
[ONERA, TP NO. 1985-156] p 309 A86-24638
An experimental investigation of the parallel blade-vortex interaction p 276 A86-26106

**FLUID DYNAMICS**
Elements of the aerodynamic theory of cyclogyro wing systems with concentrator effects
[VTH-LR-338] p 279 N86-19294

**FLUTTER**
Aerodynamic detuning analysis of an unstalled supersonic turbofan cascade
[ASME PAPER 85-GT-192] p 270 A86-22732
Control of aeroelastic instabilities through stiffness cross-coupling p 284 A86-23192
Prediction of blade flutter in a tuned rotor
[ASME PAPER 85-IGT-100] p 302 A86-23899

**FLUTTER ANALYSIS**
Pressure fluctuations on the external surface of an aircraft p 271 A86-23780
Stall flutter of helicopter blade p 306 A86-25205
Ground vibration test results for Drones for Aerodynamic and Structural Testing (DAST)/Aeroelastic Research Wing (ARW-1R) aircraft
[NASA-TM-85906] p 294 N86-19312

**FLY BY WIRE CONTROL**
A new direction in energy conversion - The all-electric aircraft p 319 A86-24830
Simulation concepts and testing of the tail rotor fly-by-wire system of the A129 helicopter
p 292 A86-26165
Flight test of a resident backup software system
[NASA-TM-86807] p 307 N86-19325

**FOURIER ANALYSIS**
Mellin-Fourier correlation
[AD-A159685] p 330 N86-20006

**FRACTURE MECHANICS**
Evolution of emerging environmental testing and evaluation techniques p 315 A86-23011
Interlaminar fracture of composites
p 313 A86-24986
Growth of cracks under constant amplitude fatigue loading: Example calculations
[ESDU-84001] p 322 N86-19642

**FRACTURE STRENGTH**
Interlaminar fracture of composites
p 313 A86-24986

**FREE CONVECTION**
Calculation of the heating of a liquid component partially filling a container p 316 A86-23653

**FREE JETS**
Aeronautical facilities catalogue. Volume 2: Airbreathing propulsion and flight simulators
[NASA-RP-1133] p 311 N86-18328

**FREEZING**
The aircraft icing environment in wintertime, low ceiling conditions
[AD-A160578] p 280 N86-18307
**FREQUENCY RESPONSE**
Frequency methods of aircraft identification --- Russian book p 306 A86-24148
**FUEL COMBUSTION**
Gas turbine fuels and their influence on combustion --- Book p 312 A86-23274
Further applications of the Lucas fan spray fuel injection combustion system
[ASME PAPER 85-IGT-116] p 302 A86-23912
**FUEL CONSUMPTION**
Design approach for an optimum prop-fan propulsion system
[ASME PAPER 85-IGT-57] p 301 A86-23861
State of the art in aircraft gas turbine technology
[ASME PAPER 85-IGT-87] p 302 A86-23888
Development of a new technology small fan jet engine
[ASME PAPER 85-IGT-139] p 303 A86-23931
Energy saving in aircraft p 288 A86-25188
**FUEL CONTAMINATION**
Fuel deposit characteristics at low velocity
[ASME PAPER 85-IGT-130] p 313 A86-23922
**FUEL INJECTION**
Further applications of the Lucas fan spray fuel injection combustion system
[ASME PAPER 85-IGT-116] p 302 A86-23912
**FUEL PRODUCTION**
The production of jet fuel from alternate sources
[ASME PAPER 85-IGT-67] p 312 A86-23868
**FUEL PUMPS**
Aircraft fuel pump design p 300 A86-23350
**FUEL SPRAYS**
Further applications of the Lucas fan spray fuel injection combustion system
[ASME PAPER 85-IGT-116] p 302 A86-23912
**FUEL TANKS**
Results of high angle-of-attack testing of the F-15 with conformal fuel tanks p 284 A86-23267
Calculation of the heating of a liquid component partially filling a container p 316 A86-23653
**FUEL TESTS**
Test and evaluation of shale derived jet fuel by the United States Air Force
[ASME PAPER 85-IGT-115] p 313 A86-23911
Fuel deposit characteristics at low velocity
[ASME PAPER 85-IGT-130] p 313 A86-23922
**FUEL-AIR RATIO**
Emission characteristics of a section of the combustion chamber of a gas-turbine engine with various modifications of the burners p 300 A86-23670
**FUNCTIONAL INTEGRATION**
Optimal control of integral-functional equations
p 329 A86-23581
**FUSELAGES**
Air flow and particle trajectories around aircraft fuselages. III - Extensions to particles of arbitrary shape
p 316 A86-23281
Recent advances in helicopter aerodynamics
[ONERA, TP NO. 1985-166] p 273 A86-24642
Electrical connections and antenna performance of a large composite fuselage module in the high frequency range p 292 A86-26157
Design and testing of a large scale helicopter fuselage model in the RAE 5 metre pressurized wind tunnel
p 292 A86-26163
Resonance fatigue test of the empennage of a CT4 aircraft
[AD-A160749] p 294 N86-18321

## G

**GAMMA RAY ASTRONOMY**
Analysis of gamma ray families and jets up to 10 to the 7th GeV obtained during 1000 hours exposure of emulsion chambers on the Concorde
p 333 A86-22863
**GAS JETS**
Longitudinal potential distribution in a jet of an ionized gas p 331 A86-23674
**GAS PATH ANALYSIS**
Determination of diagnostic parameters for the in situ diagnostics of the air-gas path of the AI-25TL engine
p 300 A86-23752
**GAS TURBINE ENGINES**
Emission characteristics of a section of the combustion chamber of a gas-turbine engine with various modifications of the burners p 300 A86-23670
Diagnostic methods for gas-turbine aircraft powerplants p 300 A86-23751
Sound generation by an energetically inhomogeneous gas flow in a gas-turbine aircraft engine
p 300 A86-23753
Simulation of the vibration transmission path and the use of a mathematical model of vibration transmission for the vibrational diagnostics of an aircraft engine
p 301 A86-23754
State of the art in aircraft gas turbine technology
[ASME PAPER 85-IGT-87] p 302 A86-23888
The solution of the thermal elastic-plastic problem of turbine disk by the incremental finite element method
[ASME PAPER 85-IGT-112] p 317 A86-23909
Gas turbine combustion efficiency
[ASME PAPER 85-IGT-121] p 302 A86-23917
Life prediction for the main shaft of aircraft turbine engine
[ASME PAPER 85-IGT-136] p 303 A86-23928
The use of lasers in gas turbine manufacturing
[ASME PAPER 85-IGT-141] p 317 A86-23933
Results of recent research on damped fan blades
[ASME PAPER 85-DET-133] p 318 A86-24236
Heat transfer problems in aero-engines
p 272 A86-24470
Fundamental heat transfer research for gas turbine engines NASA workshop overview p 272 A86-24471
Flat rating concept introduced in the GTX engine
p 304 A86-26071
**GASEOUS FUELS**
Gas turbine fuels and their influence on combustion --- Book p 312 A86-23274
**GEARS**
The design of an advanced engineering gearbox
p 320 A86-26155
**GENERAL AVIATION AIRCRAFT**
Longitudinal flying qualitites criteria for single-pilot instrument flight operations p 305 A86-23186
Deep stall characteristics of the MU-300
p 306 A86-25203
Aerodynamic characteristics of general aviation at high angle of attack with the propeller slip stream
p 306 A86-25204
General aviation crashworthiness project, phase 3: Acceleration loads and velocity changes of survivable general aviation accidents
[NTSB/SR-85/02] p 280 N86-18306
Aircraft accident reports: Brief formats, US civil and foreign aviation, issue number 1 of 1984 accidents
[PB85-916920] p 281 N86-18309
Aircraft accident reports: Brief format US Civil and Foreign Aviation, issue 2 of 1984 accidents
[PB85-916921] p 281 N86-18310
Sukhoy design bureau builds sport plane made of plastic p 294 N86-18324
Features of planned IL-96-300, IL-114 aircraft
p 294 N86-18325
**GOVERNMENT/INDUSTRY RELATIONS**
The world aircraft industry --- Book
p 269 A86-26114
**GRAPHITE-EPOXY COMPOSITES**
The 737 graphite composite flight spoiler flight service evaluation
[NASA-CR-172600] p 314 N86-18448
Environmental exposure effects on composite materials for commercial aircraft
[NASA-CR-177929] p 314 N86-18449
Ultrasonic f-scan inspection of composite materials
[AD-A159974] p 314 N86-18451
**GROUND BASED CONTROL**
Calibration of an on-ground aircraft tracking radar by aerial photogrammetry
[NAL-TR-861] p 282 N86-18311
**GROUND EFFECT (AERODYNAMICS)**
Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model
[AIAA PAPER 86-0780] p 286 A86-24759
Hover test of a full-scale hingeless rotor
p 291 A86-26144
**GROUND RESONANCE**
Influence of nonlinear blade damping on helicopter ground resonance instability p 283 A86-23185
Analytical and experimental results of the ground resonance phenomenon for A.129 p 291 A86-26142
**GROUND STATIONS**
Mode-S beacon system to cover all U.S. upper airspace by 1991 p 281 A86-23376
**GROUND TESTS**
The data transmission and processing equipment of a high-precision trajectory measurement system
p 296 A86-22728
Environmental exposure effects on composite materials for commercial aircraft
[NASA-CR-177929] p 314 N86-18449
**GROUND WIND**
Limited Surface Observations Climatic Summary (LISOCS). Parts A, C-F: Bremen International, West Germany
[AD-A159656] p 323 N86-18894
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: General Billy Mitchell Field, Wisconsin
[AD-A159658] p 324 N86-18896
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: Aviano AB, Italy
[AD-A159662] p 324 N86-18900
Giebelstadt ain Germany (West). Limited surface observations climatic summary (LISOCS): Parts A, C-F
[AD-A159664] p 324 N86-18902
**GUSTS**
Composite statistical method for modeling wind gusts
p 308 A86-23189
**GYROSCOPIC STABILITY**
A preliminary flight evaluation of the peripheral vision display using the NT-33A aircraft p 297 A86-23729

## H

**HARBORS**
USSR report: Transportation
[JPRS-UTR-85-015] p 294 N86-18323
**HARNESSES**
General aviation crashworthiness project, phase 3: Acceleration loads and velocity changes of survivable general aviation accidents
[NTSB/SR-85/02] p 280 N86-18306
**HAZARDS**
B-52G crew noise exposure study
[AD-A161112] p 333 N86-20094
**HEAD-UP DISPLAYS**
The utility of Head-Up Displays - Eye-focus vs decision times p 297 A86-23728
The HUD as a primary flight instrument
[SAE PAPER 841463] p 298 A86-26006
Presentation of radar altitude information on the HUD
[SAE PAPER 841464] p 298 A86-26007
**HEAT TRANSFER**
Heat transfer problems in aero-engines
p 272 A86-24470
Fundamental heat transfer research for gas turbine engines NASA workshop overview p 272 A86-24471
**HEAT TRANSFER COEFFICIENTS**
A quick method for estimating heat transfer to a coolant p 316 A86-23666
**HEAVING**
Energetics and optimum motion of oscillating lifting surfaces of finite span p 274 A86-25084
**HEAVY LIFT HELICOPTERS**
Aeromechanical stability analysis of a multirotor vehicle with application to hybrid heavy lift helicopter dynamics
p 290 A86-26141
**HELICOPTER CONTROL**
Automation effects in a multiloop manual control system p 329 A86-25035
Helicopter active control with blade stall alleviation modal capability p 307 A86-26136
A computer based study of helicopter agility, including the influence of an active tailplane p 291 A86-26146
Helicopter maneuvre stability - A new twist
p 307 A86-26160
Simulation concepts and testing of the tail rotor fly-by-wire system of the A129 helicopter
p 292 A86-26165
Helicopter attitude stabilization using individual-blade-control p 307 A86-26170
**HELICOPTER DESIGN**
One man and 3,000 million operations a second - Preparing for the LHX cockpit p 286 A86-24988
The helicopter and the other VTOL designs - An Interavia reader's manual p 287 A86-24989
Future helicopter developments p 269 A86-25023
Rotorcraft trends. II - Requirements and monitoring
p 287 A86-25089
Advanced technology - New fixes or new problems? --- for helicopter voice warning systems
p 328 A86-26031
Design of the 225-knot conventional rotor
p 289 A86-26116
Rotorcraft structural dynamic design modifications
p 289 A86-26117
The development and application of finite element stress analysis techniques at Westland Helicopters Ltd
p 330 A86-26118
Applications of numerical optimization methods to helicopter design problems - A survey
p 290 A86-26120
Optimum helicopter in the flight spectrum
p 290 A86-26123
The project for anti-tank helicopter
p 290 A86-26124
Impact of advanced technology on future helicopter preliminary design p 290 A86-26126
Analytical and experimental results of the ground resonance phenomenon for A.129 p 291 A86-26142

Design and testing of a large scale helicopter fuselage model in the RAE 5 metre pressurized wind tunnel
p 292 A86-26163

**HELICOPTER ENGINES**

The relationship of ultrafine filtration and oil debris monitoring for helicopter propulsion systems
p 305 A86-26154

The design of an advanced engineering gearbox
p 320 A86-26155

Tests on whole A129 engine bay simulating the inertia and aerodynamic loads p 292 A86-26164

Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed
[AD-A160862] p 294 N86-18322

**HELICOPTER PERFORMANCE**

Some thoughts on the vibration testing of helicopter equipment in the UK p 283 A86-23022

An overview of civil helicopter operations - Past, present and future p 279 A86-23800

The helicopter and the other VTOL designs - An Interavia reader's manual p 287 A86-24989

Stall flutter of helicopter blade p 306 A86-25205

Improvement of two blade sections for helicopter rotors p 288 A86-26103

Applications of an analysis of axisymmetric body effects on rotor performance and loads p 289 A86-26105

Applications of numerical optimization methods to helicopter design problems - A survey
p 290 A86-26120

A nonlinear model of aeroelastic behaviour of rotor blades in forward flight p 290 A86-26139

Studies of rotorcraft agility and maneuverability
p 291 A86-26145

A computer based study of helicopter agility, including the influence of an active tailplane p 291 A86-26146

DFVLR flying qualities research using operational helicopters p 307 A86-26147

DFVLR helicopter in-flight simulator for flying quality research p 310 A86-26148

Determination of limitations for helicopter ship-borne operations p 280 A86-26151

HC-Mk1 (Chinook) heated rotor blade icing test. I - Test vehicle, test site, approach and summary of testing
p 293 A86-26167

HC-Mk1 (Chinook) heated rotor blade icing test. II - Analysis of atomospheric conditions, aircraft and systems characteristics p 293 A86-26168

Helicopter vibration flight testing - The rotortuner approach p 293 A86-26169

Hover and forward flight acoustics and performance of a small-scale helicopter rotor system
[NASA-TM-88584] p 295 N86-19314

**HELICOPTER TAIL ROTORS**

Simulation concepts and testing of the tail rotor fly-by-wire system of the A129 helicopter
p 292 A86-26135

**HELICOPTER WAKES**

Three component hot-wire measurements in the wake of a rotor model p 320 A86-26111

**HELICOPTERS**

Influence of nonlinear blade damping on helicopter ground resonance instability p 283 A86-23185

Simulator design features for helicopter landing on small ships p 308 A86-23750

Recent advances in helicopter aerodynamics
[ONERA, TP NO. 1985-166] p 273 A86-24642

Cockpit advances in Boeing Vertol Company's Model 360 helicopter
[SAE PAPER 841629] p 298 A86-26032

Manufacturing control over the reproduction of high integrity parts - A way to improve the safety of aeronautical products p 320 A86-26122

A first step for reducing helicopter IFR approach minima Agusta A109 IFR CAT II certification
p 280 A86-26127

Airworthiness aspects of fatigue in helicopters
p 280 A86-26128

CRT displays in modern helicopter data presentation
p 299 A86-26129

Antenna siting on helicopters p 282 A86-26133

Hover test of a full-scale hingeless rotor
p 291 A86-26144

Aircrew-aircraft integration - A summary of U.S. Army research programs and plans p 310 A86-26149

Corrosion protection of helicopters through organic coatings p 313 A86-26159

Compressible, unsteady lifting-surface theory for a helicopter rotor in forward flight
[NASA-TP-2503] p 277 N86-18289

Calculation of helicopter airfoil characteristics for high tip-speed applications
[AD-A160694] p 277 N86-18294

An investigation of the use of bandwidth criteria for rotorcraft handling-qualities specifications
[AD-A160664] p 294 N86-18319

Flight operations noise tests of eight helicopters
[AD-A159835] p 331 N86-19127

Aerodynamics of two-dimensional blade-vortex interaction
[AD-A160662] p 295 N86-19315

Correlation of results of an OH-58A helicopter composite tail boom test with a finite element model
[AD-A161062] p 295 N86-19316

Determination of limitations for helicopter ship-borne operations
[NLR-MP-84072-U] p 295 N86-19319

Horizontal display for vertical flight: A direction of motion experiment
[AD-A161113] p 299 N86-19321

International Civil Aviation Organization Helicopter Noise Measurement Repeatability Program: US test report, Bell 206L-1, noise measurement flight test
[AD-A159898] p 333 N86-20090

**HELIPORTS**

Flight operations noise tests of eight helicopters
[AD-A159835] p 331 N86-19127

**HIGH ENERGY INTERACTIONS**

Analysis of gamma ray families and jets up to 10 to the 7th GeV obtained during 1000 hours exposure of emulsion chambers on the Concorde
p 333 A86-22863

**HIGH SPEED**

Design of the 225-knot conventional rotor
p 289 A86-26116

**HIGH TEMPERATURE**

High-temperature composite ducts
[SME PAPER MF85-501] p 319 A86-24663

**HIGHWAYS**

USSR report: Transportation
[JPRS-UTR-85-014] p 270 N86-18284

USSR report: Transportation
[JPRS-UTR-85-015] p 294 N86-18323

**HISTORIES**

Inertial navigation - The beginnings of an ingenious invention p 282 A86-25025

**HOLOGRAPHIC INTERFEROMETRY**

A holographic study of the vibrational modes of aircraft engine rotors p 301 A86-23756

**HORIZONTAL FLIGHT**

The use of analytical methods to assess aircraft maneuverability p 305 A86-23771

Feasibility of simplifying coupled lag-flap-torsional models for rotor blade stability in forward flight
p 290 A86-26138

Horizontal display for vertical flight: A direction of motion experiment
[AD-A161113] p 299 N86-19321

**HOT-WIRE ANEMOMETERS**

Three component hot-wire measurements in the wake of a rotor model p 320 A86-26111

**HOVERING**

Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model
[AIAA PAPER 86-0780] p 286 A86-24759

Automation effects in a multiloop manual control system p 329 A86-25035

Radial distribution circulation of a rotor in hover measured by laser velocimeter p 276 A86-26110

Three component hot-wire measurements in the wake of a rotor model p 320 A86-26111

Hover test of a full-scale hingeless rotor
p 291 A86-26144

Hover and forward flight acoustics and performance of a small-scale helicopter rotor system
[NASA-TM-88584] p 295 N86-19314

Horizontal display for vertical flight: A direction of motion experiment
[AD-A161113] p 299 N86-19321

**HUMAN FACTORS ENGINEERING**

Cockpit automation technology p 326 A86-23724

Computer-aided 'somatography' for the ergonomic design of the ATTAS experimental cockpit --- Advanced Technologies Testing Aircraft System
p 287 A86-25024

Flight deck design methodology using computarized anthropometric models
[SAE PAPER 841472] p 326 A86-26003

AI applications to military pilot decision aiding - A perspective on transition
[SAE PAPER 841533] p 327 A86-26004

Winging it in the 1980's - Why guidelines are needed for cockpit automation
[SAE PAPER 841634] p 328 A86-26022

The decision to fly --- by aircraft pilots
[SAE PAPER 841613] p 328 A86-26024

Aircrew-aircraft integration - A summary of U.S. Army research programs and plans p 310 A86-26149

**HUMIDITY**

The aircraft icing environment in wintertime, low ceiling conditions
[AD-A160578] p 280 N86-18307

Limited Surface Observations Climatic Summary (LISOCS). Parts A, C-F: Bremen International, West Germany
[AD-A159656] p 323 N86-18894

Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: General Billy Mitchell Field, Wisconsin
[AD-A159658] p 324 N86-18896

Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: Aviano AB, Italy
[AD-A159662] p 324 N86-18900

Giebelstadt ain Germany (West). Limited surface observations climatic summary (LISOCS): Parts A, C-F
[AD-A159664] p 324 N86-18902

**HYDRAULIC CONTROL**

A possible approach to the diagnostics of the hydraulic servomechanism of the aircraft control system
p 285 A86-23757

**HYDROCARBON FUELS**

Fuel deposit characteristics at low velocity
[ASME PAPER 85-IGT-130] p 313 A86-23922

**HYPERSONIC AIRCRAFT**

High speed aeronautics
[GPO-51-341] p 278 N86-19284

**HYPERSONIC FLOW**

On hypersonic flow around winged-vehicles at high angles of attack p 275 A86-25227

**I**

**ICE FORMATION**

The aircraft icing environment in wintertime, low ceiling conditions
[AD-A160578] p 280 N86-18307

Some microphysical processes affecting aircraft icing
[AD-A160375] p 325 N86-18921

Calculation of ice accretion on cylindrical rods according to Bain's model, and comparison with experimental results --- stratus clouds
[DFVLR-FB-85-46] p 325 N86-16933

**ICE PREVENTION**

HC-Mk1 (Chinook) heated rotor blade icing test. I - Test vehicle, test site, approach and summary of testing
p 293 A86-26167

HC-Mk1 (Chinook) heated rotor blade icing test. II - Analysis of atomospheric conditions, aircraft and systems characteristics p 293 A86-26168

**IDENTIFYING**

Performance of resonant radar target identification algorithms using intra-class weighting functions
p 321 N86-19490

**IMAGE PROCESSING**

Mellin-Fourier correlation
[AD-A159685] p 330 N86-20006

**IMAGE RESOLUTION**

Inflight resolution evaluation for thermal imaging systems p 296 A86-23272

**IMAGING TECHNIQUES**

Interactive modal imaging process for vibrating structures
[ASME PAPER 85-DET-110] p 318 A86-24231

**IMPACT ACCELERATION**

Effect of seat cushions of human respone to +Gz impact p 326 A86-25652

**IMPACT DAMAGE**

Small stone impact testing --- runway debris causing aircraft damage p 279 A86-23020

General aviation crashworthiness project, phase 3: Acceleration loads and velocity changes of survivable general aviation accidents
[NTSB/SR-85/02] p 280 N86-18306

**IMPACT STRENGTH**

Fundamental investigation on the impact strength of hollow fan blades
[NAL-TR-879] p 322 N86-19657

**IMPACT TESTS**

Small stone impact testing --- runway debris causing aircraft damage p 279 A86-23020

Effect of seat cushions of human respone to +Gz impact p 326 A86-25652

**IMPELLERS**

Investigation into the cause of failure of a turboprop impeller in service
[ASME PAPER 85-IGT-147] p 303 A86-23938

**IMPROVEMENT**

A comparative evaluation of the reliability improvement in line replaceable units warranted under the F-16 reliability improvement warranty
[AD-A160830] p 321 N86-18630

**IN-FLIGHT MONITORING**

Inflight resolution evaluation for thermal imaging systems p 296 A86-23272

Diagnostic methods for gas-turbine aircraft powerplants p 300 A86-23751

Determination of diagnostic parameters for the in situ diagnostics of the air-gas path of the AI-25TL engine p 300 A86-23752

In situ methods for crack detection in the master connecting rods of M 462 RF aircraft engines p 316 A86-23755

Airborne diagnostic equipment p 297 A86-23762

The measuring and control units of airborne recording systems p 297 A86-23763

The possibility of using the on-board computer for in-flight diagnostics p 297 A86-23765

The health and usage monitoring system of the Westland 30 series 300 helicopter p 299 A86-26153

**INCOHERENT SCATTER RADAR**

In-flight turbulence detection [AD-A160380] p 325 N86-18923

**INCOMPRESSIBLE FLOW**

The effect of compressibility on slender vortices p 317 A86-23944

Improved doublet lattice method for oscillating swept tapered wings in incompressible flow p 274 A86-25200

Test cases for the plane potential flow past multi-element aerofoils p 275 A86-25670

Aerodynamic transfer functions for a finite wing in incompressible flow [NAL-TR-867] p 278 N86-19286

**INCOMPRESSIBLE FLUIDS**

Aerodynamic design of an airfoil with allowance for the condition of nonseparated flow p 270 A86-23860

**INDEXES (DOCUMENTATION)**

An electronic index of articles pertaining to Air Force transportation in the post-World War 2 era, with abstracts of selected articles [AD-A160837] p 281 N86-18308

**INERTIAL GUIDANCE**

Gyroscopes may cease spinning --- in inertial guidance systems p 320 A86-25865

**INERTIAL NAVIGATION**

Economical in-flight calibration of air data sensors using inertial navigation units as reference p 284 A86-23270

Inertial navigation - The beginnings of an ingenious invention p 282 A86-25025

**INFERENCE**

Applications of expert systems p 330 N86-19634

**INFORMATION MANAGEMENT**

Presentation of information on multimode displays - Abnormal and emergency aircraft operations [SAE PAPER 841494] p 298 A86-26012

**INFORMATION SYSTEMS**

Aircraft measurements and coordination in FASINEX [AD-A160789] p 321 N86-18699

**INFRARED IMAGERY**

Inflight resolution evaluation for thermal imaging systems p 296 A86-23272

**INFRARED RADAR**

Remote sensing of oil on sea: Lidar and passive IR experiments p 320 N86-18370

**INKS**

Fire-retardant decorative inks for aircraft interiors [NASA-TM-88198] p 313 N86-18441

**INLET FLOW**

Aerodynamic detuning analysis of an unstalled supersonic turbofan cascade [ASME PAPER 85-GT-192] p 270 A86-22732

An experimental investigation of response of a turbojet engine to inlet distortion [ASME PAPER 85-IGT-12] p 301 A86-23832

Aerodynamic research on straight wall annular diffuser for turbofan augmentor [ASME PAPER 85-IGT-16] p 271 A86-23834

A study of ramjet engine. III - Air inlet performance as the engine component p 304 A86-25234

**INORGANIC COATINGS**

Corrosion protection of helicopters through organic coatings p 313 A86-26159

**INSPECTION**

A study of the service life of fail-safe airframe structures on the basis of routine inspections and crack size assessment p 281 A86-23769

**INSTRUMENT APPROACH**

The utility of Head-Up Displays - Eye-focus vs decision times p 297 A86-23728

Potential applications of multiple instrument approach concepts at 101 U.S. Airports [AD-A161155] p 283 N86-19308

**INSTRUMENT ERRORS**

Measurements accuracy with 3D laser velocimetry [ONERA, TO NO. 1985-171] p 318 A86-24646

Effects of measurement errors on estimation of the probability of vertical overlap p 280 A86-25214

**INSTRUMENT FLIGHT RULES**

Longitudinal flying qualitites criteria for single-pilot instrument flight operations p 305 A86-23186

A first step for reducing helicopter IFR approach minima Agusta A109 IFR CAT II certification p 280 A86-26127

**INSTRUMENT LANDING SYSTEMS**

Simple technique moistureproofs ILS localizer antenna array p 282 A86-23379

A first step for reducing helicopter IFR approach minima Agusta A109 IFR CAT II certification p 280 A86-26127

**INTEGRAL EQUATIONS**

Optimal control of integral-functional equations p 329 A86-23581

**INTELLIGIBILITY**

Effects of noise and workload on a communication task [AD-A160743] p 321 N86-18599

**INTERACTIONAL AERODYNAMICS**

A viscous-inviscid interaction model for transonic unsteady flow [ONERA, TP NO. 1985-152] p 272 A86-24630

Recent advances in helicopter aerodynamics [ONERA, TP NO. 1985-166] p 273 A86-24642

Aerodynamics of two-dimensional blade-vortex interaction [AD-A160662] p 295 N86-19315

**INTERPOLATION**

The conformal representation of the NACA 642A015 profile [VTH-M-502] p 277 N86-18296

**INVISCID FLOW**

A class of airfoils having finite trailing-edge pressure gradients p 270 A86-23184

A viscous-inviscid interaction model for transonic unsteady flow [ONERA, TP NO. 1985-152] p 272 A86-24630

Test cases for the plane potential flow past multi-element aerofoils p 275 A86-25670

Generation of the starting plane flowfield for supersonic flow over a spherically capped body [AD-A161117] p 278 N86-19291

**IONIZED GASES**

Longitudinal potential distribution in a jet of an ionized gas p 331 A86-23674

## J

**JET AIRCRAFT**

The test loads sequences applied to the CT4 full scale fatigue test [AD-A160736] p 294 N86-18320

Microburst wind shear models from the Joint Airport Weather Studies (JAWS) [AD-A159758] p 324 N86-18910

**JET AIRCRAFT NOISE**

High velocity gas jet noise control p 331 N86-19123

Laboratory experiments on active suppression of advanced turboprop noise [NASA-TM-87129] p 331 N86-19125

B-52G crew noise exposure study [AD-A161112] p 333 N86-20094

Experimental study of the acoustic fields far and near a Microturbo TRS 18 turboreactor [ISL-R-113/84] p 333 N86-20095

**JET ENGINE FUELS**

Gas turbine fuels and their influence on combustion --- Book p 312 A86-23274

The production of jet fuel from alternate sources [ASME PAPER 85-IGT-67] p 312 A86-23868

Test and evaluation of shale derived jet fuel by the United States Air Force [ASME PAPER 85-IGT-115] p 313 A86-23911

**JET ENGINES**

Determination of diagnostic parameters for the in situ diagnostics of the air-gas path of the AI-25TL engine p 300 A86-23752

Using wear products for assessing and predicting the condition of aircraft jet engines p 310 A86-23759

Vibration problems of jet engine rotor systems p 304 A86-25219

High velocity gas jet noise control p 331 N86-19123

**JET FLOW**

Experimental study of the acoustic fields far and near a Microturbo TRS 18 turboreactor [ISL-R-113/84] p 333 N86-20095

## K

**KALMAN FILTERS**

The study of adaptive control augmentation system implemented with microcomputer --- aircraft flight p 306 A86-24577

**KUTTA-JOUKOWSKI CONDITION**

The response of airfoils to periodic disturbances - The unsteady Kutta condition [AIAA PAPER 84-0050] p 270 A86-23126

## L

**LABORATORIES**

Research and development project selection methods at the air Force Wright Aeronautical Laboratories [AD-A161153] p 333 N86-20165

**LAMINAR FLOW**

Analysis of experimental data for a 21% thick natural laminar flow airfoil, NAE68-060-21:1 [NAE-AN-34] p 278 N86-19285

**LAMINAR FLOW AIRFOILS**

An experimental study of a high performance canard airfoil with boundary layer trip and vortex generators [AIAA PAPER 86-0781] p 273 A86-24780

The laminar wing - A way for improving the economy of commercial aircraft p 274 A86-25022

**LAMINAR WAKES**

Stator row unsteady aerodynamics due to wake excitations p 273 A86-24703

**LAMINATES**

A numerical analysis of singular stress fields at the free edge of layered composites [ONERA, TP NO. 1985-154] p 313 A86-24636

**LAND MOBILE SATELLITE SERVICE**

Communication with land vehicles and aircraft via satellite p 319 A86-25016

**LANDING AIDS**

Potential applications of multiple instrument approach concepts at 101 U.S. Airports [AD-A161155] p 283 N86-19308

**LANDING SIMULATION**

Simulator design features for helicopter landing on small ships p 308 A86-23750

**LASER APPLICATIONS**

The use of lasers in gas turbine manufacturing [ASME PAPER 85-IGT-141] p 317 A86-23933

Radial distribution circulation of a rotor in hover measured by laser velocimeter p 276 A86-26110

Aviaremont's efforts to introduce laser technology p 320 N86-18286

**LASER DOPPLER VELOCIMETERS**

The response of airfoils to periodic disturbances - The unsteady Kutta condition [AIAA PAPER 84-0050] p 270 A86-23126

Measurements accuracy with 3D laser velocimetry [ONERA, TO NO. 1985-171] p 318 A86-24646

An experimental investigation of propeller wakes using a laser Doppler velocimeter p 277 N86-19283

Experimental and theoretical study of incompressible flow around a wing profile with a spoiler. Contributions of laser velocimetry and the Dvorak method [ISL-R-116/84] p 279 N86-19297

**LASER GUIDANCE**

Low cost thermal control for flight test laser radar [SAE PAPER 851321] p 285 A86-23511

**LASER GYROSCOPES**

Sensor system concept for future fighter and strike aircraft p 297 A86-24583

Gyroscopes may cease spinning --- in inertial guidance systems p 320 A86-25865

**LASER SPECTROMETERS**

Wind tunnel calibration of a PMS (Particle Measuring Systems) canister instrumented for airflow measurement [AD-A161124] p 279 N86-19292

**LATERAL STABILITY**

Low-speed wind-tunnel investigation of the effect of strakes and nose machines on lateral-directional stability of a fighter configuration [NASA-TM-87641] p 278 N86-19287

**LEADING EDGE SLATS**

Means to increase the lift on aircraft wing profiles p 271 A86-23776

**LEADING EDGES**

Numerical simulation of leading-edge vortex flows p 270 A86-23133

Review of theory of vortex separated from a leading edge of a delta wing p 275 A86-25207

**LEAST SQUARES METHOD**

Parametric determination of lift interference for three-dimensional models in the Emmen (Switzerland) aircraft works wind tunnel [F+W-FO-1740] p 277 N86-18304

**LIAPUNOV FUNCTIONS**

Liapunov function for studying the stability in the whole of nonlinear systems p 331 A86-23576

**LIFT**

Wind tunnel wall influence considering two-dimensional high-lift configurations p 308 A86-23187

Two-dimensional scheme 'DLM-C' to examine subsonic unsteady lifting surface schemes for finite span p 275 A86-25239

Parametric determination of lift interference for three-dimensional models in the Emmen (Switzerland) aircraft works wind tunnel [F+W-FO-1740] p 277 N86-18304

**LIFT AUGMENTATION**

Means to increase the lift on aircraft wing profiles p 271 A86-23776

**LIFT DEVICES**

Compressible, unsteady lifting-surface theory for a helicopter rotor in forward flight [NASA-TP-2503] p 277 N86-18289

**LIFT DRAG RATIO**

Energy saving in aircraft p 288 A86-25188

Design of the 225-knot conventional rotor p 289 A86-26116

**LIFTING BODIES**

Doublet strip method for oscillating rectangular wings in subsonic flow p 274 A86-25189

Optimal lifting surfaces of wings of complex configurations at supersonic flight velocities p 288 A86-25423

Aerodynamics of lifting surfaces in steady flow --- Russian book p 275 A86-25599

**LIFTING ROTORS**

Compressible, unsteady lifting-surface theory for a helicopter rotor in forward flight [NASA-TP-2503] p 277 N86-18289

**LIGHT AIRCRAFT**

One man and 3,000 million operations a second - Preparing for the LHX cockpit p 286 A86-24988

**LIGHT BEAMS**

Gyroscopes may cease spinning --- in inertial guidance systems p 320 A86-25865

**LIGHTNING**

Locating and demagnetizing magnetized aircraft components following a lightning stroke p 286 A86-23767

Atmospheric electricity hazards threat environment definition [AD-A159739] p 324 N86-18909

**LINEAR SYSTEMS**

Application of mathematical optimization procedures to a structural model of a large finite-element wing [NASA-TM-87597] p 322 N86-19661

**LIQUID FILLED SHELLS**

Calculation of the heating of a liquid component partially filling a container p 316 A86-23653

**LIQUID FUELS**

Gas turbine fuels and their influence on combustion --- Book p 312 A86-23274

**LIQUID SLOSHING**

Calculation of the heating of a liquid component partially filling a container p 316 A86-23653

**LOAD DISTRIBUTION (FORCES)**

Improved doublet lattice method for oscillating swept tapered wings in incompressible flow p 274 A86-25200

Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed [AD-A160862] p 294 N86-18322

**LOADING RATE**

Performance computation of turbofan and turbojet engines in off-design conditions [F+W-FO-1746] p 305 N86-19323

**LOADS (FORCES)**

General aviation crashworthiness project, phase 3: Acceleration loads and velocity changes of survivable general aviation accidents [NTSB/SR-85/02] p 280 N86-18306

Loads and aeroelasticity division research and technology accomplishments for FY 1985 and plans for FY 1986 [NASA-TM-87676] p 278 N86-19288

Growth of cracks under constant amplitude fatigue loading: Example calculations [ESDU-84001] p 322 N86-19642

**LOGIC CIRCUITS**

Video processor for air traffic control beacon system [NASA-CASE-KSC-11155-1] p 283 N86-19304

**LOGIC DESIGN**

Applications of expert systems p 330 N86-19634

**LONGITUDINAL STABILITY**

Liapunov function for studying the stability in the whole of nonlinear systems p 331 A86-23576

**LORAN C**

Aircraft approach guidance using relative Loran-C navigation p 282 A86-24533

**LOW ALTITUDE**

Wide-angle, low-altitude flight simulator vision system for cockpit research and aircrew training p 311 A86-26152

**LOW ASPECT RATIO WINGS**

Aerodynamics of swept wings with medium and small aspect ratios. II p 272 A86-23948

**LOW SPEED STABILITY**

Low-speed wind-tunnel investigation of the effect of strakes and nose machines on lateral-directional stability of a fighter configuration [NASA-TM-87641] p 278 N86-19287

**LOW WEIGHT**

ARALL - A light weight structural material for impact and fatigue sensitive structures p 313 A86-26158

**LUBRICANT TESTS**

Determination of the service life of aviation oils p 312 A86-23450

**LUBRICATING OILS**

Determination of the service life of aviation oils p 312 A86-23450

The relationship of ultrafine filtration and oil debris monitoring for helicopter propulsion systems p 305 A86-26154

## M

**MACH NUMBER**

Current wind tunnel capability and planned improvements at Lewis Research Center [NASA-TM-87190] p 311 N86-18329

Generation of the starting plane flowfield for supersonic flow over a spherically capped body [AD-A161117] p 278 N86-19291

**MAGNETIC RECORDING**

Magnetic tape recording under severe environmental conditions p 314 A86-22716

Airborne instrumentation magnetic tape recording thru the early 90's p 315 A86-23253

**MAGNETIC STORAGE**

Airborne instrumentation magnetic tape recording thru the early 90's p 315 A86-23253

**MAINTAINABILITY**

Elastomeric rod end bearings - A solution for improving reliability and maintainability p 320 A86-26125

**MAN MACHINE SYSTEMS**

A study of programmable switch symbology --- for cockpits p 329 A86-23708

Concept flying - A method for deriving unique system requirements p 326 A86-23738

Automation effects in a multiloop manual control system p 329 A86-25035

Flight deck automation decisions [SAE PAPER 841471] p 326 A86-26002

Flight deck design methodology using computerized anthropometric models [SAE PAPER 841472] p 326 A86-26003

AI applications to military pilot decision aiding - A perspective on transition [SAE PAPER 841533] p 327 A86-26004

Automation in the cockpit - Who's in charge? [SAE PAPER 841534] p 327 A86-26005

Flight deck displays for managing wind shear encounters [SAE PAPER 841465] p 298 A86-26008

Cockpit advances in Boeing Vertol Company's Model 360 helicopter [SAE PAPER 841629] p 298 A86-26032

Horizontal display for vertical flight: A direction of motion experiment [AD-A161113] p 299 N86-19321

Applications of expert systems p 330 N86-19634

**MANAGEMENT SYSTEMS**

Safety aspects in stores management systems p 299 A86-26132

**MANEUVERABILITY**

The use of analytical methods to assess aircraft maneuverability p 305 A86-23771

Studies of rotorcraft agility and maneuverability p 291 A86-26145

A computer based study of helicopter agility, including the influence of an active tailplane p 291 A86-26146

Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed [AD-A160862] p 294 N86-18322

**MANEUVERS**

Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed [AD-A160862] p 294 N86-18322

**MANUAL CONTROL**

Automation effects in a multiloop manual control system p 329 A86-25035

**MANUALS**

Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed [AD-A160862] p 294 N86-18322

**MANUFACTURING**

High-temperature composite ducts [SME PAPER MF85-501] p 319 A86-24663

Robotic applications to automated composite aircraft component manufacturing [SME PAPER MF85-506] p 319 A86-24667

**MARINE ENVIRONMENTS**

Remote sensing of oil on sea: Lidar and passive IR experiments p 320 N86-18370

Determination of limitations for helicopter ship-borne operations [NLR-MP-84072-U] p 295 N86-19319

**MARITIME SATELLITES**

Communication with land vehicles and aircraft via satellite p 319 A86-25016

**MATHEMATICAL MODELS**

Frequency methods of aircraft identification --- Russian book p 306 A86-24148

A consistent mathematical model to simulate steady and unsteady rotor-blade aerodynamics p 276 A86-26108

Theoretical prediction of running-time measurements in unsteady flow --- for various shapes of rotor blade tips p 276 A86-26112

Microburst wind shear models from the Joint Airport Weather Studies (JAWS) [AD-A159756] p 324 N86-18910

Calculation of ice accretion on cylindrical rods according to Bain's model, and comparison with experimental results --- stratus clouds [DFVLR-FB-85-46] p 325 N86-18933

High velocity gas jet noise control p 331 N86-19123

**MEASURING INSTRUMENTS**

The measuring and control units of airborne recording systems p 297 A86-23763

**MECHANICAL PROPERTIES**

ARALL - A light weight structural material for impact and fatigue sensitive structures p 313 A86-26158

**MELLIN TRANSFORMS**

Mellin-Fourier correlation [AD-A159685] p 330 N86-20006

**METEOROLOGICAL FLIGHT**

Aircraft flow effects on cloud drop images and concentrations measured by the NAE Twin Otter p 322 A86-23289

Deduction of vertical motion in the atmosphere from aircraft measurements p 323 A86-23292

Progress in the analysis of atmospheric turbulence [ONERA, TP NO. 1985-164] p 323 A86-24631

**METEOROLOGICAL PARAMETERS**

Aircraft measurements and coordination in FASINEX [AD-A160789] p 321 N86-18699

Giebelstadt ain Germany (West). Limited surface observations climatic summary (LISOCS): Parts A, C-F [AD-A159664] p 324 N86-18902

Catalog of air weather service technical documents [AD-A159881] p 324 N86-18912

**MICROCOMPUTERS**

A VME bus microcomputer system for experiment control and analysis on board an aircraft p 297 A86-23313

The study of adaptive control augmentation system implemented with microcomputer --- aircraft flight p 306 A86-24577

Catalog of air weather service technical documents [AD-A159881] p 324 N86-18912

**MICROPHONES**

Report of noise measurements with 2 different microphone dispositions on airplane type Cessna F 172L [VTH-M-510] p 332 N86-19143

**MICROWAVE COUPLING**

Antenna siting on helicopters p 282 A86-26133

**MICROWAVE LANDING SYSTEMS**

Signal processing in the airborne receiver of the Interscan microwave landing system p 282 N86-19303

**MILITARY AIRCRAFT**

Automated Electromagnetic Compatibility (EMC) testing of Naval aircraft and integrated avionics p 284 A86-23254

Telemetry system prototype development --- for Naval aircraft flight tests p 281 A86-23268

Digital controlled closed loop air cycle development --- for military aircraft [SAE PAPER 851319] p 285 A86-23509

Concept flying - A method for deriving unique system requirements p 326 A86-23738

Flat rating concept introduced in the GTX engine p 304 A86-26071

Safety aspects in stores management systems p 299 A86-26132

Plastic media blast best for stripping p 269 A86-26274

**MILITARY AVIATION**

Test and evaluation of shale derived jet fuel by the United States Air Force [ASME PAPER 85-IGT-115] p 313 A86-23911

**MILITARY HELICOPTERS**
Some thoughts on the vibration testing of helicopter equipment in the UK p 283 A86-23022
One man and 3,000 million operations a second - Preparing for the LHX cockpit p 286 A86-24988
The development of an advanced helicopter research simulator
[SAE PAPER 841610] p 310 A86-26029
Comparison of voice types for helicopter voice warning systems
[SAE PAPER 841611] p 328 A86-26030
Prediction of auditory masking in helicopter noise
p 289 A86-26115
Composites in the development of Agusta helicopters
p 320 A86-26121
The project for anti-tank helicopter
p 290 A86-26124
Studies of rotorcraft agility and maneuverability
p 291 A86-26145
The relationship of ultrafine filtration and oil debris monitoring for helicopter propulsion systems
p 305 A86-26154
T700 - A program designed for early maturity and growth potential p 305 A86-26156
Simulation concepts and testing of the tail rotor fly-by-wire system of the A129 helicopter
p 292 A86-26165
Development testing of integrated avionics systems using dynamic environment simulation
p 330 A86-26166
Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed
[AD-A160862] p 294 N86-18322

**MILITARY OPERATIONS**
An electronic index of articles pertaining to Air Force transportation in the post-World War 2 era, with abstracts of selected articles
[AD-A160837] p 281 N86-18308

**MILITARY TECHNOLOGY**
Design and development of an inertial power supply unit for carrier-based aircraft p 304 A86-24861
Plastic media blast best for stripping
p 269 A86-26274

**MISSILE CONFIGURATIONS**
Aerodynamic characteristics of slender wing-gap-body combinations. II p 275 A86-25240

**MISSILE CONTROL**
Low cost thermal control for flight test laser radar
[SAE PAPER 851321] p 285 A86-23511

**MISSILE LAUNCHERS**
Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed
[AD-A160862] p 294 N86-18322

**MOISTURE RESISTANCE**
Environmental exposure effects on composite materials for commercial aircraft
[NASA-CR-177929] p 314 N86-18449

**MOMENTUM THEORY**
A study on the propulsive force of wings in non-steady motion by the theorem of momentum
p 275 A86-25233

**MONITORS**
A study of state of the art computer graphics systems for flight safety monitoring p 329 A86-23264

**MONOPOLE ANTENNAS**
Antenna siting on helicopters p 282 A86-26133

**MOTOR VEHICLES**
USSR report: Transportation
[JPRS-UTR-85-014] p 270 N86-18284
An electronic index of articles pertaining to Air Force transportation in the post-World War 2 era, with abstracts of selected articles
[AD-A160837] p 281 N86-18308
USSR report: Transportation
[JPRS-UTR-85-015] p 294 N86-18323

**MRCA AIRCRAFT**
Economical in-flight calibration of air data sensors using inertial navigation units as reference
p 284 A86-23270

## N

**NACELLES**
Calculation of the external nacelle surface for single and double stream jet engines for civil aircraft
[VTH-M-445] p 277 N86-18301

**NASA PROGRAMS**
Fundamental heat transfer research for gas turbine engines NASA workshop overview p 272 A86-24471

**NAVIER-STOKES EQUATION**
Solution of the Navier-Stokes equations in a compressible fluid by an implicit method
[ONERA, TP NO. 1985-148] p 272 A86-24634
Navier-Stokes solutions using finite volume procedures p 274 A86-25005
Navier-Stokes procedure for simulating two-dimensional and quasi-two-dimensional cascade flow
p 274 A86-25006

**NAVIGATION**
Horizontal display for vertical flight: A direction of motion experiment
[AD-A161113] p 299 N86-19321

**NAVIGATION AIDS**
Visually coupled EO system developed for the RAE Sea King XV371 p 299 A86-26130

**NAVIGATORS**
Flight training simulators. Effects of terrain accuracy on simulated radar image quality
[AD-A160905] p 311 N86-18333

**NEAR FIELDS**
Prediction and measurement of near fields for antennas on structures p 316 A86-23403

**NIGHT FLIGHTS (AIRCRAFT)**
Visually coupled EO system developed for the RAE Sea King XV371 p 299 A86-26130

**NOISE (SOUND)**
B-52G crew noise exposure study
[AD-A161112] p 333 N86-20094

**NOISE GENERATORS**
Airfoil tip vortex formation noise p 331 A86-23134

**NOISE INTENSITY**
Noise levels in cockpits of aircraft during normal cruise and considerations of auditory risk p 326 A86-25651

**NOISE MEASUREMENT**
Prediction of auditory masking in helicopter noise
p 289 A86-26115
Report of noise measurements with 2 different microphone dispositions on airplane type Cessna F 172L
[VTH-M-510] p 332 N86-19143

**NOISE POLLUTION**
B-52G crew noise exposure study
[AD-A161112] p 333 N86-20094

**NOISE PREDICTION (AIRCRAFT)**
Prediction of auditory masking in helicopter noise
p 289 A86-26115
Flight operations noise tests of eight helicopters
[AD-A159835] p 331 N86-19127
In-flight acoustic measurements on a light twin-engined turboprop airplane
[NASA-CR-178004] p 332 N86-20089

**NOISE REDUCTION**
Design approach for an optimum prop-fan propulsion system
[ASME PAPER 85-IGT-57] p 301 A86-23861
Prediction of auditory masking in helicopter noise
p 289 A86-26115
High velocity gas jet noise control
p 331 N86-19123
Laboratory experiments on active suppression of advanced turboprop noise
[NASA-TM-87129] p 331 N86-19125
Flight operations noise tests of eight helicopters
[AD-A159835] p 331 N86-19127
In-flight acoustic measurements on a light twin-engined turboprop airplane
[NASA-CR-178004] p 332 N86-20089
International Civil Aviation Organization Helicopter Noise Measurement Repeatability Program: US test report, Bell 206L-1, noise measurement flight test
[AD-A159898] p 333 N86-20090
B-52G crew noise exposure study
[AD-A161112] p 333 N86-20094

**NOMOGRAPHS**
A quick method for estimating heat transfer to a coolant p 316 A86-23666

**NONDESTRUCTIVE TESTS**
In situ methods for crack detection in the master connecting rods of M 462 RF aircraft engines
p 316 A86-23755
Probabilistic evaluation of individual aircraft tracking techniques
[AD-A160146] p 292 N86-18312
Ultrasonic f-scan inspection of composite materials
[AD-A159974] p 314 N86-18451

**NONLINEAR SYSTEMS**
Liapunov function for studying the stability in the whole of nonlinear systems p 331 A86-23576
Equivalent stiffness and damping coefficients for squeeze film dampers p 319 A86-25751
A nonlinear model of aeroelastic behaviour of rotor blades in forward flight p 290 A86-26139
Nonlinear analysis for dynamic behaviours of a coupled rotational vibration system near its critical speed
p 291 A86-26143

**NONUNIFORM FLOW**
Sound generation by an energetically inhomogeneous gas flow in a gas-turbine aircraft engine
p 300 A86-23753

**NOSES (FOREBODIES)**
Low-speed wind-tunnel investigation of the effect of strakes and nose machines on lateral-directional stability of a fighter configuration
[NASA-TM-87641] p 278 N86-19287

**NUCLEATION**
Nucleation of ice crystals in supercooled clouds caused by passage of an airplane p 323 A86-26175

**NUMERICAL ANALYSIS**
An electronic index of articles pertaining to Air Force transportation in the post-World War 2 era, with abstracts of selected articles
[AD-A160837] p 281 N86-18308

**NUMERICAL CONTROL**
Digital controlled closed loop air cycle development -- for military aircraft
[SAE PAPER 851319] p 285 A86-23509
Computer controlled variable pressure reducing/shut-off valve for aircraft ECS
[SAE PAPER 851380] p 285 A86-23545

## O

**OBSERVABILITY (SYSTEMS)**
A stable discrete-time adaptive observer applied to multivariable aircraft p 305 A86-23346

**OCEAN DATA ACQUISITIONS SYSTEMS**
Comparison of sea surface temperatures obtained from an aircraft using remote and direct sensing techniques
p 323 A86-23291

**OCEAN SURFACE**
Airborne radar. I - Air-to-surface p 296 A86-23293

**OCEANS**
USSR report: Transportation
[JPRS-UTR-85-014] p 270 N86-18284

**OIL POLLUTION**
Remote sensing of oil on sea: Lidar and passive IR experiments p 320 N86-18370

**ON-LINE SYSTEMS**
Flight test data acquisition and processing system
p 329 A86-23263

**ONBOARD DATA PROCESSING**
The telemetry system of the DFVLR experimental aircraft ATTAS p 281 A86-22729
A VME bus microcomputer system for experiment control and analysis on board an aircraft p 297 A86-23313

**OPERATING COSTS**
Design approach for an optimum prop-fan propulsion system
[ASME PAPER 85-IGT-57] p 301 A86-23861

**OPERATORS (PERSONNEL)**
Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed
[AD-A160862] p 294 N86-18322

**OPTICAL DATA PROCESSING**
Mellin-Fourier correlation
[AD-A159865] p 330 N86-20006

**OPTICAL GYROSCOPES**
Gyroscopes may cease spinning — in inertial guidance systems p 320 A86-25865

**OPTICAL RADAR**
Low cost thermal control for flight test laser radar
[SAE PAPER 851321] p 285 A86-23511
Remote sensing of oil on sea: Lidar and passive IR experiments p 320 N86-18370

**OPTIMAL CONTROL**
Optimal control of integral-functional equations
p 329 A86-23581
Optimal control change of state of aircraft turbine engine
[ASME PAPER 85-IGT-53] p 301 A86-23859

**OPTIMIZATION**
The problem of optimizing the final design modifications of stochastic oscillatory systems p 316 A86-23651
Optimization of stepped input signals in the frequency domain for parametric identification p 329 A86-24586
Application of mathematical optimization procedures to a structural model of a large finite-element wing
[NASA-TM-87597] p 322 N86-19661

**ORBIT CALCULATION**
Analytical evaluations of accuracy in determining and predicting parameters of artificial Earth satellite motion using altimeter measurement data p 312 N86-20196

**ORBITAL POSITION ESTIMATION**
Analytical evaluations of accuracy in determining and predicting parameters of artificial Earth satellite motion using altimeter measurement data p 312 N86-20196

**ORGANIC MATERIALS**
Corrosion protection of helicopters through organic coatings p 313 A86-26159

**OSCILLATIONS**
Transonic unsteady aerodynamics and its aeroelastic applications
[AGARD-CP-374-ADD-1] p 279 N86-19299

**OXIDATION RESISTANCE**
Determination of the service life of aviation oils
p 312 A86-23450

## P

**PAINTS**
Plastic media blast best for stripping
p 269 A86-26274
**PARALLEL PROCESSING (COMPUTERS)**
Partitioning and packing mathematical simulation models for calculation on parallel computers
[NASA-TM-87170] p 330 N86-19008
**PARAMETER IDENTIFICATION**
Optimization of stepped input signals in the frequency domain for parametric identification p 329 A86-24586
Design method for the calculation of performances and flap movement of flexible wind turbine blades
[VTH-M-453] p 323 N86-18795
Determination of performance and stability characteristics from dynamic maneuvers with a transport aircraft using parameter identification techniques
[NLR-MP-84024-U] p 308 N86-19326
**PARAMETERIZATION**
A stable discrete-time adaptive observer applied to multivariable aircraft p 305 A86-23346
**PARTICLE TRAJECTORIES**
Air flow and particle trajectories around aircraft fuselages. III - Extensions to particles of arbitrary shape
p 316 A86-23281
**PASSENGER AIRCRAFT**
Supersonic passenger decade p 288 A86-25848
Features of planned IL-96-300, IL-114 aircraft
p 294 N86-18325
**PATTERN RECOGNITION**
Mellin-Fourier correlation
[AD-A159685] p 330 N86-20006
**PCM TELEMETRY**
The data transmission and processing equipment of a high-precision trajectory measurement system
p 296 A86-22728
**PERFORMANCE PREDICTION**
Prediction and measurement of near fields for antennas on structures p 316 A86-23403
Design method for the calculation of performances and flap movement of flexible wind turbine blades
[VTH-M-453] p 323 N86-18795
Performance computation of turbofan and turbojet engines in off-design conditions
[F+W-FO-1746] p 305 N86-19323
Performance of resonant radar target identification algorithms using intra-class weighting functions
p 321 N86-19490
**PERFORMANCE TESTS**
Measurement of turbine blade temperature using pyrometer
[ASME PAPER 85-IGT-78] p 317 A86-23879
Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model
[AIAA PAPER 86-0780] p 286 A86-24759
Flight test evaluation of the Netherlands flight inspection aircraft
[NLR-MP-84052-U] p 295 N86-19318
**PERIPHERAL VISION**
A preliminary flight evaluation of the peripheral vision display using the NT-33A aircraft p 297 A86-23729
**PHASE SHIFT**
Laboratory experiments on active suppression of advanced turboprop noise
[NASA-TM-87129] p 331 N86-19125
**PHOTOGRAMMETRY**
Calibration of an on-ground aircraft tracking radar by aerial photogrammetry
[NAL-TR-861] p 282 N86-18311
**PHYSIOLOGICAL RESPONSES**
Effect of seat cushions of human respone to +Gz impact p 326 A86-25652
**PHYSIOLOGICAL TESTS**
The effects of vocal versus manual response modalities on multi-task performance
[AD-A159830] p 321 N86-18588
**PILOT ERROR**
Winging it in the 1960's - Why guidelines are needed for cockpit automation
[SAE PAPER 841634] p 328 A86-26022
**PILOT PERFORMANCE**
Concept flying - A method for deriving unique system requirements p 326 A86-23738
Flight deck automation decisions
[SAE PAPER 841471] p 326 A86-26002
Flight deck design methodology using computerized anthropometric models
[SAE PAPER 841472] p 326 A86-26003
AI applications to military pilot decision aiding - A perspective on transition
[SAE PAPER 841533] p 327 A86-26004
Automation in the cockpit - Who's in charge?
[SAE PAPER 841534] p 327 A86-26005
Flight deck displays for managing wind shear encounters
[SAE PAPER 841465] p 298 A86-26008
Effect of vibration on the readability of color CRT displays
[SAE PAPER 841466] p 327 A86-26009
Presentation of information on multimode displays - Abnormal and emergency aircraft operations
[SAE PAPER 841494] p 298 A86-26012
A review of pilot workload measurement techniques used on the A-10 single seat night attack test program
[SAE PAPER 841492] p 327 A86-26016
Advanced fighter technology integration (AFTI) F-16 - The pilot interface
[SAE PAPER 841633] p 327 A86-26018
Effects of digital altimetry on pilot workload
[SAE PAPER 841489] p 327 A86-26019
The decision to fly — by aircraft pilots
[SAE PAPER 841613] p 328 A86-26024
The effects of vocal versus manual response modalities on multi-task performance
[AD-A159830] p 321 N86-18588
Comparison of pilot effective time delay for cockpit controllers used on space shuttle and conventional aircraft
[NASA-TM-86030] p 307 N86-19324
**PILOT TRAINING**
Improving commercial aircraft training simulators
p 295 N86-19836
**PILOTS (PERSONNEL)**
Effects of noise and workload on a communication task
[AD-A160743] p 321 N86-18599
Horizontal display for vertical flight: A direction of motion experiment
[AD-A161113] p 299 N86-19321
**PITCH (INCLINATION)**
Energetics and optimum motion of oscillating lifting surfaces of finite span p 274 A86-25084
An experimental investigation of the influence of a range of aerofoil design features on dynamic stall onset
p 288 A86-26104
**PLANETARY BOUNDARY LAYER**
Automatic landing through the turbulent planetary boundary layer
[UTIAS-289] p 283 N86-19305
**PLANNING**
A comparative evaluation of the reliability improvement in line replaceable units warranted under the F-16 reliability improvement warranty
[AD-A160830] p 321 N86-18630
Loads and aeroelasticity division research and technology accomplishments for FY 1985 and plans for FY 1986
[NASA-TM-87676] p 278 N86-19288
**PLASTIC AIRCRAFT STRUCTURES**
Sukhoy design bureau builds sport plane made of plastic p 294 N86-18324
**PODS (EXTERNAL STORES)**
Calculation of the external nacelle surface for single and double stream jet engines for civil aircraft
[VTH-M-445] p 277 N86-18301
**POLLUTION MONITORING**
Remote sensing of oil on sea: Lidar and passive IR experiments p 320 N86-18370
**POLYMER PHYSICS**
The viscoelastic damping technology design guide for aerospace structures
[ASME PAPER 85-DET-104] p 318 A86-24230
**POLYNOMIALS**
The conformal representation of the NACA 642A015 profile
[VTH-M-502] p 277 N86-18296
**PORTABLE EQUIPMENT**
Acoustic guide for noise transmission testing of aircraft
[NASA-CASE-LAR-13111-1-CU] p 332 N86-20086
**POSITION (LOCATION)**
Study on the digital position transducer with optical time-delay pulse
[NAS-TR-878] p 322 N86-19583
**POSITIONING**
Report of noise measurements with 2 different microphone dispositions on airplane type Cessna F 172L
[VTH-M-510] p 332 N86-19143
High dynamic GPS receiver validation demonstration
[NASA-CR-176530] p 283 N86-19306
**POTENTIAL FLOW**
Aerodynamic design of an airfoil with allowance for the condition of nonseparated flow p 270 A86-23660
Longitudinal potential distribution in a jet of an ionized gas p 331 A86-23674
Test cases for the plane potential flow past multi-element aerofoils p 275 A86-25670
Elements of the aerodynamic theory of cyclogyro wing systems with concentrator effects
[VTH-LR-338] p 279 N86-19294
**POTENTIAL THEORY**
Elements of the aerodynamic theory of cyclogyro wing systems with concentrator effects
[VTH-LR-338] p 279 N86-19294
**POWDER METALLURGY**
Powdered, sintered alloy materials described: Development of titanium alloys p 314 N86-19447
**POWER SPECTRA**
Optimization of stepped input signals in the frequency domain for parametric identification p 329 A86-24586
**POWER SUPPLY CIRCUITS**
Efficiently meeting electric power needs for future aircraft p 319 A86-24829
**PRECIPITATION (METEOROLOGY)**
Limited Surface Observations Climatic Summary (LISOCS). Parts A, C-F: Bremen International, West Germany
[AD-A159656] p 323 N86-18894
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: General Billy Mitchell Field, Wisconsin
[AD-A159658] p 324 N86-18896
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: Aviano AB, Italy
[AD-A159662] p 324 N86-18900
Giebelstadt ain Germany (West). Limited surface observations climatic summary (LISOCS): Parts A, C-F
[AD-A159664] p 324 N86-18902
**PREDICTION ANALYSIS TECHNIQUES**
Prediction of blade flutter in a tuned rotor
[ASME PAPER 85-IGT-100] p 302 A86-23899
The aircraft icing environment in wintertime, low ceiling conditions
[AD-A160578] p 280 N86-18307
**PRESSURE DISTRIBUTION**
A propeller model for studying trace velocity effects on interior noise p 284 A86-23191
Aerodynamic design of an airfoil with allowance for the condition of nonseparated flow p 270 A86-23660
Calculation of helicopter airfoil characteristics for high tip-speed applications
[AD-A160694] p 277 N86-18294
**PRESSURE EFFECTS**
Experimental study of the effects on the turbofan engine by the distortion p 304 A86-25192
**PRESSURE MEASUREMENT**
Comparative measurements of the unsteady pressures and the tip-vortex parameters on four oscillating wing tip models p 273 A86-24708
Comparative measurements of the unsteady pressures and the tip-vortex parameters of four oscillating wing tip models p 276 A86-26109
Wind tunnel calibration of a PMS (Particle Measuring Systems) canister instrumented for airflow measurement
[AD-A161124] p 278 N86-19292
**PRESSURE OSCILLATIONS**
Pressure fluctuations on the external surface of an aircraft p 271 A86-23780
**PRESSURE REDUCTION**
Computer controlled variable pressure reducing/shut-off valve for aircraft ECS
[SAE PAPER 851360] p 285 A86-23545
**PRESSURE SENSORS**
A new high temperature silicon on sapphire transducer for jet engine control applications p 315 A86-23266
Aircraft measurements and coordination in FASINEX
[AD-A160789] p 321 N86-18699
**PRESSURE VESSELS**
Computer controlled variable pressure reducing/shut-off valve for aircraft ECS
[SAE PAPER 851360] p 285 A86-23545
**PRINCIPAL COMPONENTS ANALYSIS**
Composite statistical method for modeling wind gusts
p 308 A86-23189
**PROBABILITY DENSITY FUNCTIONS**
Effects of measurement errors on estimation of the probability of vertical overlap p 280 A86-25214
**PROBABILITY THEORY**
Probabilistic evaluation of individual aircraft tracking techniques
[AD-A160146] p 282 N86-18312
**PROCEDURES**
Research and development project selection methods at the air Force Wright Aeronautical Laboratories
[AD-A161153] p 333 N86-20165
**PRODUCTION ENGINEERING**
The use of lasers in gas turbine manufacturing
[ASME PAPER 85-IGT-141] p 317 A86-23933

**PROP-FAN TECHNOLOGY**
Design approach for an optimum prop-fan propulsion system
[ASME PAPER 85-IGT-57] p 301 A86-23861
Propeller design point calculation method for comparing turbofan/propfan engine performance
[ASME PAPER 85-IGT-150] p 303 A86-23941
The prop-fan introduces a new engine generation
p 304 A86-25021

**PROPELLER BLADES**
Aeroacoustics of an advanced propeller design under takekoff and landing conditions p 284 A86-23190
Distribution of optimal circulation on a proneller blade with a nonlinear dependence on the number of blades and with allowance tapering p 271 A86-23778
The prop-fan introduces a new engine generation
p 304 A86-25021

**PROPELLER EFFICIENCY**
Distribution of optimal circulation on a propeller blade with a nonlinear dependence on the number of blades and with allowance tapering p 271 A86-23778

**PROPELLER SLIPSTREAMS**
Aerodynamic characteristics of general aviation at high angle of attack with the propeller slip stream
p 306 A86-25204

**PROPELLERS**
Propeller design point calculation method for comparing turbofan/propfan engine performance
[ASME PAPER 85-IGT-150] p 303 A86-23941
Laboratory experiments on active suppression of advanced turboprop noise
[NASA-TM-87129] p 331 N86-19125
An experimental investigation of propeller wakes using a laser Doppler velocimeter p 277 N86-19283
Technical evaluation report on the Fluid Dynamics Panel Symposium on Aerodynamics and Acoustics of Propellers
[AGARD-AR-213] p 279 N86-19298

**PROPULSION SYSTEM CONFIGURATIONS**
Design approach for an optimum prop-fan propulsion system
[ASME PAPER 85-IGT-57] p 301 A86-23861

**PROPULSION SYSTEM PERFORMANCE**
Design approach for an optimum prop-fan propulsion system
[ASME PAPER 85-IGT-57] p 301 A86-23861
A study of ramjet engine. III - Air inlet performance as the engine component p 304 A86-25234
Current wind tunnel capability and planned improvements at Lewis Research Center
[NASA-TM-87190] p 311 N86-18329

**PROPULSIVE EFFICIENCY**
A study on the propulsive force of wings in non-steady motion by the theorem of momentum
p 275 A86-25233
Current wind tunnel capability and planned improvements at Lewis Research Center
[NASA-TM-87190] p 311 N86-18329

**PROTECTIVE COATINGS**
Corrosion protection of helicopters through organic coatings p 313 A86-26159

**PSYCHOMETRICS**
A review of pilot workload measurement techniques used on the A-10 single seat night attack test program
[SAE PAPER 841492] p 327 A86-26016

**PSYCHOMOTOR PERFORMANCE**
The effects of vocal versus manual response modalities on multi-task performance
[AD-A159830] p 321 N86-18588

**PULSE AMPLITUDE**
Video processor for air traffic control beacon system
[NASA-CASE-KSC-11155-1] p 283 N86-19304

**PULSE CODE MODULATION**
Use of video cassette recorders for combined video and PCM data recording p 315 A86-23256

**PULSE COMMUNICATION**
Distributed sensor networks
[AD-A160596] p 332 N86-19136

**PYROMETERS**
Measurement of turbine blade temperature using pyrometer
[ASME PAPER 85-IGT-78] p 317 A86-23879

## Q

**QUADRATIC EQUATIONS**
Optimal control of integral-functional equations
p 329 A86-23581

**QUALITY CONTROL**
AVIP Air Force thrust for reliability --- AVionics Integrity Programs p 315 A86-23003
Manufacturing control over the reproduction of high integrity parts - A way to improve the safety of aeronautical products p 320 A86-26122

## R

**RADAR BEACONS**
Video processor for air traffic control beacon system
[NASA-CASE-KSC-11155-1] p 283 N86-19304

**RADAR CROSS SECTIONS**
Performance of resonant radar target identification algorithms using intra-class weighting functions
p 321 N86-19490

**RADAR EQUIPMENT**
Mode-S beacon system to cover all U.S. upper airspace by 1991 p 281 A86-23376
Potential applications of multiple instrument approach concepts at 101 U.S. Airports
[AD-A161155] p 283 N86-19308

**RADAR IMAGERY**
Flight training simulators. Effects of terrain accuracy on simulated radar image quality
[AD-A160905] p 311 N86-18333
Remote sensing of oil on sea: Lidar and passive IR experiments p 320 N86-18370

**RADAR MAPS**
Flight training simulators. Effects of terrain accuracy on simulated radar image quality
[AD-A160905] p 311 N86-18333

**RADAR SIGNATURES**
Performance of resonant radar target identification algorithms using intra-class weighting functions
p 321 N86-19490

**RADAR TARGETS**
Comparison of two target classification techniques
p 318 A86-23951
Performance of resonant radar target identification algorithms using intra-class weighting functions
p 321 N86-19490

**RADIO ALTIMETERS**
Economical in-flight calibration of air data sensors using inertial navigation units as reference
p 284 A86-23270
Presentation of radar altitude information on the HUD
[SAE PAPER 841464] p 298 A86-26007

**RADIOMETERS**
Aircraft measurements and coordination in FASINEX
[AD-A160789] p 321 N86-18699

**RADIOSONDES**
The aircraft icing environment in wintertime, low ceiling conditions
[AD-A160578] p 280 N86-18307

**RADOMES**
Aircraft measurements and coordination in FASINEX
[AD-A160789] p 321 N86-18699

**RAIL TRANSPORTATION**
USSR report: Transportation
[JPRS-UTR-85-014] p 270 N86-18284
USSR report: Transportation
[JPRS-UTR-85-015] p 294 N86-18323

**RAIN**
Simple technique moistureproofs ILS localizer antenna array p 282 A86-23379

**RANDOM LOADS**
Fatigue crack propagation under spectrum loading
[NAL-TM-MT-8502] p 322 N86-19656

**RANDOM PROCESSES**
Autoparametric vibration of coupled beams under random support motion
[ASME PAPER 85-DET-184] p 318 A86-24246

**RATINGS**
Wind shear investigation program at the NLR
[NLR-MP-84027-U] p 325 N86-19808

**REAL TIME OPERATION**
Advanced medium scale real-time system --- for evaluation of flight tests p 296 A86-22720
Telemetry system prototype development --- for Naval aircraft flight tests p 281 A86-23268
The role of a real-time flight support facility in flight research programs
[NASA-TM-86805] p 311 N86-19330

**RECORDING INSTRUMENTS**
The measuring and control units of airborne recording systems p 297 A86-23763

**REDUNDANCY**
Flight test of a resident backup software system
[NASA-TM-86807] p 307 N86-19325

**REFINING**
The production of jet fuel from alternate sources
[ASME PAPER 85-IGT-67] p 312 A86-23868

**RELIABILITY**
Elastomeic rod end bearings - A solution for improving reliability and naintainability p 320 A86-26125
A comparative evaluation of the reliability improvement in line replaceable units warranted under the F-16 reliability improvement warranty
[AD-A160630] p 321 N86-18630

**RELIABILITY ANALYSIS**
Institute of Environmental Sciences, Annual Technical Meeting, 31st, Las Vegas, NV, April 30-May 2, 1985, Proceedings p 314 A86-23001

**RELIABILITY ENGINEERING**
Institute of Environmental Sciences, Annual Technical Meeting, 31st, Las Vegas, NV, April 30-May 2, 1985, Proceedings p 314 A86-23001
AVIP Air Force thrust for reliability --- AVionics Integrity Programs p 315 A86-23003

**REMOTE SENSING**
Comparison of sea surface temperatures obtained from an aircraft using remote and direct sensing techniques
p 323 A86-23291
D-CALM - New research aircraft for remote sensing
p 287 A86-25020

**REMOTELY PILOTED VEHICLES**
Advances in simulation, control and guidance and other systems for manned and unmanned aircraft
p 269 A86-26072

**RESEARCH**
Research and development project selection methods at the air Force Wright Aeronautical Laboratories
[AD-A161153] p 333 N86-20165

**RESEARCH AIRCRAFT**
Aircraft flow effects on cloud drop images and concentrations measured by the NAE Twin Otter
p 322 A86-23289
Comparison of sea surface temperatures obtained from an aircraft using remote and direct sensing techniques
p 323 A86-23291
D-CALM - New research aircraft for remote sensing
p 287 A86-25020
Aircraft measurements and coordination in FASINEX
[AD-A160789] p 321 N86-18699
The role of a real-time flight support facility in flight research programs
[NASA-TM-86805] p 311 N86-19330

**RESEARCH AND DEVELOPMENT**
The role of the Flight Test Department in the development of new technology aircraft
p 285 A86-23271
Future helicopter developments p 269 A86-25023
Research and development of FJR 710 turbo fan engine - Second phase p 304 A86-25177
The development of an advanced helicopter research simulator
[SAE PAPER 841610] p 310 A86-26029
Advanced technology - New fixes or new problems? --- for helicopter voice warning systems
p 328 A86-26031
Advances in simulation, control and guidance and other systems for manned and unmanned aircraft
p 269 A86-26072
High speed aeronautics
[GPO-51-341] p 278 N86-19284

**RESEARCH MANAGEMENT**
Loads and aeroelasticity division research and technology accomplishments for FY 1985 and plans for FY 1986
[NASA-TM-87676] p 278 N86-19288

**RESONANCE**
Hover test of a full-scale hingeless rotor
p 291 A86-26144

**RESONANCE TESTING**
Resonance fatigue test of the empennage of a CT4 aircraft
[AD-A160749] p 294 N86-18321

**RESONANT FREQUENCIES**
Performance of resonant radar target identification algorithms using intra-class weighting functions
p 321 N86-19490

**RESONANT VIBRATION**
The viscoelastic damping technology design guide for aerospace structures
[ASME PAPER 85-DET-104] p 318 A86-24230
Excitation of blade vibration by flow induced acoustic resonances in axial-flow compressors
p 303 A86-24712

**RIGID ROTORS**
Feasibility of simplifying coupled lag-flap-torsional models for rotor blade stability in forward flight
p 290 A86-26138

**RING LASERS**
Gyroscopes may cease spinning --- in inertial guidance systems p 320 A86-25865

**RIVERS**
USSR report: Transportation
[JPRS-UTR-85-014] p 270 N86-18284

**ROBOTS**
Robotic applications to automated composite aircraft component manufacturing
[SME PAPER MF85-506] p 319 A86-24667

**ROCKS**
Small stone impact testing --- runway debris causing aircraft damage p 279 A86-23020

**RODS**
Calculation of ice accretion on cylindrical rods according to Bain's model, and comparison with experimental results --- stratus clouds
[DFVLR-FB-85-46] p 325 N86-18933
**ROTARY STABILITY**
Prediction of blade flutter in a tuned rotor
[ASME PAPER 85-IGT-100] p 302 A86-23899
**ROTARY WING AIRCRAFT**
An estimation of the wall interference on a two-dimensional circulation control airfoil
[AIAA PAPER 86-0738] p 273 A86-24732
An investigation of the use of bandwidth criteria for rotorcraft handling-qualities specifications
[AD-A160664] p 294 N86-18319
**ROTARY WINGS**
Stall flutter of helicopter blade p 306 A86-25205
Improvement of two blade sections for helicopter rotors p 288 A86-26103
An experimental investigation of the parallel blade-vortex interaction p 276 A86-26106
Radial distribution circulation of a rotor in hover measured by laser velocimeter p 276 A86-26110
Theoretical prediction of running-time measurements in unsteady flow --- for various shapes of rotor blade tips
p 276 A86-26112
A theoretical analysis of the effect of thrust-related turbulence distortion on helicopter rotor low-frequency broadband noise p 289 A86-26113
Design of the 225-knot conventional rotor
p 289 A86-26116
Investigation on a small scale model of ducted composite counterrotating rotor p 289 A86-26119
Helicopter active control with blade stall alleviation modal capability p 307 A86-26136
A nonlinear model of aeroelastic behaviour of rotor blades in forward flight p 290 A86-26139
Nonlinear analysis for dynamic behaviours of a coupled rotational vibration system near its critical speed
p 291 A86-26143
Hover test of a full-scale hingeless rotor
p 291 A86-26144
Tests on a new dynamically scaled model rotor in the RAE 24 ft Wind Tunnel p 292 A86-26162
HC-Mk1 (Chinook) heated rotor blade icing test. I - Test vehicle, test site, approach and summary of testing
p 293 A86-26167
HC-Mk1 (Chinook) heated rotor blade icing test. II - Analysis of atomospheric conditions, aircraft and systems characteristics p 293 A86-26168
Helicopter attitude stabilization using individual-blade-control p 307 A86-26170
Calculation of helicopter airfoil characteristics for high tip-speed applications
[AD-A160694] p 277 N86-18294
Effects of blade-to-blade dissimilarities on rotor-body lead-lag dynamics
[AD-A160497] p 293 N86-18317
Elements of the aerodynamic theory of cyclogyro wing systems with concentrator effects
[VTH-LR-338] p 279 N86-19294
Hover and forward flight acoustics and performance of a small-scale helicopter rotor system
[NASA-TM-86584] p 295 N86-19314
Aerodynamics of two-dimensional blade-vortex interaction
[AD-A160662] p 295 N86-19315
**ROTATING DISKS**
The solution of the thermal elastic-plastic problem of turbine disk by the incremental finite element method
[ASME PAPER 85-IGT-112] p 317 A86-23909
**ROTOR AERODYNAMICS**
The development of a second-generation of Controlled Diffusion Airfoils for multistage compressors
[ASME PAPER 85-IGT-9] p 271 A86-23830
Recent advances in helicopter aerodynamics
[ONERA, TP NO. 1985-166] p 273 A86-24642
Improvement of two blade sections for helicopter rotors p 288 A86-26103
A consistent mathematical model to simulate steady and unsteady rotor-blade aerodynamics p 276 A86-26108
Radial distribution circulation of a rotor in hover measured by laser velocimeter p 276 A86-26110
A theoretical analysis of the effect of thrust-related turbulence distortion on helicopter rotor low-frequency broadband noise p 289 A86-26113
Hover test of a full-scale hingeless rotor
p 291 A86-26144
A review of RAE experimental techniques for rotor dynamics and aerodynamics p 292 A86-26161
Tests on a new dynamically scaled model rotor in the RAE 24 ft Wind Tunnel p 292 A86-26162
**ROTOR BLADES**
Influence of nonlinear blade damping on helicopter ground resonance instability p 283 A86-23185
Prediction of blade flutter in a tuned rotor
[ASME PAPER 85-IGT-100] p 302 A86-23899
Vibration problems of jet engine rotor systems
p 304 A86-25219
Improvement of two blade sections for helicopter rotors p 288 A86-26103
An experimental investigation of the influence of a range of aerofoil design features on dynamic stall onset
p 288 A86-26104
Some calculations of tip vortex - Blade loadings
p 276 A86-26107
A consistent mathematical model to simulate steady and unsteady rotor-blade aerodynamics p 276 A86-26108
Comparative measurements of the unsteady pressures and the tip-vortex parameters of four oscillating wing tip models p 276 A86-26109
Theoretical prediction of running-time measurements in unsteady flow --- for various shapes of rotor blade tips
p 276 A86-26112
Feasibility of simplifying coupled lag-flap-torsional models for rotor blade stability in forward flight
p 290 A86-26138
Nonlinear analysis for dynamic behaviours of a coupled rotational vibration system near its critical speed
p 291 A86-26143
Tests on a new dynamically scaled model rotor in the RAE 24 ft Wind Tunnel p 292 A86-26162
Helicopter attitude stabilization using individual-blade-control p 307 A86-26170
**ROTOR BLADES (TURBOMACHINERY)**
Aerodynamic detuning analysis of an unstalled supersonic turbofan cascade
[ASME PAPER 85-GT-192] p 270 A86-22732
Stator row unsteady aerodynamics due to wake excitations p 273 A86-24703
A review of RAE experimental techniques for rotor dynamics and aerodynamics p 292 A86-26161
**ROTOR BODY INTERACTIONS**
Applications of an analysis of axisymmetric body effects on rotor performance and loads p 289 A86-26105
**ROTORCRAFT AIRCRAFT**
Rotorcraft trends. II - Requirements and monitoring
p 287 A86-25089
**ROTORS**
A holographic study of the vibrational modes of aircraft engine rotors p 301 A86-23756
Equivalent stiffness and damping coefficients for squeeze film dampers p 319 A86-25751
**RUDDERS**
Problems in rudder design for small transport aircraft
p 306 A86-23781
**RUNWAY CONDITIONS**
Small stone impact testing --- runway debris causing aircraft damage p 279 A86-23020

# S

**SAGNAC EFFECT**
Gyroscopes may cease spinning --- in inertial guidance systems p 320 A86-25865
**SANDWICH STRUCTURES**
Fire-retardent decorative inks for aircraft interiors
[NASA-TM-88198] p 313 N86-18441
**SATELLITE TRANSMISSION**
The role of a real-time flight support facility in flight research programs
[NASA-TM-86805] p 311 N86-19330
**SCALE MODELS**
Tests on a new dynamically scaled model rotor in the RAE 24 ft Wind Tunnel p 292 A86-26162
**SCANNING**
Effects of digital altimetry on pilot workload
[SAE PAPER 841489] p 327 A86-26019
Ultrasonic f-scan inspection of composite materials
[AD-A159974] p 314 N86-18451
**SEA SURFACE TEMPERATURE**
Comparison of sea surface temperatures obtained from an aircraft using remote and direct sensing techniques
p 323 A86-23291
**SEAT BELTS**
General aviation crashworthiness project, phase 3: Acceleration loads and velocity changes of survivable general aviation accidents
[NTSB/SR-85/02] p 280 N86-18306
**SEATS**
Effect of seat cushions of human respone to +Gz impact p 326 A86-25652
**SELECTION**
Research and development project selection methods at the air Force Wright Aeronautical Laboratories
[AD-A161153] p 333 N86-20165
**SEPARATED FLOW**
A viscous-inviscid interaction model for transonic unsteady flow
[ONERA, TP NO. 1985-152] p 272 A86-24630
Optical fibers application to visualization of flow separation inside an aircraft intake in wind tunnel
[ONERA, TP NO. 1985-156] p 309 A86-24638
Stator row unsteady aerodynamics due to wake excitations p 273 A86-24703
On the separatud flow over a delta wing at high subsonic and transonic speeds
[VTH-M-527] p 279 N86-19293
**SERVICE LIFE**
Determination of the service life of aviation oils
p 312 A86-23450
A study of the service life of fail-safe airframe structures on the basis of routine inspections and crack size assessment p 286 A86-23769
Life prediction for the main shaft of aircraft turbine engine
[ASME PAPER 85-IGT-136] p 303 A86-23928
Interactive effects of high- and low-frequency loading on fatigue
[AD-A160601] p 293 N86-18318
**SERVOMECHANISMS**
A possible approach to the diagnostics of the hydraulic servomechanism of the aircraft control system
p 285 A86-23757
**SH-3 HELICOPTER**
Visually coupled EO system developed for the RAE Sea King XV371 p 299 A86-26130
**SHALE OIL**
The production of jet fuel from alternate sources
[ASME PAPER 85-IGT-67] p 312 A86-23868
Test and evaluation of shale derived jet fuel by the United States Air Force
[ASME PAPER 85-IGT-115] p 313 A86-23911
**SHELLS (STRUCTURAL FORMS)**
The finite element stress analysis for solid-shell combined parts in aeroengines
[ASME PAPER 85-IGT-72] p 317 A86-23873
**SHIPS**
Simulator design features for helicopter landing on small ships p 308 A86-23750
USSR report: Transportation
[JPRS-UTR-85-015] p 294 N86-18323
Determination of limitations for helicopter ship-borne operations
[NLR-MP-84072-U] p 295 N86-19319
**SHOCK WAVE PROPAGATION**
An experimental investigation of the parallel blade-vortex interaction p 276 A86-26106
**SHOCK WAVES**
Calculation of helicopter airfoil characteristics for high tip-speed applications
[AD-A160694] p 277 N86-18294
**SHORT TAKEOFF AIRCRAFT**
Small stone impact testing --- runway debris causing aircraft damage p 279 A86-23020
**SHROUDED TURBINES**
The forced response of shrouded fan stages
[ASME PAPER 85-DET-10] p 303 A86-24226
**SIDELOBE REDUCTION**
Video processor for air traffic control beacon system
[NASA-CASE-KSC-11155-1] p 283 N86-19304
**SIGNAL ANALYSIS**
Video processor for air traffic control beacon system
[NASA-CASE-KSC-11155-1] p 283 N86-19304
**SIGNAL MEASUREMENT**
Aircraft measurements and coordination in FASINEX
[AD-A160789] p 321 N86-18699
**SIGNAL MIXING**
Effects of measurement errors on estimation of the probability of vertical overlap p 280 A86-25214
**SIGNAL PROCESSING**
Frequency methods of aircraft identification --- Russian book p 306 A86-24148
In-flight turbulence detection
[AD-A160380] p 325 N86-18923
Signal processing in the airborne receiver of the Interscan microwave landing system
p 282 N86-19303
**SIGNAL TO NOISE RATIOS**
Prediction of auditory masking in helicopter noise
p 289 A86-26115
**SIMULATION**
An improved smoke generator for aircraft testing
p 308 A86-23265
Current wind tunnel capability and planned improvements at Lewis Research Center
[NASA-TM-87190] p 311 N86-18329
Environmental exposure effects on composite materials for commercial aircraft
[NASA-CR-177929] p 314 N86-18449
**SIMULATORS**
Status and capabilities of sonic boom simulators
[NASA-TM-87664] p 332 N86-20088
**SINTERING**
Powdered, sintered alloy materials described: Development of titanium alloys p 314 N86-19447

**SLENDER BODIES**
Aerodynamic characteristics of slender wing-gap-body combinations. II p 275 A86-25240
Applications of an analysis of axisymmetric body effects on rotor performance and loads p 289 A86-26105

**SMALL PERTURBATION FLOW**
New aspects of the small-perturbation method in aerodynamics p 271 A86-23770

**SMOKE**
An improved smoke generator for aircraft testing p 308 A86-23265

**SMOKE DETECTORS**
An improved smoke generator for aircraft testing p 308 A86-23265

**SOLAR ARRAYS**
Development of autonomous power system testbed p 311 A86-24841

**SONIC BOOMS**
Status and capabilities of sonic boom simulators [NASA-TM-87664] p 332 N86-20088

**SOS (SEMICONDUCTORS)**
A new high temperature silicon on sapphire transducer for jet engine control applications p 315 A86-23266

**SOUND PRESSURE**
A propeller model for studying trace velocity effects on interior noise p 284 A86-23191
In-flight acoustic measurements on a light twin-engined turboprop airplane [NASA-CR-178004] p 332 N86-20089

**SPACE SHUTTLES**
Comparison of pilot effective time delay for cockpit controllers used on space shuttle and conventional aircraft [NASA-TM-86030] p 307 N86-19324

**SPACE STATIONS**
Electric power management and distribution for air and space applications p 319 A86-24828

**SPACECRAFT MOTION**
Analytical evaluations of accuracy in determining and predicting parameters of artificial Earth satellite motion using altimeter measurement data p 312 N86-20196

**SPACECRAFT POWER SUPPLIES**
Electric power management and distribution for air and space applications p 319 A86-24828
Development of autonomous power system testbed p 311 A86-24841

**SPARE PARTS**
Method of spare parts - Digital simulation of aircraft turbine engine control system [ASME PAPER 85-IGT-52] p 301 A86-23858

**SPECIFICATIONS**
An approach to developing specification measures p 330 N86-19968

**SPEECH**
Effects of noise and workload on a communication task [AD-A160743] p 321 N86-18599

**SPHERES**
Generation of the starting plane flowfield for supersonic flow over a spherically capped body [AD-A161117] p 278 N86-19291

**SPOILERS**
Studies of the aerodynamics of flaps and spoilers in unsteady flow [ONERA, TP NO. 1985-149] p 272 A86-24627
The 737 graphite composite flight spoiler flight service evaluation [NASA-CR-172600] p 314 N86-18448
Experimental and theoretical study of incompressible flow around a wing profile with a spoiler. Contributions of laser velocimetry and the Dvorak method [ISL-R-116/84] p 279 N86-19297

**SQUEEZE FILMS**
Equivalent stiffness and damping coefficients for squeeze film dampers p 319 A86-25751

**STABILITY TESTS**
Determination of the service life of aviation oils p 312 A86-23450

**STATIC AERODYNAMIC CHARACTERISTICS**
Effect of sweep angle on static aeroelasticity - Theory for physical meanings p 288 A86-25180

**STATIC ELECTRICITY**
Atmospheric electricity hazards threat environment definition [AD-A159739] p 324 N86-18909

**STATIC TESTS**
Low-speed wind-tunnel investigation of the effect of strakes and nose machines on lateral-directional stability of a fighter configuration [NASA-TM-87641] p 278 N86-19287
Correlation of results of an OH-58A helicopter composite tail boom test with a finite element model [AD-A161062] p 295 N86-19316

**STEADY FLOW**
The effectiveness of various control surfaces in quasi-steady and unsteady flows - Applications [ONERA, TP NO. 1985-147] p 306 A86-24633
Aerodynamics of lifting surfaces in steady flow --- Russian book p 275 A86-25599
A consistent mathematical model to simulate steady and unsteady rotor-blade aerodynamics p 276 A86-26108

**STIFFNESS**
Equivalent stiffness and damping coefficients for squeeze film dampers p 319 A86-25751

**STOCHASTIC PROCESSES**
Optimal control of integral-functional equations p 329 A86-23581
The problem of optimizing the final design modifications of stochastic oscillatory systems p 316 A86-23651

**STRAKES**
Low-speed wind-tunnel investigation of the effect of strakes and nose machines on lateral-directional stability of a fighter configuration [NASA-TM-87641] p 278 N86-19287

**STRATUS CLOUDS**
Calculation of ice accretion on cylindrical rods according to Bain's model, and comparison with experimental results --- stratus clouds [DFVLR-FB-85-46] p 325 N86-18933

**STRESS ANALYSIS**
A theory of large and finite displacements of bars p 316 A86-23662
The finite element stress analysis for solid-shell combined parts in aeroengines [ASME PAPER 85-IGT-72] p 317 A86-23873
The solution of the thermal elastic-plastic problem of turbine disk by the incremental finite element method [ASME PAPER 85-IGT-112] p 317 A86-23909
The development and application of finite element stress analysis techniques at Westland Helicopters Ltd p 330 A86-26118
Fatigue crack propagation under spectrum loading [NAL-TM-MT-8502] p 322 N86-19856

**STRESS CONCENTRATION**
A numerical analysis of singular stress fields at the free edge of layered composites [ONERA, TP NO. 1985-154] p 313 A86-24636

**STRIPPING**
Plastic media blast best for stripping p 269 A86-26274

**STRUCTURAL ANALYSIS**
Correlation of results of an OH-58A helicopter composite tail boom test with a finite element model [AD-A161062] p 295 N86-19316
Application of mathematical optimization procedures to a structural model of a large finite-element wing [NASA-TM-87597] p 322 N86-19661

**STRUCTURAL DESIGN**
Rotorcraft structural dynamic design modifications p 289 A86-26117

**STRUCTURAL DESIGN CRITERIA**
Application of mathematical optimization procedures to a structural model of a large finite-element wing [NASA-TM-87597] p 322 N86-19661

**STRUCTURAL ENGINEERING**
The viscoelastic damping technology design guide for aerospace structures [ASME PAPER 85-DET-104] p 318 A86-24230

**STRUCTURAL FAILURE**
Fiber-reinforced plastic composites for energy absorption purposes p 312 A86-23823
Probabilistic evaluation of individual aircraft tracking techniques [AD-A160146] p 282 N86-18312

**STRUCTURAL RELIABILITY**
Structural airworthiness - A decade of developments p 288 A86-25925

**STRUCTURAL STABILITY**
Control of aeroelastic instabilities through stiffness cross-coupling p 284 A86-23192
Aeromechanical stability analysis of a multirotor vehicle with application to hybrid heavy lift helicopter dynamics p 290 A86-26141

**STRUCTURAL VIBRATION**
Engine/airframe health and usage monitoring an alternate approach via advanced vibration monitoring systems p 296 A86-23255
The problem of optimizing the final design modifications of stochastic oscillatory systems p 316 A86-23651
The forced response of shrouded fan stages [ASME PAPER 85-DET-19] p 303 A86-24226
Interactive modal imaging process for vibrating structures [ASME PAPER 85-DET-110] p 318 A86-24231
Autoparametric vibration of coupled beams under random support motion [ASME PAPER 85-DET-184] p 318 A86-24246
Nonlinear analysis for dynamic behaviours of a coupled rotational vibration system near its critical speed p 291 A86-26143

**STRUCTURAL WEIGHT**
Methods for determining the weight and the center of gravity of aircraft - The platform balance of the Aeronautical Research and Test Institute p 286 A86-23768
The design of an advanced engineering gearbox p 320 A86-26155

**SUBCRITICAL FLOW**
Subsonic wall interference corrections for half-model tests using sparse wall pressure data [LR-616] p 276 N86-18287

**SUBSONIC AIRCRAFT**
Practical difficulties in the theoretical design of low-speed profiles p 271 A86-23775

**SUBSONIC FLOW**
Doublet strip method for oscillating rectangular wings in subsonic flow p 274 A86-25189
Two-dimensional scheme 'DLM-C' to examine subsonic unsteady lifting surface schemes for finite span p 275 A86-25239
On the separated flow over a delta wing at high subsonic and transonic speeds [VTH-M-527] p 279 N86-19293
Aerodynamics of two-dimensional blade-vortex interaction [AD-A160662] p 295 N86-19315

**SUBSONIC WIND TUNNELS**
Future requirements of wind tunnels for aeronautical systems development [AIAA PAPER 86-0751] p 309 A86-24740

**SUPERCOOLING**
Nucleation of ice crystals in supercooled clouds caused by passage of an airplane p 323 A86-26175

**SUPERCRITICAL AIRFOILS**
Analysis of experimental data for a 21% thick natural laminar flow airfoil, NAE68-060-21:1 [NAE-AN-34] p 278 N86-19285

**SUPERCRITICAL WINGS**
Experimental and theoretical study of incompressible flow around a wing profile with a spoiler. Contributions of laser velocimetry and the Dvorak method [ISL-R-116/84] p 279 N86-19297

**SUPERPLASTICITY**
Powdered, sintered alloy materials described: Development of titanium alloys p 314 N86-19447

**SUPERSONIC COMBUSTION RAMJET ENGINES**
A study of ramjet engine. III - Air inlet performance as the engine component p 304 A86-25234

**SUPERSONIC FLIGHT**
Optimal lifting surfaces of wings of complex configurations at supersonic flight velocities p 288 A86-25423

**SUPERSONIC INLETS**
A study of ramjet engine. III - Air inlet performance as the engine component p 304 A86-25234

**SUPERSONIC TRANSPORTS**
Tomorrow . . . Concorde's successor? p 293 A86-26299

**SUPERSONIC WIND TUNNELS**
An estimation of the wall interference on a two-dimensional circulation control airfoil [AIAA PAPER 86-0738] p 273 A86-24732
Future requirements of wind tunnels for aeronautical systems development [AIAA PAPER 86-0751] p 309 A86-24740
Current wind tunnel capability and planned improvements at Lewis Research Center [NASA-TM-87190] p 311 N86-18329

**SUPPORT INTERFERENCE**
Dynamic support interference in high alpha testing --- of aircraft models [AIAA PAPER 86-0760] p 309 A86-24746

**SURFACE FINISHING**
Aviaremont's efforts to introduce laser technology p 320 N86-18286

**SURFACE GEOMETRY**
Surfaces on a nonrectangular frame p 316 A86-23663

**SURFACE NAVIGATION**
USSR report: Transportation [JPRS-UTR-85-015] p 294 N86-18323

**SURFACE ROUGHNESS EFFECTS**
Aerodynamic performances of fabric surface airfoils p 275 A86-25224

**SURVEILLANCE**
Distributed sensor networks [AD-A160596] p 332 N86-19136

**SWEEP ANGLE**
Effect of sweep angle on static aeroelasticity - Theory for physical meanings p 288 A86-25180

**SWEPT FORWARD WINGS**
The role of the Flight Test Department in the development of new technology aircraft p 285 A86-23271

Dynamics and controls flight testing of the X-29A airplane [NASA-TM-86803] p 295 N86-19313

**SWEPT WINGS**
Aerodynamics of swept wings with medium and small aspect ratios. II p 272 A86-23948

**SYNCHROPHASING**
A propeller model for studying trace velocity effects on interior noise p 284 A86-23191

**SYNOPTIC METEOROLOGY**
Some microphysical processes affecting aircraft icing [AD-A160375] p 325 N86-18921

**SYNTHETIC FUELS**
The production of jet fuel from alternate sources [ASME PAPER 85-IGT-67] p 312 A86-23868
Test and evaluation of shale derived jet fuel by the United States Air Force [ASME PAPER 85-IGT-115] p 313 A86-23911

**SYSTEM EFFECTIVENESS**
Flight training simulators. Effects of terrain accuracy on simulated radar image quality [AD-A160905] p 311 N86-18333
A comparative evaluation of the reliability improvement in line replaceable units warranted under the F-16 reliability improvement warranty [AD-A160830] p 321 N86-18630

**SYSTEM FAILURES**
Safety aspects in stores management systems p 299 A86-26132

**SYSTEMS ENGINEERING**
Trends of active control technology p 307 A86-25213

**SYSTEMS INTEGRATION**
Presentation of radar altitude information on the HUD [SAE PAPER 841464] p 298 A86-26007
Development testing of integrated avionics systems using dynamic environment simulation p 330 A86-26166

**SYSTEMS SIMULATION**
Discussion about dynamic simulation test of an aero-engine control system [ASME PAPER 85-IGT-30] p 308 A86-23845

## T

**TAIL ASSEMBLIES**
Comparative analysis of two methods for evaluating the loads acting on the tail plane during a symmetric manoeuvre p 287 A86-25095
An analysis of the influence of the duration and sharpness of a symmetric manoeuvre on the load acting on the tail plane p 287 A86-25096
Resonance fatigue test of the empennage of a CT4 aircraft [AD-A160749] p 294 N86-18321
Correlation of results of an OH-58A helicopter composite tail boom test with a finite element model [AD-A161062] p 295 N86-19316

**TAKEOFF**
Aeroacoustics of an advanced propeller design under takekoff and landing conditions p 284 A86-23190

**TAPE RECORDERS**
Magnetic tape recording under severe environmental conditions p 314 A86-22716
Airborne instrumentation magnetic tape recording thru the early 90's p 315 A86-23253

**TAPERING**
Distribution of optimal circulation on a propeller blade with a nonlinear dependence on the number of blades and with allowance tapering p 271 A86-23778

**TARGET RECOGNITION**
Performance of resonant radar target identification algorithms using intra-class weighting functions p 321 N86-19490

**TARGETS**
Distributed sensor networks [AD-A160596] p 332 N86-19136

**TASK COMPLEXITY**
Automation in the cockpit - Who's in charge? [SAE PAPER 841534] p 327 A86-26005

**TAXIING**
New nose-in aircraft guidance/docking system developed p 308 A86-23380

**TECHNOLOGICAL FORECASTING**
Future requirements of wind tunnels for aeronautical systems development [AIAA PAPER 86-0751] p 309 A86-24740
One man and 3,000 million operations a second - Preparing for the LHX cockpit p 286 A86-24988
Impact of advanced technology on future helicopter preliminary design p 290 A86-26126
Tomorrow . . . Concorde's successor? p 293 A86-26299

**TECHNOLOGY ASSESSMENT**
Airborne radar. I - Air-to-surface p 296 A86-23293
Winging it in the 1980's - Why guidelines are needed for cockpit automation [SAE PAPER 841634] p 328 A86-26022
T700 - A program designed for early maturity and growth potential p 305 A86-26156

**TECHNOLOGY UTILIZATION**
Current concepts of composite applications in aircraft and engines p 312 A86-23690
The possibility of using the on-board computer for in-flight diagnostics p 297 A86-23765

**TELEMETRY**
Advanced medium scale real-time system --- for evaluation of flight tests p 296 A86-22720
The telemetry system of the DFVLR experimental aircraft ATTAS p 281 A86-22729
Telemetry system prototype development --- for Naval aircraft flight tests p 281 A86-23268

**TEMPERATURE CONTROL**
Low cost thermal control for flight test laser radar [SAE PAPER 851321] p 265 A86-23511
HC-Mk1 (Chinook) heated rotor blade icing test. I - Test vehicle, test site, approach and summary of testing p 293 A86-26167

**TEMPERATURE MEASUREMENT**
Comparison of sea surface temperatures obtained from an aircraft using remote and direct sensing techniques p 323 A86-23291
Measurement of turbine blade temperature using pyrometer [ASME PAPER 85-IGT-78] p 317 A86-23879

**TERRAIN ANALYSIS**
Flight training simulators. Effects of terrain accuracy on simulated radar image quality [AD-A160905] p 311 N86-18333

**TEST EQUIPMENT**
Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings p 284 A86-23252
Development of autonomous power system testbed p 311 A86-24841

**TEST FACILITIES**
Methods for determining the weight and the center of gravity of aircraft - The platform balance of the Aeronautical Research and Test Institute p 286 A86-23768
Development testing of integrated avionics systems using dynamic environment simulation p 330 A86-26166
Aeronautical facilities catalogue. Volume 2: Airbreathing propulsion and flight simulators [NASA-RP-1133] p 311 N86-18328

**TEST PILOTS**
A preliminary flight evaluation of the peripheral vision display using the NT-33A aircraft p 297 A86-23729

**TESTS**
Testability of aircraft p 269 A86-23760

**TF-34 ENGINE**
Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model [AIAA PAPER 86-0780] p 286 A86-24759

**THERMAL ANALYSIS**
HC-Mk1 (Chinook) heated rotor blade icing test. II - Analysis of atomospheric conditions, aircraft and systems characteristics p 293 A86-26168

**THERMAL MAPPING**
Inflight resolution evaluation for thermal imaging systems p 296 A86-23272

**THERMAL STABILITY**
Fire-retardant decorative inks for aircraft interiors [NASA-TM-88198] p 313 N86-18441

**THERMAL STRESSES**
The solution of the thermal elastic-plastic problem of turbine disk by the incremental finite element method [ASME PAPER 85-IGT-112] p 317 A86-23909

**THIN WINGS**
Numerical simulation of leading-edge vortex flows p 270 A86-23133
Optimal lifting surfaces of wings of complex configurations at supersonic flight velocities p 288 A86-25423

**THREE DIMENSIONAL FLOW**
Parametric determination of lift interference for three-dimensional models in the Emmen (Switzerland) aircraft works wind tunnel [F+W-FO-1740] p 277 N86-18304
Microburst wind shear models from the Joint Airport Weather Studies (JAWS) [AD-A159758] p 324 N86-18910
Generation of the starting plane flowfield for supersonic flow over a spherically capped body [AD-A161117] p 278 N86-19291

**THRUST CONTROL**
An investigation of the use of bandwidth criteria for rotorcraft handling-qualities specifications [AD-A160664] p 294 N86-18319

**THUNDERSTORMS**
Joint agency turbulence experiment [AD-A160420] p 325 N86-18924

**TIME LAG**
Comparison of pilot effective time delay for cockpit controllers used on space shuttle and conventional aircraft [NASA-TM-86030] p 307 N86-19324
Study on the digital position transducer with optical time-delay pulse [NAS-TR-878] p 322 N86-19583

**TIME SERIES ANALYSIS**
Composite statistical method for modeling wind gusts p 308 A86-23189
In-flight turbulence detection [AD-A160380] p 325 N86-18923

**TIMOSHENKO BEAMS**
A theory of large and finite displacements of bars p 316 A86-23662

**TIP SPEED**
Laboratory experiments on active suppression of advanced turboprop noise [NASA-TM-87129] p 331 N86-19125

**TITANIUM ALLOYS**
A survey of accelerated vibratory fatigue test method of aero-engine compressor blade [ASME PAPER 85-IGT-105] p 317 A86-23904
Powdered, sintered alloy materials described: Development of titanium alloys p 314 N86-19447
Fundamental investigation on the impact strength of hollow fan blades [NAL-TR-879] p 322 N86-19657

**TOLERANCES (PHYSIOLOGY)**
B-52G crew noise exposure study [AD-A161112] p 333 N86-20094

**TOW MISSILES**
Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed [AD-A160862] p 294 N86-18322

**TOWED BODIES**
Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed [AD-A160862] p 294 N86-18322

**TRACKING (POSITION)**
Probabilistic evaluation of individual aircraft tracking techniques [AD-A160146] p 282 N86-18312
High dynamic GPS receiver validation demonstration [NASA-CR-176530] p 283 N86-19306

**TRACKING NETWORKS**
Distributed sensor networks [AD-A160596] p 332 N86-19136

**TRACKING RADAR**
Calibration of an on-ground aircraft tracking radar by aerial photogrammetry [NAL-TR-861] p 282 N86-18311

**TRAILING EDGE FLAPS**
Means to increase the lift on aircraft wing profiles p 271 A86-23776
Studies of the aerodynamics of flaps and spoilers in unsteady flow [ONERA, TP NO. 1985-149] p 272 A86-24627

**TRAINING AIRCRAFT**
Resonance fatigue test of the empennage of a CT4 aircraft [AD-A160749] p 294 N86-18321

**TRAINING ANALYSIS**
Flight training simulators. Effects of terrain accuracy on simulated radar image quality [AD-A160905] p 311 N86-18333

**TRAINING SIMULATORS**
Wide-angle, low-altitude flight simulator vision system - for cockpit research and aircrew training p 311 A86-26152

**TRAJECTORY MEASUREMENT**
The data transmission and processing equipment of a high-precision trajectory measurement system p 296 A86-22728

**TRANSATMOSPHERIC VEHICLES**
High speed aeronautics [GPO-51-341] p 278 N86-19284

**TRANSDUCERS**
Study on the digital position transducer with optical time-delay pulse [NAS-TR-878] p 322 N86-19583

**TRANSFER FUNCTIONS**
Aerodynamic transfer functions for a finite wing in incompressible flow [NAL-TR-867] p 278 N86-19286

**TRANSONIC FLOW**
Development of numerical methods of external high-speed aerodynamics p 271 A86-23777

**WIND TUNNEL STABILITY TESTS**
The role of wind tunnel testing in future aircraft development
[AIAA PAPER 86-0750] p 309 A86-24739

**WIND TUNNEL TESTS**
Wind tunnel wall influence considering two-dimensional high-lift configurations p 308 A86-23187
Post stall studies of untwisted varying aspect ratio blades with NACA 44XX series. II - Airfoil sections p 272 A86-24522
Studies of the aerodynamics of flaps and spoilers in unsteady flow
[ONERA, TP NO. 1985-149] p 272 A86-24627
Optical fibers application to visualization of flow separation inside an aircraft intake in wind tunnel
[ONERA, TP NO. 1985-158] p 309 A86-24638
Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers p 309 A86-24726
Aerodynamic performance of two fifteen-percent-scale wind-tunnel drive fan designs
[AIAA PAPER 86-0734] p 273 A86-24729
Aeroelastic oscillations caused by transitional boundary layers and their attenuation
[AIAA PAPER 86-0736] p 286 A86-24731
An estimation of the wall interference on a two-dimensional circulation control airfoil
[AIAA PAPER 86-0738] p 273 A86-24732
Future requirements of wind tunnels for aeronautical systems development
[AIAA PAPER 86-0751] p 309 A86-24740
Future requirements of wind tunnels for CFD code verification
[AIAA PAPER 86-0753] p 309 A86-24742
Some lessons learned with wind tunnels
[AIAA PAPER 86-0777] p 310 A86-24756
An experimental study of a high performance canard airfoil with boundary layer trip and vortex generators
[AIAA PAPER 86-0781] p 273 A86-24760
The accuracy problem of airplane development force testing in cryogenic wind tunnels
[AIAA PAPER 86-0776] p 310 A86-24765
Tests on a new dynamically scaled model rotor in the RAE 24 ft Wind Tunnel p 292 A86-26162
Design and testing of a large scale helicopter fuselage model in the RAE 5 metre pressurized wind tunnel p 292 A86-26163
Subsonic wall interference corrections for half-model tests using sparse wall pressure data
[LR-616] p 276 N86-18287
Parametric determination of lift interference for three dimensional models in the Emmen (Switzerland) aircraft works wind tunnel
[F+W-FO-1740] p 277 N86-18304
Current wind tunnel capability and planned improvements at Lewis Research Center
[NASA-TM-87190] p 311 N86-18329
Analysis of experimental data for a 21% thick natural laminar flow airfoil, NAE68-060-21:1
[NAE-AN-34] p 278 N86-19285
Low-speed wind-tunnel investigation of the effect of strakes and nose machines on lateral-directional stability of a fighter configuration
[NASA-TM-87641] p 278 N86-19287
On the separated flow over a delta wing at high subsonic and transonic speeds
[VTH-M-527] p 279 N86-19293
Experimental and theoretical study of incompressible flow around a wing profile with a spoiler. Contributions of laser velocimetry and the Dvorak method
[ISL-R-116/84] p 279 N86-19297

**WIND TUNNEL WALLS**
Wind tunnel wall influence considering two-dimensional high-lift configurations p 308 A86-23187
An estimation of the wall interference on a two-dimensional circulation control airfoil
[AIAA PAPER 86-0738] p 273 A86-24732
Subsonic wall interference corrections for half-model tests using sparse wall pressure data
[LR-616] p 276 N86-18287

**WIND TUNNELS**
Calculation of helicopter airfoil characteristics for high tip-speed applications
[AD-A160694] p 277 N86-18294

**WIND TURBINES**
Dynamic response of windturbine to yawed wind p 323 A86-26140
Design method for the calculation of performances and flap movement of flexible wind turbine blades
[VTH-M-453] p 323 N86-18795

**WIND VARIATIONS**
Studies of the aerodynamics of flaps and spoilers in unsteady flow
[ONERA, TP NO. 1985-149] p 272 A86-24627

**WING CAMBER**
Means to increase the lift on aircraft wing profiles p 271 A86-23776

**WING LOADING**
Some calculations of tip vortex - Blade loadings p 276 A86-26107

**WING OSCILLATIONS**
Comparative measurements of the unsteady pressures and the tip-vortex parameters on four oscillating wing tip models p 273 A86-24708
Aeroelastic oscillations caused by transitional boundary layers and their attenuation
[AIAA PAPER 86-0736] p 286 A86-24731
Energetics and optimum motion of oscillating lifting surfaces of finite span p 274 A86-25084
Effect of sweep angle on static aeroelasticity - Theory for physical meanings p 288 A86-25180
Improved doublet lattice method for oscillating swept tapered wings in incompressible flow p 274 A86-25200
A study on the propulsive force of wings in non-steady motion by the theorem of momentum p 275 A86-25233
Two-dimensional scheme 'DLM-C' to examine subsonic unsteady lifting surface schemes for finite span p 275 A86-25239
Comparative measurements of the unsteady pressures and the tip-vortex parameters of four oscillating wing tip models p 276 A86-26109

**WING PROFILES**
Means to increase the lift on aircraft wing profiles p 271 A86-23776
Optimal lifting surfaces of wings of complex configurations at supersonic flight velocities p 288 A86-25423

**WING SPAN**
Two-dimensional scheme 'DLM-C' to examine subsonic unsteady lifting surface schemes for finite span p 275 A86-25239

**WING TIP VORTICES**
Airfoil tip vortex formation noise p 331 A86-23134
Comparative measurements of the unsteady pressures and the tip-vortex parameters on four oscillating wing tip models p 273 A86-24708
Some calculations of tip vortex - Blade loadings p 276 A86 26107
Comparative measurements of the unsteady pressures and the tip-vortex parameters of four oscillating wing tip models p 276 A86-26109
Theoretical prediction of running-time measurements in unsteady flow — for various shapes of rotor blade tips p 276 A86-26112

**WINGED VEHICLES**
On hypersonic flow around winged-vehicles at high angles of attack p 275 A86-25227

**WINGS**
The A320 wing - Designing for commercial success p 286 A86-23799
Navier-Stokes solutions using finite volume procedures p 274 A86-25005
The laminar wing - A way for improving the economy of commercial aircraft p 274 A86-25022
Doublet strip method for oscillating rectangular wings in subsonic flow p 274 A86-25189
Aerodynamic performances of fabric surface airfoils p 275 A86-25224
Application of mathematical optimization procedures to a structural model of a large finite-element wing
[NASA-TM-87597] p 322 N86-19661

**WINTER**
The aircraft icing environment in wintertime, low ceiling conditions
[AD-A160578] p 280 N86-18307

**WORKLOADS (PSYCHOPHYSIOLOGY)**
Longitudinal flying qualitites criteria for single-pilot instrument flight operations p 305 A86-23186
AI applications to military pilot decision aiding - A perspective on transition
[SAE PAPER 841533] p 327 A86-26004
A review of pilot workload measurement techniques used on the A-10 single seat night attack test program
[SAE PAPER 841492] p 327 A86-26016
Effects of digital altimetry on pilot workload
[SAE PAPER 841489] p 327 A86-26019
U.S. Army helicopter voice technology applications
[SAE PAPER 841609] p 328 A86-26028
Effects of noise and workload on a communication task
[AD-A160743] p 321 N86-18599

## X

**X-29 AIRCRAFT**
The role of the Flight Test Department in the development of new technology aircraft p 285 A86-23271
Dynamics and controls flight testing of the X-29A airplane
[NASA-TM-86803] p 295 N86-19313

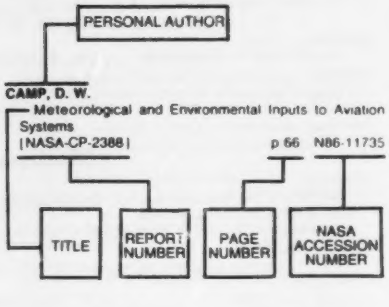
## Y

**YAW**
An investigation of the use of bandwidth criteria for rotorcraft handling-qualities specifications
[AD-A160664] p 294 N86-18319

**YAWING MOMENTS**
Problems in rudder design for small transport aircraft p 306 A86-23781

# PERSONAL AUTHOR INDEX

### Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**ABE, T.**
Experimental study of the effects on the turbofan engine by the distortion p 304 A86-25192
An analytical method of the characteristics of the turbofan engine components p 304 A86-25201

**ADAMS, T.**
Development of autonomous power system testbed p 311 A86-24841

**AGRESTI, W. W.**
An approach to developing specification measures p 330 N86-19968

**AHMADI, A. R.**
Energetics and optimum motion of oscillating lifting surfaces of finite span p 274 A86-25084

**AIKEN, E. W.**
Aircrew-aircraft integration - A summary of U.S. Army research programs and plans p 310 A86-26149

**AMINOV, A. B.**
Liapunov function for studying the stability in the whole of nonlinear systems p 331 A86-23576

**AMORETTI, J. B.**
New nose-in aircraft guidance/docking system developed p 308 A86-23380

**ANDERS, G.**
The effectiveness of various control surfaces in quasi-steady and unsteady flows - Applications
[ONERA, TP NO. 1985-147] p 306 A86-24633

**ANDERSON, I.**
Resonance fatigue test of the empennage of a CT4 aircraft
[AD-A160749] p 294 N86-18321

**ANDERSON, R. L.**
Small stone impact testing p 279 A86-23020

**ANDES,W. S.**
The HUD as a primary flight instrument
[SAE PAPER 841463] p 298 A86-26006

**ANDO, S.**
Effect of sweep angle on static aeroelasticity - Theory for physical meanings p 268 A86-25180
Two-dimensional scheme 'DLM-C' to examine subsonic unsteady lifting surface schemes for finite span p 275 A86-25239
Aerodynamic characteristics of slender wing-gap-body combinations. II p 275 A86-25240

**ANDRIANO, M.**
Computer controlled variable pressure reducing/shut-off valve for aircraft ECS
[SAE PAPER 851360] p 285 A86-23545

**ANIBLE, F. R.**
An electronic index of articles pertaining to Air Force transportation in the post-World War 2 era, with abstracts of selected articles
[AD-A160837] p 281 N86-18308

**ANQUEZ, L.**
A numerical analysis of singular stress fields at the free edge of layered composites
[ONERA, TP NO. 1985-154] p 313 A86-24636

**ANTROPIUS, K.**
A holographic study of the vibrational modes of aircraft engine rotors p 301 A86-23756

**ARCARI, C.**
Manufacturing control over the reproduction of high integrity parts - A way to improve the safety of aeronautical products p 320 A86-26122

**ARETZ, A. J.**
Cockpit automation technology p 326 A86-23724

**ARINCHEV, S. V.**
The problem of optimizing the final design modifications of stochastic oscillatory systems p 316 A86-23651

**ARPASI, D. J.**
Partitioning and packing mathematical simulation models for calculation on parallel computers
[NASA-TM-87170] p 330 N86-19006

**ASHILL, P. R.**
Aeroelastic oscillations caused by transitional boundary layers and their attenuation
[AIAA PAPER 86-0736] p 286 A86-24731

**ASTRIDGE, D. G.**
The health and usage monitoring system of the Westland 30 series 300 helicopter p 299 A86-26153

**AUDONE, B.**
Antenna siting on helicopters p 282 A86-26133

**AZUMA, A.**
Dynamic response of windturbine to yawed wind p 323 A86-26140

## B

**BACHEV, N. L.**
Calculation of the heating of a liquid component partially filling a container p 316 A86-23653

**BACK, R. F.**
The A320 wing - Designing for commercial success p 286 A86-23799

**BAEDER, J. D.**
Calculation of helicopter airfoil characteristics for high tip-speed applications
[AD-A160694] p 277 N86-18294
Aerodynamics of two-dimensional blade-vortex interaction
[AD-A160662] p 295 N86-19315

**BAKER, J. L.**
Mode-S beacon system to cover all U.S. upper airspace by 1991 p 281 A86-23376

**BAKKER, P. G.**
On the separated flow over a delta wing at high subsonic and transonic speeds
[VTH-M-527] p 279 N86-19293

**BAKUNIN, V. N.**
Determination of the service life of aviation oils p 312 A86-23450

**BALTAS, N.**
Some calculations of tip vortex - Blade loadings p 276 A86-26107

**BALVERS, H. S. M.**
Corrosion protection of helicopters through organic coatings p 313 A86-26159

**BANAL, F.**
A first step for reducing helicopter IFR approach minima Agusta A109 IFR CAT II certification p 280 A86-26127

**BA[illegible]NIK, W. J.**
On the separated flow over a delta wing at high subsonic and transonic speeds
[VTH-M-527] p 279 N86-19293

**BAR-GILL, A.**
Longitudinal flying qualitites criteria for single-pilot instrument flight operations p 305 A86-23186

**BARBARO, A.**
Remote sensing of oil on sea: Lidar and passive IR experiments p 320 N86-18370

**BARKER, J. C.**
Some thoughts on the vibration testing of helicopter equipment in the UK p 283 A86-23022

**BARON, A.**
Three component hot-wire measurements in the wake of a rotor model p 320 A86-26111

**BARREAU, R.**
The effectiveness of various control surfaces in quasi-steady and unsteady flows - Applications
[ONERA, TP NO. 1985-147] p 306 A86-24633

**BARRER, J. N.**
Potential applications of multiple instrument approach concepts at 101 U.S. Airports
[AD-A161155] p 283 N86-19308

**BARTON, J. R.**
Development of autonomous power system testbed p 311 A86-24841

**BASS, M. D.**
Results of high angle-of-attack testing of the F-15 with conformal fuel tanks p 284 A86-23267

**BEARDMORE, P.**
Fiber-reinforced plastic composites for energy absorption purposes p 312 A86-23823

**BEHLKE, R. F.**
The development of a second-generation of Controlled Diffusion Airfoils for multistage compressors
[ASME PAPER 85-IGT-9] p 271 A86-23830

**BELIKOV, V.**
Sukhoy design bureau builds sport plane made of plastic p 294 N86-18324

**BENDA, J.**
The measuring and control units of airborne recording systems p 297 A86-23763

**BERAK, P.**
Practical difficulties in the theoretical design of low-speed profiles p 271 A86-23775

**BERENSCHOT, G. H.**
Calculation of the external nacelle surface for single and double stream jet engines for civil aircraft
[VTH-M-445] p 277 N86-18301

**BERESTOV, L. M.**
Frequency methods of aircraft identification p 306 A86-24148

**BERRY, D. T.**
Comparison of pilot effective time delay for cockpit controllers used on space shuttle and conventional aircraft
[NASA-TM-86030] p 307 N86-19324

**BERTLING, S. J.**
A study of programmable switch symbology p 329 A86-23708

**BIELAK, J.**
The forced response of shrouded fan stages
[ASME PAPER 85-DET-19] p 303 A86-24226

**BIGLIETTO, C.**
Manufacturing control over the reproduction of high integrity parts - A way to improve the safety of aeronautical products p 320 A86-26122

**BIL, C.**
An introduction to the application of Computer Aided Design (CAD) to the predesign of aircraft and the design of aircraft structures at the Aerospace Section
[VTH-M-512] p 330 N86-19045

**BION, J.-B.**
Optical fibers application to visualization of flow separation inside an aircraft intake in wind tunnel
[ONERA, TP NO. 1985-158] p 309 A86-24638

**BIVENS, C. C.**
An investigation of the use of bandwidth criteria for rotorcraft handling-qualities specifications
[AD-A160664] p 294 N86-18319

**BLANKEN, C. L.**
An investigation of the use of bandwidth criteria for rotorcraft handling-qualities specifications
[AD-A160664] p 294 N86-18319

**BLOM, J. J. H.**
The conformal representation of the NACA 642A015 profile
[VTH-M-502] p 277 N86-18296
On the longest chord of the first Muller profile
[VTH-M-496] p 277 N86-18303

**BOHNE, A. R.**
In-flight turbulence detection
[AD-A160380] p 325 N86-18923
Joint agency turbulence experiment
[AD-A160420] p 325 N86-18924

**BOJANOWSKI, J.**
Comparative analysis of two methods for evaluating the loads acting on the tail plane during a symmetric manoeuvre p 287 A86-25095

**BOLOGNA, G.**
The project for anti-tank helicopter
p 290 A86-26124

**BONAITA, G.**
Optimum helicopter in the flight spectrum
p 290 A86-26123

**BOPPE, C. W.**
Future requirements of wind tunnels for CFD code verification
[AIAA PAPER 86-0753] p 309 A86-24742

**BORST, H. V.**
Aerodynamic performance of two fifteen-percent-scale wind-tunnel drive fan designs
[AIAA PAPER 86-0734] p 273 A86-24729

**BOTHE, H.**
The telemetry system of the DFVLR experimental aircraft ATTAS p 281 A86-22729

**BOUGHTON, W. G.**
Electrical connections and antenna performance of a large composite fuselage module in the high frequency range p 292 A86-26157

**BOUTIER, A.**
Measurements accuracy with 3D laser velocimetry
[ONERA, TO NO. 1985-171] p 318 A86-24646

**BOUWER, G.**
DFVLR helicopter in-flight simulator for flying quality research p 310 A86-26148

**BOWDITCH, D. N.**
Current wind tunnel capability and planned improvements at Lewis Research Center
[NASA-TM-87190] p 311 N86-18329

**BOWER, J. N.**
The F-16XL flight test program p 264 A86-23260

**BOYD, D. I.**
Development of a new technology small fan jet engine
[ASME PAPER 85-IGT-139] p 303 A86-23931

**BRAGG, M. G.**
An experimental study of a high performance canard airfoil with boundary layer trip and vortex generators
[AIAA PAPER 86-0781] p 273 A86-24760

**BRANDON, J. M.**
Low-speed wind-tunnel investigation of the effect of strakes and nose machines on lateral-directional stability of a fighter configuration
[NASA-TM-87641] p 278 N86-19287

**BREEMAN, J. H.**
Determination of performance and stability characteristics from dynamic maneuvers with a transport aircraft using parameter identification techniques
[NLR-MP-84024-U] p 308 N86-19326

**BRENNOM, T. R.**
Unscreened part reliability rivals that of screened parts in new digital avionics p 315 A86-23015

**BRIDEL, G.**
Performance computation of turbofan and turbojet engines in off-design conditions
[F+W-FO-1746] p 305 N86-19323

**BRIDGEMAN, J. O.**
Calculation of helicopter airfoil characteristics for high tip-speed applications
[AD-A160694] p 277 N86-18294

**BRINES, G. L.**
Design approach for an optimum prop-fan propulsion system
[ASME PAPER 85-IGT-57] p 301 A86-23861

**BRINKLEY, J. W.**
Effect of seat cushions of human respone to +Gz impact p 326 A86-25652

**BRISTOW, J. W.**
Structural airworthiness - A decade of developments
p 288 A86-25925
Airworthiness aspects of fatigue in helicopters
p 280 A86-26128

**BROCKHAUS, R.**
Proposal for the choice of state variables for equations of motion of aircraft in moving air p 306 A86-24588

**BROOKS, T. F.**
Airfoil tip vortex formation noise p 331 A86-23134

**BROWN, E. M.**
An overview of civil helicopter operations - Past, present and future p 279 A86-23800

**BRUNS, A.**
Low cost thermal control for flight test laser radar
[SAE PAPER 851321] p 285 A86-23511

**BUCK, M. L.**
Future requirements of wind tunnels for aeronautical systems development
[AIAA PAPER 86-0751] p 309 A86-24740

**BUCKLEY, J. J.**
Modular air shut-off valve
[AD-D011935] p 321 N86-18728

**BULLINGTON, J. B.**
Plastic media blast best for stripping
p 269 A86-26274

**BURGER, K.-H.**
Economical in-flight calibration of air data sensors using inertial navigation units as reference
p 284 A86-23270

**BURKHARD, A. H.**
Evolution of emerging environmental testing and evaluation techniques p 315 A86-23011

**BUSCARELLO, F. L.**
The new environmental control system for the B-52 G/H aircraft
[SAE PAPER 851320] p 285 A86-23510

**BYRAM, K. V.**
Mode-S beacon system to cover all U.S. upper airspace by 1991 p 281 A86-23376

**BYRNE, F.**
Video processor for air traffic control beacon system
[NASA-CASE-KSC-11155-1] p 283 N86-19304

**BYSTROV, V. V.**
The problem of optimizing the final design modifications of stochastic oscillatory systems p 316 A86-23651

## C

**CALAPODAS, N.**
Correlation of results of an OH-58A helicopter composite tail boom test with a finite element model
[AD-A161062] p 295 N86-19316

**CALDWELL, A. E.**
A computer based study of helicopter agility, including the influence of an active tailplane p 291 A86-26146

**CALMON, L. C.**
Prediction and measurement of near fields for antennas on structures p 316 A86-23403

**CANSDALE, J. T.**
Tests on a new dynamically scaled model rotor in the RAE 24 ft Wind Tunnel p 292 A86-26162

**CAPDEVIELLE, J.-N.**
Analysis of gamma ray families and jets up to 10 to the 7th GeV obtained during 1000 hours exposure of emulsion chambers on the Concorde
p 333 A86-22863

**CAPECE, V.**
Stator row unsteady aerodynamics due to wake excitations p 273 A86-24703

**CAPITAINE, G.**
Parametric determination of lift interference for three-dimensional models in the Emmen (Switzerland) aircraft works wind tunnel
[F+W-FO-1740] p 277 N86-18304

**CARADONNA, F. X.**
An experimental investigation of the parallel blade-vortex interaction p 276 A86-26106

**CARR, E.**
Further applications of the Lucas fan spray fuel injection combustion system
[ASME PAPER 85-IGT-116] p 302 A86-23912

**CARR, L. A.**
Presentation of radar altitude information on the HUD
[SAE PAPER 841464] p 298 A86-26007

**CARR, M. I.**
Excitation of blade vibration by flow induced acoustic resonances in axial-flow compressors
p 303 A86-24712

**CASTAGNOLI, F.**
Remote sensing of oil on sea: Lidar and passive IR experiments p 320 N86-18370

**CECCHI, G.**
Remote sensing of oil on sea: Lidar and passive IR experiments p 320 N86-18370

**CERIOTTI, A.**
Analytical and experimental results of the ground resonance phenomenon for A.129 p 291 A86-26142

**CHANG, H. P.**
Microburst wind shear models from the Joint Airport Weather Studies (JAWS)
[AD-A159758] p 324 N86-18910

**CHANG, O.**
The solution of the thermal elastic-plastic problem of turbine disk by the incremental finite element method
[ASME PAPER 85-IGT-112] p 317 A86-23909

**CHEN, F.**
An experimental investigation of response of a turbojet engine to inlet distortion
[ASME PAPER 85-IGT-12] p 301 A86-23832

**CHEN, J. S.**
Comparison of two target classification techniques
p 318 A86-23951

**CHENG, H.**
Measurement of turbine blade temperature using pyrometer
[ASME PAPER 85-IGT-78] p 317 A86-23879

**CHENG, Y. P.**
Rotorcraft structural dynamic design modifications
p 289 A86-26117

**CLARKE, J.**
Airborne radar. I - Air-to-surface p 296 A86-23293

**CLER, A.**
Recent advances in helicopter aerodynamics
[ONERA, TP NO. 1985-166] p 273 A86-24642

**COCKING, H.**
The design of an advanced engineering gearbox
p 320 A86-26155

**COENE, R.**
Elements of the aerodynamic theory of cyclogyro wing systems with concentrator effects
[VTH-LR-338] p 279 N86-19294

**COGGESHALL, R. L.**
The 737 graphite composite flight spoiler flight service evaluation
[NASA-CR-172600] p 314 N86-18448
Environmental exposure effects on composite materials for commercial aircraft
[NASA-CR-177329] p 314 N86-18449

**COHEN, I. D.**
Some microphysical processes affecting aircraft icing
[AD-A160375] p 325 N86-18921

**COHEN, S.**
Fuel deposit characteristics at low velocity
[ASME PAPER 85-IGT-130] p 313 A86-23922

**CONG, M.**
An experimental investigation of response of a turbojet engine to inlet distortion
[ASME PAPER 85-IGT-12] p 301 A86-23832

**COOLEY, W. W.**
Atmospheric electricity hazards threat environment definition
[AD-A159739] p 324 N86-18909

**CORMERY, G.**
Tomorrow . . . Concorde's successor?
p 293 A86-26299

**CORSENTINO, D. L.**
A flight evaluation of a digital electronic engine control
p 299 A86-23273

**CORT, A.**
Wide-angle, low-altitude flight simulator vision system for cockpit research and aircrew training
p 311 A86-26152

**COSTES, M.**
Studies of the aerodynamics of flaps and spoilers in unsteady flow
[ONERA, TP NO. 1985-149] p 272 A86-24627

**COUPRY, G.**
Progress in the analysis of atmospheric turbulence
[ONERA, TP NO. 1985-164] p 323 A86-24631

**COX, T. H.**
Ground vibration test results for Drones for Aerodynamic and Structural Testing (DAST)/Aeroelastic Research Wing (ARW-1R) aircraft
[NASA-TM-85906] p 294 N86-19312

**CRAIG, J. I.**
Rotorcraft structural dynamic design modifications
p 289 A86-26117

**CRANE, P. M.**
Flight training simulators. Effects of terrain accuracy on simulated radar image quality
[AD-A160905] p 311 N86-18333

**CRESPI, M.**
Optimum helicopter in the flight spectrum
p 290 A86-26123

**CRISPOLTI, F.**
Safety aspects in stores management systems
p 299 A86-26132

**CRITES, C. D.**
A review of pilot workload measurement techniques used on the A-10 single seat night attack test program
[SAE PAPER 841492] p 327 A86-26016

Comparison of sea surface temperatures obtained from an aircraft using remote and direct sensing techniques
p 323 A86-23291

**WONG, H. Y.**
Investigation into the cause of failure of a turboprop impeller in service
[ASME PAPER 85-IGT-147] p 303 A86-23938

**WOOD, N. J.**
An estimation of the wall interference on a two-dimensional circulation control airfoil
[AIAA PAPER 86-0738] p 273 A86-24732

**WOOD, P. C.**
The development and application of finite element stress analysis techniques at Westland Helicopters Ltd
p 330 A86-26118

**WOODSON, B. K.**
A study of programmable switch symbology
p 329 A86-23708

**WU, C. H.**
Discussion about dynamic simulation test of an aero-engine control system
[ASME PAPER 85-IGT-30] p 308 A86-23845

**WU, T.-Y.**
A survey of accelerated vibratory fatigue test method of aero-engine compressor blade
[ASME PAPER 85-IGT-105] p 317 A86-23904

## X

**XIAO, S.**
The study of adaptive control augmentation system implemented with microcomputer p 306 A86-24577

**XIE, Q. M.**
Aerodynamic research on straight wall annular diffuser for turbofan augmentor
[ASME PAPER 85-IGT-16] p 271 A86-23834

**XU, J.**
Prediction of blade flutter in a tuned rotor
[ASME PAPER 85-IGT-100] p 302 A86-23899

## Y

**YAMAMOTO, Y.**
Aerodynamic characteristics of slender wing-gap-body combinations. II p 275 A86-25240

**YAMAUCHI, G. K.**
Applications of an analysis of axisymmetric body effects on rotor performance and loads p 289 A86-26105

**YAMAZAKI, M.**
Powdered, sintered alloy materials described: Development of titanium alloys p 314 N86-19447

**YAN, Q.**
Convergence of performance calculation of twin spool turbojet and turbofan
[ASME PAPER 85-IGT-82] p 302 A86-23883

**YASUHARA, M.**
On hypersonic flow around winged-vehicles at high angles of attack p 275 A86-25227

**YAZAWA, K.**
Calibration of an on-ground aircraft tracking radar by aerial photogrammetry
[NAL-TR-861] p 282 N86-18311

**YIN, J.**
The finite element stress analysis for solid-shell combined parts in aeroengines
[ASME PAPER 85-IGT-72] p 317 A86-23873

**YIN, Z.**
The finite element stress analysis for solid-shell combined parts in aeroengines
[ASME PAPER 85-IGT-72] p 317 A86-23873

**YOSHIKAMI, S. A.**
Flight operations noise tests of eight helicopters
[AD-A159835] p 331 N86-19127

**YOSHINAKA, T.**
A cost-effective performance development of the PT6A-65 turboprop compressor
[ASME PAPER 85-IGT-41] p 301 A86-23853

## Z

**ZANETTI, G.**
A first step for reducing helicopter IFR approach minima Agusta A109 IFR CAT II certification
p 280 A86-26127

**ZAVA, M.**
Simulation concepts and testing of the tail rotor fly-by-wire system of the A129 helicopter
p 292 A86-26165

**ZELLER, A. F.**
The decision to fly
[SAE PAPER 841613] p 328 A86-26024

**ZHANG, J.**
Rapid calculation of engine performance
[ASME PAPER 85-IGT-83] p 302 A86-23884

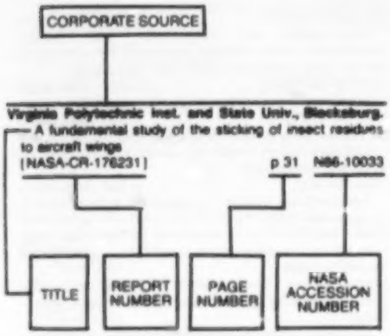
**ZHU, S.**
Automatic landing through the turbulent planetary boundary layer
[UTIAS-289] p 283 N86-19305

**ZHU, X.**
Convergence of performance calculation of twin spool turbojet and turbofan
[ASME PAPER 85-IGT-82] p 302 A86-23883
Rapid calculation of engine performance
[ASME PAPER 85-IGT-83] p 302 A86-23884

**ZIGO, A.**
A possible approach to the diagnostics of the hydraulic servomechanism of the aircraft control system
p 285 A86-23757

# CORPORATE SOURCE INDEX

## Typical Corporate Source Index Listing



CORPORATE SOURCE
Virginia Polytechnic Inst. and State Univ., Blacksburg.
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231]
p 31
N86-10033
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

**Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).**
Technical evaluation report on the Fluid Dynamics Panel Symposium on Aerodynamics and Acoustics of Propellers
[AGARD-AR-213] p 279 N86-19298
Transonic unsteady aerodynamics and its aeroelastic applications
[AGARD-CP-374-ADD-1] p 279 N86-19299

**Aeronautical Research Labs., Melbourne (Australia).**
The test loads sequences applied to the CT4 full scale fatigue test
[AD-A160736] p 294 N86-18320
Resonance fatigue test of the empennage of a CT4 aircraft
[AD-A160749] p 294 N86-18321

**Aerospace Medical Research Labs., Wright-Patterson AFB, Ohio.**
B-52G crew noise exposure study
[AD-A161112] p 333 N86-20094

**Air Force Armament Lab., Eglin AFB, Fla.**
Mellin-Fourier correlation
[AD-A159685] p 330 N86-20006

**Air Force Environmental Technical Applications Center, Scott AFB, Ill.**
Limited Surface Observations Climatic Summary (LISOCS). Parts A, C-F: Bremen International, West Germany
[AD-A159656] p 323 N86-18894
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: General Billy Mitchell Field, Wisconsin
[AD-A159658] p 324 N86-18896
Revised Uniform Summary of Surface Weather Observations (RUSSWO). Parts A-F: Avieno AB, Italy
[AD-A159662] p 324 N86-18900

**Air Force Geophysics Lab., Hanscom AFB, Mass.**
Some microphysical processes affecting aircraft icing
[AD-A160375] p 325 N86-18921
In-flight turbulence detection
[AD-A160380] p 325 N86-18923
Joint agency turbulence experiment
[AD-A160420] p 325 N86-18924

**Air Force Human Resources Lab., Brooks AFB, Tex.**
Flight training simulators. Effects of terrain accuracy on simulated radar image quality
[AD-A160905] p 311 N86-18333

**Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.**
An electronic index of articles pertaining to Air Force transportation in the post-World War 2 era, with abstracts of selected articles
[AD-A160837] p 281 N86-18306
Probabilistic evaluation of individual aircraft tracking techniques
[AD-A160146] p 282 N86-18312
Effects of noise and workload on a communication task
[AD-A160743] p 321 N86-18599
A comparative evaluation of the reliability improvement in line replaceable units warranted under the F-16 reliability improvement warranty
[AD-A160830] p 321 N86-18630
Research and development project selection methods at the air Force Wright Aeronautical Laboratories
[AD-A161153] p 333 N86-20165

**Air Weather Service, Scott AFB, Ill.**
Catalog of air weather service technical documents
[AD-A159881] p 324 N86-18912

**Army Aviation Engineering Flight Activity, Edwards AFB, Calif.**
Preliminary airworthiness evaluation of the AH-1S (modernized cobra) with the Hellfire, TOW, and Stinger missiles installed
[AD-A160862] p 294 N86-18322

**Army Aviation Research and Development Command, Moffett Field, Calif.**
Effects of blade-to-blade dissimilarities on rotor-body lead-lag dynamics
[AD-A160497] p 293 N86-18317
Hover and forward flight acoustics and performance of a small-scale helicopter rotor system
[NASA-TM-88584] p 295 N86-19314

**Army Aviation Systems Command, St. Louis, Mo.**
Correlation of results of an OH-58A helicopter composite tail boom test with a finite element model
[AD-A161062] p 295 N86-19316

**Army Research and Technology Labs., Moffett Field, Calif.**
An experimental investigation of the parallel blade-vortex interaction p 276 A86-26106
Aircrew-aircraft integration - A summary of U.S. Army research programs and plans p 310 A86-26149
Calculation of helicopter airfoil characteristics for high tip-speed applications
[AD-A160694] p 277 N86-18294
An investigation of the use of bandwidth criteria for rotorcraft handling-qualities specifications
[AD-A160664] p 294 N86-18319

**Army Structures Lab., Hampton, Va.**
Interlaminar fracture of composites
p 313 A86-24986

## B

**Boeing Commercial Airplane Co., Seattle, Wash.**
The 737 graphite composite flight spoiler flight service evaluation
[NASA-CR-172600] p 314 N86-18446
Environmental exposure effects on composite materials for commercial aircraft
[NASA-CR-177929] p 314 N86-18449

**Boeing Military Airplane Development, Seattle, Wash.**
Atmospheric electricity hazards threat environment definition
[AD-A159739] p 324 N86-18909

**Bolt, Beranek, and Newman, Inc., Canoga Park, Calif.**
In-flight acoustic measurements on a light twin-engined turboprop airplane
[NASA-CR-178004] p 332 N86-20089

**Borst (Henry V.) and Associates, Wayne, Pa.**
Aerodynamic performance of two fifteen-percent-scale wind-tunnel drive fan designs
[AIAA PAPER 86-0734] p 273 A86-24729

## C

**California Univ., Davis.**
Automation effects in a multiloop manual control system p 329 A86-25035

**California Univ., Irvine.**
Aircraft measurements and coordination in FASINEX
[AD-A160789] p 321 N86-18699

**California Univ., Los Angeles.**
Aeromechanical stability analysis of a multirotor vehicle with application to hybrid heavy lift helicopter dynamics
p 290 A86-26141

**Centre National d'Etudes Spatiales, Toulouse (France).**
Long-duration flights using infrared Montgolfieres
p 323 N86-18861

**City Univ., London (England).**
Hover and forward flight acoustics and performance of a small-scale helicopter rotor system
[NASA-TM-88584] p 295 N86-19314

**Columbia Univ., New York.**
Acoustic guide for noise transmission testing of aircraft
[NASA-CASE-LAR-13111-1-CU] p 332 N86-20086

**Committee on Science and Technology (U. S. House).**
High speed aeronautics
[GPO-51-341] p 278 N86-19284

**Computer Sciences Corp., Silver Spring, Md.**
An approach to developing specification measures
p 330 N86-19968

**Consiglio Nazionale delle Ricerche, Florence (Italy).**
Remote sensing of oil on sea. Lidar and passive IR experiments p 320 N86-18370

## D

**Department of the Air Force, Washington, D.C.**
Modular air shut-off valve
[AD-D011935] p 321 N86-18728

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen (West Germany).**
Calculation of ice accretion on cylindrical rods according to Bain's model, and comparison with experimental results
[DFVLR-FB-85-46] p 325 N86-18933

**Drexel Univ., Philadelphia, Pa.**
Ultrasonic f-scan inspection of composite materials
[AD-A159974] p 314 N86-18451

## E

**Eidgenoessisches Flugzeugwerk, Emmen (Switzerland).**
Parametric determination of lift interference for three-dimensional models in the Emmen (Switzerland) aircraft works wind tunnel
[F + W-FO-1740] p 277 N86-18304
Performance computation of turbofan and turbojet engines in off-design conditions
[F + W-FO-1746] p 305 N86-19323

**Engineering Sciences Data Unit, London (England).**
Growth of cracks under constant amplitude fatigue loading: Example calculations
[ESDU-84001] p 322 N86-19642

## F

**Federal Aviation Administration, Washington, D.C.**
Flight operations noise tests of eight helicopters
[AD-A159835] p 331 N86-19127
International Civil Aviation Organization Helicopter Noise Measurement Repeatability Program: US test report, Bell 206L-1, noise measurement flight test
[AD-A159898] p 333 N86-20090

## G

**Grumman Aerospace Corp., Bethpage, N.Y.**
Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model
[AIAA PAPER 86-0780] p 286 A86-24759

## I

**Illinois Univ., Urbana.**
A class of airfoils having finite trailing-edge pressure gradients p 270 A86-23184

**Institut Franco-Allemand de Recherches, St. Louis (France).**
Experimental and theoretical study of incompressible flow around a wing profile with a spoiler. Contributions of laser velocimetry and the Dvorak method
[ISL-R-116/84] p 279 N86-19297
Experimental study of the acoustic fields far and near a Microturbo TRS 18 turboreactor
[ISL-R-113/84] p 333 N86-20095

## J

**JAI Associates, Mountain View, Calif.**
Aerodynamics of two-dimensional blade-vortex interaction
[AD-A160662] p 295 N86-19315

**Jet Propulsion Lab., California Inst. of Tech., Pasadena.**
High dynamic GPS receiver validation demonstration
[NASA-CR-176530] p 283 N86-19306

**Joint Publications Research Service, Arlington, Va.**
USSR report: Transportation
[JPRS-UTR-85-014] p 270 N86-18284
Aviaremont's efforts to introduce laser technology
p 320 N86-18286
USSR report: Transportation
[JPRS-UTR-85-015] p 294 N86-18323
Sukhoy design bureau builds sport plane made of plastic p 294 N86-18324
Features of planned IL-96-300, IL-114 aircraft
p 294 N86-18325
Powdered, sintered alloy materials described: Development of titanium alloys p 314 N86-19447
Improving commercial aircraft training simulators
p 295 N86-19836
Analytical evaluations of accuracy in determining and predicting parameters of artificial Earth satellite motion using altimeter measurement data p 312 N86-20196

## K

**Kentron International, Inc., Hampton, Va.**
Effects of digital altimetry on pilot workload
[SAE PAPER 841489] p 327 A86-26019

## M

**Massachusetts Inst. of Tech., Cambridge.**
Energetics and optimum motion of oscillating lifting surfaces of finite span p 274 A86-25084
A theoretical analysis of the effect of thrust-related turbulence distortion on helicopter rotor low-frequency broadband noise p 289 A86-26113
Helicopter attitude stabilization using individual-blade-control p 307 A86-26170

**Massachusetts Inst. of Tech., Lexington.**
Distributed sensor networks
[AD-A160596] p 332 N86-19136

**Mechanical Technology, Inc., Latham, N. Y.**
Interactive effects of high- and low-frequency loading on fatigue
[AD-A160601] p 293 N86-18318

**Michigan Univ., Ann Arbor.**
The utility of Head-Up Displays - Eye-focus vs decision times p 297 A86-23728

**Mitre Corp., McLean, Va.**
Potential applications of multiple instrument approach concepts at 101 U.S. Airports
[AD-A161155] p 283 N86-19308

## N

**National Aeronautical Establishment, Ottawa (Ontario).**
Analysis of experimental data for a 21% thick natural laminar flow airfoil, NAE68-060-21:1
[NAE-AN-34] p 278 N86-19285
Wind tunnel calibration of a PMS (Particle Measuring Systems) canister instrumented for airflow measurement
[AD-A161124] p 278 N86-19292

**National Aeronautical Lab., Bangalore (India).**
Fatigue crack propagation under spectrum loading
[NAL-TM-MT-8502] p 322 N86-19656

**National Aeronautical Lab., Tokyo (Japan).**
Fundamental investigation on the impact strength of hollow fan blades
[NAL-TR-879] p 322 N86-19657

**National Aeronautics and Space Administration, Washington, D.C.**
Aeronautical facilities catalogue. Volume 2: Airbreathing propulsion and flight simulators
[NASA-RP-1133] p 311 N86-18328

**National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.**
The utility of Head-Up Displays - Eye-focus vs decision times p 297 A86-23728
Aerodynamic performance of two fifteen-percent-scale wind-tunnel drive fan designs
[AIAA PAPER 86-0734] p 273 A86-24729
Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model
[AIAA PAPER 86-0780] p 286 A86-24759
Applications of an analysis of axisymmetric body effects on rotor performance and loads p 289 A86-26105
An experimental investigation of the parallel blade-vortex interaction p 276 A86-26106
Applications of numerical optimization methods to helicopter design problems - A survey
p 290 A86-26120
Hover test of a full-scale hingeless rotor
p 291 A86-26144
Aircrew-aircraft integration - A summary of U.S. Army research programs and plans p 310 A86-26149
Fire-retardant decorative inks for aircraft interiors
[NASA-TM-88196] p 313 N86-18441
Ground vibration test results for Drones for Aerodynamic and Structural Testing (DAST)/Aeroelastic Research Wing (ARW-1R) aircraft
[NASA-TM-85906] p 294 N86-19312
Dynamics and controls flight testing of the X-29A airplane
[NASA-TM-86803] p 295 N86-19313
Hover and forward flight acoustics and performance of a small-scale helicopter rotor system
[NASA-TM-86584] p 296 N86-19314
Comparison of pilot effective time delay for cockpit controllers used on space shuttle and conventional aircraft
[NASA-TM-86030] p 307 N86-19324
Flight test of a resident backup software system
[NASA-TM-86807] p 307 N86-19325
The role of a real-time flight support facility in flight research programs
[NASA-TM-86805] p 311 N86-19330

**National Aeronautics and Space Administration. John F. Kennedy Space Center, Cocoa Beach, Fla.**
Video processor for air traffic control beacon system
[NASA-CASE-KSC-11155-1] p 283 N86-19304

**National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.**
Airfoil tip vortex formation noise p 331 A86-23134
Composite statistical method for modeling wind gusts
p 308 A86-23169
Some lessons learned with wind tunnels
[AIAA PAPER 86-0777] p 310 A86-24756
A new direction in energy conversion - The all-electric aircraft p 319 A86-24830
Interlaminar fracture of composites
p 313 A86-24986
Effects of digital altimetry on pilot workload
[SAE PAPER 841489] p 327 A86-26019
Compressible, unsteady lifting-surface theory for a helicopter rotor in forward flight
[NASA-TP-2503] p 277 N86-18289
Low-speed wind-tunnel investigation of the effect of strakes and nose machines on lateral-directional stability of a fighter configuration
[NASA-TM-87641] p 278 N86-19287
Loads and aeroelasticity division research and technology accomplishments for FY 1985 and plans for FY 1986
[NASA-TM-87676] p 278 N86-19288
Application of mathematical optimization procedures to a structural model of a large finite-element wing
[NASA-TM-87597] p 322 N86-19661
Acoustic guide for noise transmission testing of aircraft
[NASA-CASE-LAR-13111-1-CU] p 332 N86-20086
Status and capabilities of sonic boom simulators
[NASA-TM-87664] p 332 N86-20088

**National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.**
Aerodynamic detuning analysis of an unstalled supersonic turbofan cascade
[ASME PAPER 85-GT-192] p 270 A86-22732
Fuel deposit characteristics at low velocity
[ASME PAPER 85-IGT-130] p 313 A86-23922
Current wind tunnel capability and planned improvements at Lewis Research Center
[NASA-TM-87190] p 311 N86-18329
Partitioning and packing mathematical simulation models for calculation on parallel computers
[NASA-TM-87170] p 330 N86-19008
Laboratory experiments on active suppression of advanced turboprop noise
[NASA-TM-87129] p 331 N86-19125

**National Aerospace Lab., Amsterdam (Netherlands).**
Flight test evaluation of the Netherlands flight inspection aircraft
[NLR-MP-84052-U] p 295 N86-19318
Determination of limitations for helicopter ship-borne operations
[NLR-MP-84072-U] p 295 N86-19319
Determination of performance and stability characteristics from dynamic maneuvers with a transport aircraft using parameter identification techniques
[NLR-MP-84024-U] p 308 N86-19326
Wind shear investigation program at the NLR
[NLR-MP-84027-U] p 325 N86-19806

**National Aerospace Lab., Tokyo (Japan).**
Calibration of an on-ground aircraft tracking radar by aerial photogrammetry
[NAL-TR-861] p 282 N86-18311
Aerodynamic transfer functions for a finite wing in incompressible flow
[NAL-TR-867] p 278 N86-19286
Study on the digital position transducer with optical time-delay pulse
[NAS-TR-878] p 322 N86-19583

**National Center for Atmospheric Research, Boulder, Colo.**
Microburst wind shear models from the Joint Airport Weather Studies (JAWS)
[AD-A159758] p 324 N86-18910

**National Research Council of Canada, Ottawa (Ontario).**
Subsonic wall interference corrections for half-model tests using sparse wall pressure data
[LR-616] p 276 N86-18287

**National Transportation Safety Board, Washington, D. C.**
General aviation crashworthiness project, phase 3: Acceleration loads and velocity changes of survivable general aviation accidents
[NTSB/SR-85/02] p 280 N86-18306
Aircraft accident reports: Brief formats, US civil and foreign aviation, issue number 1 of 1984 accidents
[PB85-916920] p 281 N86-18309
Aircraft accident reports: Brief format US Civil and Foreign Aviation, issue 2 of 1984 accidents
[PB85-916921] p 281 N86-18310

**Naval Aerospace Medical Research Lab., Pensacola, Fla.**
The effects of vocal versus manual response modalities on multi-task performance
[AD-A159830] p 321 N86-18586

**Naval Air Development Center, Warminster, Pa.**
Effectiveness of fatigue life enhancing fasteners in the design and rework of aircraft structures
[AD-A159676] p 293 N86-18316

**Naval Research Lab., Washington, D. C.**
The aircraft icing environment in wintertime, low ceiling conditions
[AD-A160576] p 280 N86-18307

**Naval Surface Weapons Center, Silver Spring, Md.**
Generation of the starting plane flowfield for supersonic flow over a spherically capped body
[AD-A161117] p 278 N86-19291

**New Mexico State Univ., Las Cruces.**
Horizontal display for vertical flight: A direction of motion experiment
[AD-A161113] p 299 N86-19321

**New South Wales Univ., Kensington (Australia).**
High velocity gas jet noise control
p 331 N86-19123
Signal processing in the airborne receiver of the Interscan microwave landing system
p 282 N86-19303

## O

**Ohio State Univ., Columbus.**
Performance of resonant radar target identification algorithms using intra-class weighting functions
p 321 N86-19490

**Oregon State Univ., Corvallis.**
Giebelstadt ain Germany (West). Limited surface observations climatic summary (LISOCS): Parts A, C-F
[AD-A159664] p 324 N86-18902

P

**Pennsylvania State Univ., University Park.**
A class of airfoils having finite trailing-edge pressure gradients p 270 A86-23184

**Princeton Univ., N. J.**
Longitudinal flying qualitites criteria for single-pilot instrument flight operations p 305 A86-23186

**Psycho-Linguistic Research Associates, Menlo Park, Calif.**
Comparison of voice types for helicopter voice warning systems
[SAE PAPER 841611] p 328 A86-26030

**Purdue Univ., West Lafayette, Ind.**
Aerodynamic detuning analysis of an unstalled supersonic turbofan cascade
[ASME PAPER 85-GT-192] p 270 A86-22732
An experimental investigation of propeller wakes using a laser Doppler velocimeter p 277 N86-19283

R

**Royal Signals and Radar Establishment, Malvern (England).**
Applications of expert systems p 330 N86-19634

T

**Technische Hogeschool, Delft (Netherlands).**
The conformal representation of the NACA 642A015 profile
[VTH-M-502] p 277 N86-18296
Calculation of the external nacelle surface for single and double stream jet engines for civil aircraft
[VTH-M-445] p 277 N86-18301
On the longest chord of the first Muller profile
[VTH-M-486] p 277 N86-18303
Design method for the calculation of performances and flap movement of flexible wind turbine blades
[VTH-M-453] p 323 N86-18795
An introduction to the application of Computer Aided Design (CAD) to the predesign of aircraft and the design of aircraft structures at the Aerospace Section
[VTH-M-512] p 330 N86-19045
Report of noise measurements with 2 different microphone dispositions on airplane type Cessna F 172L
[VTH-M-510] p 332 N86-19143
On the separated flow over a delta wing at high subsonic and transonic speeds
[VTH-M-527] p 279 N86-19293
Elements of the aerodynamic theory of cyclogyro wing systems with concentrator effects
[VTH-LR-338] p 279 N86-19294

**Toronto Univ., Downsview (Ontario).**
Automatic landing through the turbulent planetary boundary layer
[UTIAS-289] p 283 N86-19305

U

**United Technologies Research Center, East Hartford, Conn.**
Fuel deposit characteristics at low velocity
[ASME PAPER 85-IGT 130] p 313 A86-23922

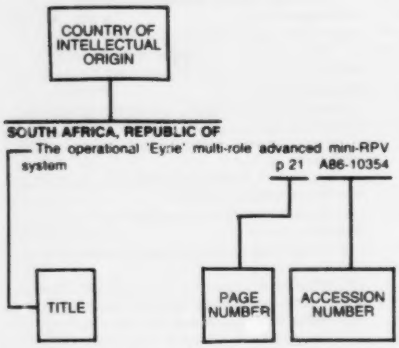
V

**Virginia Polytechnic Inst. and State Univ., Blacksburg.**
The response of airfoils to periodic disturbances - The unsteady Kutta condition
[AIAA PAPER 84-0050] p 270 A86-23126
A propeller model for studying trace velocity effects on interior noise p 284 A86-23191

# FOREIGN TECHNOLOGY INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 201)* JUNE 1986

### Typical Foreign Technology Index Listing



COUNTRY OF INTELLECTUAL ORIGIN
SOUTH AFRICA, REPUBLIC OF
The operational 'Eyrie' multi-role advanced mini-RPV system
p 21
A86-10354
TITLE
PAGE NUMBER
ACCESSION NUMBER

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section.

## A

**AUSTRALIA**

Equivalent stiffness and damping coefficients for squeeze film dampers p 319 A86-25751

The test loads sequences applied to the CT4 full scale fatigue test [AD-A160736] p 294 N86-16320

Resonance fatigue test of the empennage of a CT4 aircraft [AD-A160749] p 294 N86-16321

High velocity gas jet noise control p 331 N86-19123

Signal processing in the airborne receiver of the Interscan microwave landing system p 282 N86-19303

## C

**CANADA**

Investigation of a tip clearance cascade in a water analogy ring [ASME PAPER 85-IGT-65] p 270 A86-22730

Compressibility corrections for multifoil sections p 270 A86-23193

Further development in stores separation data acquisition and reduction p 315 A86-23262

Gas turbine fuels and their influence on combustion p 312 A86-23274

Aircraft flow effects on cloud drop images and concentrations measured by the NAE Twin Otter p 322 A86-23289

A stable discrete-time adaptive observer applied to multivariable aircraft p 305 A86-23346

A cost-effective performance development of the PT6A-65 turboprop compressor [ASME PAPER 85-IGT-41] p 301 A86-23853

Development of a new technology small fan jet engine [ASME PAPER 85-IGT-139] p 303 A86-23931

The world aircraft industry p 269 A86-26114

Subsonic wall interference corrections for half-model tests using sparse wall pressure data [LR-616] p 276 N86-18287

Analysis of experimental data for a 21% thick natural laminar flow airfoil, NAE68-060-21:1 [NAE-AN-34] p 278 N86-19285

Wind tunnel calibration of a PMS (Particle Measuring Systems) canister instrumented for airflow measurement [AD-A161124] p 278 N86-19292

Automatic landing through the turbulent planetary boundary layer [UTIAS-289] p 283 N86-19305

**CHINA, PEOPLE'S REPUBLIC OF**

Influence of nonlinear blade damping on helicopter ground resonance instability p 283 A86-23185

An experimental investigation of response of a turbojet engine to inlet distortion [ASME PAPER 85-IGT-12] p 301 A86-23832

Aerodynamic research on straight wall annular diffuser for turbofan augmentor [ASME PAPER 85-IGT-16] p 271 A86-23834

Discussion about dynamic simulation test of an aero-engine control system [ASME PAPER 85-IGT-30] p 308 A86-23845

Method of spare parts - Digital simulation of aircraft turbine engine control system [ASME PAPER 85-IGT-52] p 301 A86-23858

Optimal control change of state of aircraft turbine engine [ASME PAPER 85-IGT-53] p 301 A86-23859

The finite element stress analysis for solid-shell combined parts in aeroengines [ASME PAPER 85-IGT-72] p 317 A86-23873

Measurement of turbine blade temperature using pyrometer [ASME PAPER 85-IGT-78] p 317 A86-23879

Convergence of performance calculation of twin spool turbojet and turbofan [ASME PAPER 85-IGT-82] p 302 A86-23883

Rapid calculation of engine performance [ASME PAPER 85-IGT-83] p 302 A

Prediction of blade flutter in a tuned rotor [ASME PAPER 85-IGT-100] p 302 A86-23899

A survey of accelerated vibratory fatigue test method of aero-engine compressor blade [ASME PAPER 85-IGT-105] p 317 A86-23904

The solution of the thermal elastic-plastic problem of turbine disk by the incremental finite element method [ASME PAPER 85-IGT-112] p 317 A86-23909

Life prediction for the main shaft of aircraft turbine engine [ASME PAPER 85-IGT-136] p 303 A86-23928

The study of adaptive control augmentation system implemented with microcomputer p 306 A86-24577

**CZECHOSLOVAKIA**

Diagnostic methods for gas-turbine aircraft powerplants p 300 A86-23751

Determination of diagnostic parameters for the in situ diagnostics of the air-gas path of the AI-25TL engine p 300 A86-23752

Sound generation by an energetically inhomogeneous gas flow in a gas-turbine aircraft engine p 300 A86-23753

Simulation of the vibration transmission path and the use of a mathematical model of vibration transmission for the vibrational diagnostics of an aircraft engine p 301 A86-23754

In situ methods for crack detection in the master connecting rods of M 462 RF aircraft engines p 316 A86-23755

A holographic study of the vibrational modes of aircraft engine rotors p 301 A86-23756

A possible approach to the diagnostics of the hydraulic servomechanism of the aircraft control system p 285 A86-23757

Using wear products for assessing and predicting the condition of aircraft jet engines p 316 A86-23759

Testability of aircraft p 269 A86-23760

Airborne diagnostic equipment p 297 A86-23762

The measuring and control units of airborne recording systems p 297 A86-23763

The possibility of using the on-board computer for in-flight diagnostics p 297 A86-23765

Locating and demagnetizing magnetized aircraft components following a lightning stroke p 286 A86-23767

Methods for determining the weight and the center of gravity of aircraft - The platform balance of the Aeronautical Research and Test Institute p 286 A86-23768

A study of the service life of fail-safe airframe structures on the basis of routine inspections and crack size assessment p 286 A86-23769

New aspects of the small-perturbation method in aerodynamics p 271 A86-23770

The use of analytical methods to assess aircraft maneuverability p 305 A86-23771

Flight-mechanics problems solvable by a research flight simulator p 308 A86-23773

Practical difficulties in the theoretical design of low-speed profiles p 271 A86-23775

Means to increase the lift on aircraft wing profiles p 271 A86-23776

Development of numerical methods of external high-speed aerodynamics p 271 A86-23777

Distribution of optimal circulation on a propeller blade with a nonlinear dependence on the number of blades and with allowance tapering p 271 A86-23778

Pressure fluctuations on the external surface of an aircraft p 271 A86-23780

Problems in rudder design for small transport aircraft p 306 A86-23781

## F

**FRANCE**

Analysis of gamma ray families and jets up to 10 to the 7th GeV obtained during 1000 hours exposure of emulsion chambers on the Concorde p 333 A86-22863

New nose-in aircraft guidance/docking system developed p 308 A86-23380

Studies of the aerodynamics of flaps and spoilers in unsteady flow [ONERA, TP NO. 1985-149] p 272 A86-24627

A viscous-inviscid interaction model for transonic unsteady flow [ONERA, TP NO. 1985-152] p 272 A86-24630

Progress in the analysis of atmospheric turbulence [ONERA, TP NO. 1985-164] p 323 A86-24631

The effectiveness of various control surfaces in quasi-steady and unsteady flows - Applications [ONERA, TP NO. 1985-147] p 306 A86-24633

Solution of the Navier-Stokes equations in a compressible fluid by an implicit method [ONERA, TP NO. 1985-148] p 272 A86-24634

A numerical analysis of singular stress fields at the free edge of layered composites [ONERA, TP NO. 1985-154] p 313 A86-24636

Optical fibers application to visualization of flow separation inside an aircraft intake in wind tunnel [ONERA, TP NO. 1985-158] p 309 A86-24638

Recent advances in helicopter aerodynamics [ONERA, TP NO. 1985-166] p 273 A86-24642

Measurements accuracy with 3D laser velocimetry [ONERA, TO NO. 1985-171] p 318 A86-24646

Radial distribution circulation of a rotor in hover measured by laser velocimeter p 276 A86-26110

Tomorrow . . . Concorde's successor? p 293 A86-26299

Long-duration flights using infrared Montgolfiares p 323 N86-18861

Experimental and theoretical study of incompressible flow around a wing profile with a spoiler. Contributions of laser velocimetry and the Dvorak method [ISL-R-116/84] p 279 N86-19297

Technical evaluation report on the Fluid Dynamics Panel Symposium on Aerodynamics and Acoustics of Propellers [AGARD-AR-213] p 279 N86-19298

Transonic unsteady aerodynamics and its aeroelastic applications [AGARD-CP-374-ADD-1] p 279 N86-19299

Experimental study of the acoustic fields far and near a Microturbo TRS 18 turboreactor
[ISL-R-113/84] p 333 N86-20095

## G

**GERMANY,FEDERAL REPUBLIC OF**

Magnetic tape recording under severe environmental conditions p 314 A86-22716

The data transmission and processing equipment of a high-precision trajectory measurement system
p 296 A86-22728

The telemetry system of the DFVLR experimental aircraft ATTAS p 281 A86-22729

Economical in-flight calibration of air data sensors using inertial navigation units as reference
p 284 A86-23270

The effect of compressibility on slender vortices
p 317 A86-23944

Heat transfer problems in aero-engines
p 272 A86-24470

Sensor system concept for future fighter and strike aircraft p 297 A85-24583

Optimization of stepped input signals in the frequency domain for parametric identification p 329 A86-24586

Proposal for the choice of state variables for equations of motion of aircraft in moving air p 306 A86-24588

Comparative measurements of the unsteady pressures and the tip-vortex parameters on four oscillating wing tip models p 273 A86-24708

The accuracy problem of airplane development force testing in cryogenic wind tunnels
[AIAA PAPER 86-0776] p 310 A86-24765

Navier-Stokes solutions using finite volume procedures p 274 A86-25005

Navier-Stokes procedure for simulating two-dimensional and quasi-two-dimensional cascade flow
p 274 A86-25006

Communication with land vehicles and aircraft via satellite p 319 A86-25016

D-CALM - New research aircraft for remote sensing
p 287 A86-25020

The prop-fan introduces a new engine generation
p 304 A86-25021

The laminar wing - A way for improving the economy of commercial aircraft p 274 A86-25022

Future helicopter developments p 269 A86-25023

Computer-aided 'somatography' for the ergonomic design of the ATTAS experimental cockpit
p 287 A86-25024

Inertial navigation - The beginnings of an ingenious invention p 282 A86-25025

Improvement of two blade sections for helicopter rotors p 288 A86-26103

A consistent mathematical model to simulate steady and unsteady rotor-blade aerodynamics p 276 A86-26108

Comparative measurements of the unsteady pressures and the tip-vortex parameters of four oscillating wing tip models p 276 A86-26109

Theoretical prediction of running-time measurements in unsteady flow p 276 A86-26112

DFVLR flying qualities research using operational helicopters p 307 A86-26147

DFVLR helicopter in-flight simulator for flying quality research p 310 A86-26148

Calculation of ice accretion on cylindrical rods according to Bain's model, and comparison with experimental results
[DFVLR-FB-85-46] p 325 N86-18933

## I

**INDIA**

Simple technique moistureproofs ILS localizer antenna array p 282 A86-23379

Flat rating concept introduced in the GTX engine
p 304 A86-26071

Advances in simulation, control and guidance and other systems for manned and unmanned aircraft
p 269 A86-26072

Feasibility of simplifying coupled lag-flap-torsional models for rotor blade stability in forward flight
p 290 A86-26138

Fatigue crack propagation under spectrum loading
[NAL-TM-MT-8502] p 322 N86-19656

**ISRAEL**

A nonlinear model of aeroelastic behaviour of rotor blades in forward flight p 290 A86-26139

**ITALY**

Computer controlled variable pressure reducing/shut-off valve for aircraft ECS
[SAE PAPER 851360] p 285 A86-23545

Three component hot-wire measurements in the wake of a rotor model p 320 A86-26111

Investigation on a small scale model of ducted composite counterrotating rotor p 289 A86-26119

Composites in the development of Agusta helicopters
p 320 A86-26121

Manufacturing control over the reproduction of high integrity parts - A way to improve the safety of aeronautical products p 320 A86-26122

Optimum helicopter in the flight spectrum
p 290 A86-26123

The project for anti-tank helicopter
p 290 A86-26124

A first step for reducing helicopter IFR approach minima Agusta A109 IFR CAT II certification
p 280 A86-26127

Safety aspects in stores management systems
p 299 A86-26132

Antenna siting on helicopters p 282 A86-26133

Helicopter active control with blade stall alleviation modal capability p 307 A86-26136

Analytical and experimental results of the ground resonance phenomenon for A.129 p 291 A86-26142

Tests on whole A129 engine bay simulating the inertia and aerodynamic loads p 292 A86-26164

Simulation concepts and testing of the tail rotor fly-by-wire system of the A129 helicopter
p 292 A86-26165

Remote sensing of oil on sea: Lidar and passive IR experiments p 320 N86-18370

## J

**JAPAN**

Aeroacoustics of an advanced propeller design under takekoff and landing conditions p 284 A86-23190

Reliability and structural inspection program for transport aeroplanes p 269 A86-25176

Research and development of FJR 710 turbo fan engine - Second phase p 304 A86-25177

Effect of sweep angle on static aeroelasticity - Theory for physical meanings p 288 A86-25180

Energy saving in aircraft p 288 A86-25188

Doublet strip method for oscillating rectangular wings in subsonic flow p 274 A86-25189

Experimental study of the effects on the turbofan engine by the distortion p 304 A86-25192

A world review on air breathing engine altitude test facilities p 310 A86-25197

Improved doublet lattice method for oscillating swept tapered wings in incompressible flow
p 274 A86-25200

An analytical method of the characteristics of the turbofan engine components p 304 A86-25201

Deep stall characteristics of the MU-300
p 306 A86-25203

Aerodynamic characteristics of general aviation at high angle of attack with the propeller slip stream
p 306 A86-25204

Stall flutter of helicopter blade p 306 A86-25205

Recent computational fluid dynamics works about high angle of attack aerodynamics with separation vortex
p 274 A86-25206

Review of theory of vortex separated from a leading edge of a delta wing p 275 A86-25207

Trends of active control technology
p 307 A86-25213

Effects of measurement errors on estimation of the probability of vertical overlap p 290 A86-25214

Research on sonic inlet p 331 A86-25217

Vibration problems of jet engine rotor systems
p 304 A86-25219

Aerodynamic performances of fabric surface airfoils
p 275 A86-25224

On hypersonic flow around winged-vehicles at high angles of attack p 275 A86-25227

A study on the propulsive force of wings in non-steady motion by the theorem of momentum
p 275 A86-25233

A study of ramjet engine. III - Air inlet performance as the engine component p 304 A86-25234

Figures of out surface of an airplnne model
p 288 A86-25237

Two-dimensional scheme 'DLM-C' to examine subsonic unsteady lifting surface schemes for finite span
p 275 A86-25239

Aerodynamic characteristics of slender wing-gap-body combinations. II p 275 A86-25240

Dynamic response of windturbine to yawed wind
p 323 A86-26140

Nonlinear analysis for dynamic behaviours of a coupled rotational vibration system near its critical speed
p 291 A86-26143

Calibration of an on-ground aircraft tracking radar by aerial photogrammetry
[NAL-TR-861] p 282 N86-18311

Aerodynamic transfer functions for a finite wing in incompressible flow
[NAL-TR-867] p 278 N86-19286

Powdered, sintered alloy materials described: Development of titanium alloys p 314 N86-19447

Study on the digital position transducer with optical time-delay pulse
[NAS-TR-878] p 322 N86-19583

Fundamental investigation on the impact strength of hollow fan blades
[NAL-TR-879] p 322 N86-19657

## L

**LATVIA**

Current concepts of composite applications in aircraft and engines p 312 A86-23690

## N

**NETHERLANDS**

Wind tunnel wall influence considering two-dimensional high-lift configurations p 308 A86-23187

Determination of limitations for helicopter ship-borne operations p 280 A86-26151

ARALL - A light weight structural material for impact and fatigue sensitive structures p 313 A86-26158

Corrosion protection of helicopters through organic coatings p 313 A86-26159

The conformal representation of the NACA 642A015 profile
[VTH-M-502] p 277 N86-18296

Calculation of the external nacelle surface for single and double stream jet engines for civil aircraft
[VTH-M-445] p 277 N86-18301

On the longest chord of the first Muller profile
[VTH-M-486] p 277 N86-18303

Design method for the calculation of performances and flap movement of flexible wind turbine blades
[VTH-M-453] p 323 N86-18795

An introduction to the application of Computer Aided Design (CAD) to the predesign of aircraft and the design of aircraft structures at the Aerospace Section
[VTH-M-512] p 330 N86-19045

Report of noise measurements with 2 different microphone dispositions on airplane type Cessna F 172L
[VTH-M-510] p 332 N86-19143

On the separated flow over a delta wing at high subsonic and transonic speeds
[VTH-M-527] p 279 N86-19293

Elements of the aerodynamic theory of cyclogyro wing systems with concentrator effects
[VTH-LR-338] p 279 N86-19294

Flight test evaluation of the Netherlands flight inspection aircraft
[NLR-MP-84052-U] p 295 N86-19318

Determination of limitations for helicopter ship-borne operations
[NLR-MP-84072-U] p 295 N86-19319

Determination of performance and stability characteristics from dynamic maneuvers with a transport aircraft using parameter identification techniques
[NLR-MP-84024-U] p 308 N86-19326

Wind shear investigation program at the NLR
[NLR-MP-84027-U] p 325 N86-19808

**NEW ZEALAND**

A VME bus microcomputer system for experiment control and analysis on board an aircraft p 297 A86-23313

## P

**POLAND**

Comparative analysis of two methods for evaluating the loads acting on the tail plane during a symmetric manoeuvre p 287 A86-25095

An analysis of the influence of the duration and sharpness of a symmetric manoeuvre on the load acting on the tail plane p 287 A86-25096

## S

**SWEDEN**

Engine/airframe health and usage monitoring an alternate approach via advanced vibration monitoring systems p 296 A86-23255

**SWITZERLAND**

One man and 3,000 million operations a second - Preparing for the LHX cockpit p 286 A86-24988

Lavi - Advanced fighter and industrial springboard
p 287 A86-24990

Parametric determination of lift interference for three-dimensional models in the Emmen (Switzerland) aircraft works wind tunnel
[F+W-FO-1740] p 277 N86-18304

Performance computation of turbofan and turbojet engines in off-design conditions
[F+W-FO-1746] p 305 N86-19323

## U

**U.S.S.R.**

Determination of the service life of aviation oils p 312 A86-23450

Liapunov function for studying the stability in the whole of nonlinear systems p 331 A86-23576

Optimal control of integral-functional equations p 329 A86-23581

The problem of optimizing the final design modifications of stochastic oscillatory systems p 316 A86-23651

Calculation of the heating of a liquid component partially filling a container p 316 A86-23653

Aerodynamic design of an airfoil with allowance for the condition of nonseparated flow p 270 A86-23660

Electrical connections and antenna performance of a large composite fuselage module in the high frequency range p 292 A86-26157

Helicopter maneuvre stability - A new twist p 307 A86-26160

A review of RAE experimental techniques for rotor dynamics and aerodynamics p 292 A86-26161

Tests on a new dynamically scaled model rotor in the RAE 24 ft Wind Tunnel p 292 A86-26162

Design and testing of a large scale helicopter fuselage model in the RAE 5 metre pressurized wind tunnel p 292 A86-26163

Development testing of integrated avionics systems using dynamic environment simulation p 330 A86-26166

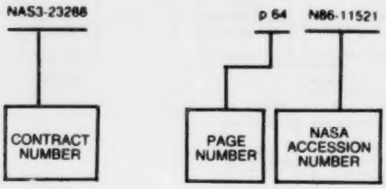
Helicopter vibration flight testing - The rotortuner approach p 293 A86-26169

Applications of expert systems p 330 N86-19634

Growth of cracks under constant amplitude fatigue loading: Example calculations
[ESDU-84001] p 322 N86-19642

# CONTRACT NUMBER INDEX

### Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

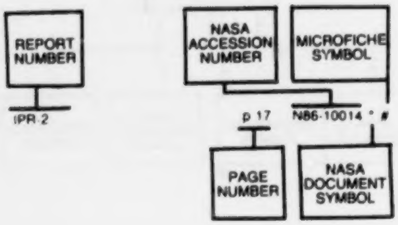
# REPORT NUMBER INDEX

### Typical Report Number Index Listing



Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

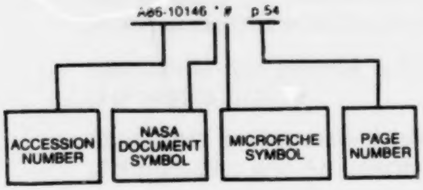
# ACCESSION NUMBER INDEX

### Typical Accession Number Index Listing



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A86-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for *IAA* source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N86-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA.

## PUBLIC COLLECTIONS OF NASA DOCUMENTS

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

### FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

## STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-914100 at the price of $7.00 domestic and $14.00 foreign—includes annual index. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

The Federal Depository Library Program provides Government publications to designated libraries throughout the United States. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and inter-library loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself.

This supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, price code A06.

# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 447 reports, journal articles, and other documents originally announced in June 1986 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

READEX FICHE best copy available

# TABLE OF CONTENTS

Page

**Category 01 Aeronautics (General)** 335

**Category 02 Aerodynamics** 336

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**Category 03 Air Transportation and Safety** 343

Includes passenger and cargo air transport operations; and aircraft accidents.

**Category 04 Aircraft Communications and Navigation** 345

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**Category 05 Aircraft Design, Testing and Performance** 352

Includes aircraft simulation technology.

**Category 06 Aircraft Instrumentation** 358

Includes cockpit and cabin display devices; and flight instruments.

**Category 07 Aircraft Propulsion and Power** 363

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

**Category 08 Aircraft Stability and Control** 365

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**Category 09 Research and Support Facilities (Air)** 370

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

**Category 10 Astronautics** 372

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

**Category 11 Chemistry and Materials** 372

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

**Category 12 Engineering** 380

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

**Category 13 Geosciences** 393

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

**Category 14 Life Sciences** 395

Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

**Category 15 Mathematics and Computer Sciences** 396

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

**Category 16 Physics** 400

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

**Category 17 Social Sciences** 402

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

**Category 18 Space Sciences** N.A.

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.

**Category 19 General** 403

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated.

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows.

## AERONAUTICS (GENERAL)

**A86-27020**
**STRENGTH IN ADVERSITY**
H. HOPKINS Flight International (ISSN 0015-3710), vol. 129, Feb. 8, 1986, p. 24-26, 29.

Airworthiness aspects of the new alloys, composites, and hybrid materials appearing in increasing percentage in modern commercial aircraft are considered. Current metal alloys such as those of aluminum-lithium aim at strength, stiffness, and low weight, but their composition exposes them to stress concentration, fatigue, and corrosion. Aramid-reinforced aluminum laminate (Arall) with fracture toughness in addition to the qualities of composites has application for fatigue-critical parts, especially thin, stiffened wing structures. Airbus' experience with composite material (more expensive than metal, but with lower production and maintenance costs) suggests that metals alloys will offer much better weight reduction than any developments in composites until improvements in fibers are matched by advances in resin systems. For fail-safe and damage-tolerance certification, nondestructive testing is conducted using ultrasonic methods for composites, and mechanical impedance analysis for both metals and composites. According to the CAA the long-term European aim must be the acceptance of safe-life design only if damage tolerance is impracticable. R.R.

**A86-27145#**
**ELECTROMAGNETIC PULSE TEST AIRCRAFT (EMPTAC) PROGRAM**
D. I. LAWRY (USAF, Weapons Laboratory, Kirtland AFB, NM) IN: International Symposium on Electromagnetic Compatibility, Wakefield, MA, August 20-22, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 373-375.

Electromagnetic pulses (EMP) which will only occur in the event of nuclear war represent a threat to modern weapon systems such as aircraft. The electromagnetic pulse test aircraft (EMPTAC) program is to provide a dedicated aircraft for conducting tests required in connection with EMP-related investigations. Attention is given to the EMP threat, past EMP efforts, details regarding the objectives of the EMPTAC program, the testbed aircraft, efforts in progress to support the development of subsystem and system level hardening specifications and associated verification testing, and aspects of hardness surveillance. Details of test technology are also considered along with a data analysis, questions of technology transition, and the challenge presented by the EMPTAC program. G.R.

**A86-27651**
**INTERNATIONAL CONFERENCE ON ROTORCRAFT BASIC RESEARCH, RESEARCH TRIANGLE PARK, NC, FEBRUARY 19-21, 1985, PROCEEDINGS**
Conference sponsored by AHS and U.S. Army. Alexandria, VA, American Helicopter Society, 1985, 352 p. For individual items see A86-27652 to A86-27669.

Various papers on rotorcraft basic research are presented. The subjects discussed include: analytical and experimental studies of textile structural composites, static postbuckling behavior of composite sandwich plates, optimal design of composite power transmission shafting, finite difference computations of rotor loads, semiempirical simulations of steady and unsteady rotor blade aerodynamic loading, wing/rotor and rotor/rotor interactions in tilt-rotor aircraft, helicopter model rotor-blade vortex interaction impulsive noise, and effects of side-stick controllers on rotorcraft handling qualities in terrain flight. Also addressed are: development of microcomputer codes for studying the flight dynamics and performance of helicopters, dynamic stability of hingeless and bearingless rotors in forward flight, structural dynamic aspects of rotor antiresonant isolation, kinematic observers for rotor control, aeroelastic stability analysis of a bearingless composite blade in hover, wake model for high resolution airloads, and prediction of flow around blade tips. C.D.

**ACCELERATED TESTING AS A MEANS OF ENSURING THE RELIABILITY OF AIRCRAFT EQUIPMENT [USKORENNYE ISPYTANIIA KAK SREDSTVO OBESPECHENIIA NADEZHNOSTI AVIATSIONNOI TEKHNIKI]**
A. V. MAIOROV IN: Problems in aircraft reliability . Moscow, Izdatel'stvo Mashinostroenie, 1985, p. 17-24. In Russian.

The methodological principles of the design and execution of laboratory tests on aircraft equipment are examined. It is emphasized that by properly designing and conducting accelerated test programs, it is possible to obtain, within a short period of time, information on changes in the technical condition of aircraft systems that are equivalent to changes occurring under conditions of actual flight operations. A chart of the operating factors included in a basic test cycle is presented. V.L.

**A86-28521**
**AIRCRAFT OF SPECIAL CONFIGURATIONS [SAMOLETY OSOBYKH SKHEM]**
D. A. SOBOLEV Moscow, Izdatel'stvo Mashinostroenie, 1985, 136 p. In Russian. refs

Various nontraditional aircraft concepts are reviewed from a historical and a technical standpoint. Particular attention is given to the tailless and canard aircraft configurations and to the factors that have limited the widespread use of these configurations. Also presented is a brief history of some other nontraditional aircraft concepts, such as tandem configurations, circular-wing aircraft, and sweptforward wing aircraft, as well as some unrealized designs. V.L.

## 01 AERONAUTICS (GENERAL)

**AEROELASTICITY AT THE NASA LANGLEY RESEARCH CENTER RECENT PROGRESS, NEW CHALLENGES**

P. W. HANSON Dec. 1985 76 p refs

(NASA-TM-87660; NAS 1.15:87660) Avail: NTIS HC A05/MF A01 CSCL 01B

Recent progress in aeroelasticity, particularly at the NASA Langley Research Center is reviewed to look at the questions answered and questions raised, and to attempt to define appropriate research emphasis needed in the near future and beyond. The paper is focused primarily on the NASA Langley Research Center (LaRC) Program because Langley is the lead NASA center for aerospace structures research, and essentially is the only one working in depth in the area of aeroelasticity. Historical trends in aeroelasticity are reviewed broadly in terms of technology and staffing particularly at the LaRC. Then, selected studies of the Loads and Aeroelasticity Division at LaRC and others over the past three years are presented with attention paid to unresolved questions. Finally, based on the results of these studies and on perceptions of design trends and aircraft operational requirements, future research needs in aeroelasticity are discussed. Author

**N86-21500#** Air Force Inst. of Tech., Wright-Patterson AFB, Ohio. School of Systems and Logistics.

**DEVELOPMENT OF A COMPUTERISED METHOD OF DETERMINING AIRCRAFT MAINTENANCE INTERVALS M.S. Thesis**

D. B. OHEARN Sep. 1985 102 p

(AD-A16[illegible]339; AFIT/GLM/LSM/85S-59) Avail: NTIS HC A06/MF A01 CSCL 05A

Scheduled maintenance is considered one of the largest costs of aircraft ownership. For some components that exhibit an increasing failure rate, this cost can be minimized by changing the components at their optimal age replacement intervals which can be determined using the Total-Time-on-Test statistic. However, the age replacement model treats all components as separate entities and does not recognize economies that can be achieved by changing groups of components at the same time. This study develops a heuristic model for determination of near optimal groupings of components and the replacement intervals for these components. This heuristic model is illustrated using actual field data for a number of components fitted to the C130H aircraft engines operated by the Royal Australian Air Force. GRA

## 02

## AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**A86-26409**

**AN ENGINEERING APPROACH TO THE INVERSE TRANSONIC WING DESIGN PROBLEM**

E. GREFF and J. MANTEL (Messerschmitt-Boelkow-Blohm GmbH, Bremen, West Germany) (International Conference on Inverse Design Concepts in Engineering Sciences, Austin, TX, Oct. 17-19, 1984) Communications in Applied Numerical Methods (ISSN 0748-8025), vol. 2, Jan.-Feb. 1986, p. 47-56. refs

The present state of the art in industrial wing design requires extensive configuration iterations through repeated wind tunnel test loops. The involved procedure is costly and time-consuming. It is, therefore, proposed to place greater emphasis on inverse design procedures in order to limit the number of wind tunnel models and reduce costly wind tunnel experiments. A new two-dimensional transonic direct inverse design method is presented, taking into account the use of a transonic direct code and a subsonic inverse code. The Direct Inverse Analogy Method (DIVA) considered takes advantage of the accuracy of subsonic airfoil design procedures and full potential transonic analysis methods. Attention is given to sample two-dimensional design cases, and aspects of transonic wing design. G.R.

**A86-26474**

**BASIC AERODYNAMICS**

C. B. STRIBLING London, Butterworths, 1984, 174 p. refs

It is the aim of this book to link computer programming with instruction in the fundamentals of aerodynamic theory. The book uses the BASIC language. An introduction to BASIC is provided, and the elements of fluid mechanics are examined, taking into account the properties of fluids, fluid statics, basic fluid dynamics, Reynolds number and Mach number, dimensional analysis, and similarity and wind tunnel testing. Other subjects investigated are related to stream function and velocity potential, the boundary layers, the airfoil section theory, finite wing theory, and supersonic flow. Attention is given to isentropic duct flow, a comparison of supersonic airfoil theories, pressures in a tip Mach triangle of a rectangular wing, the calibration of a Machmeter, shock waves, supersonic flow over curved surfaces and at corners, vortex theory, lifting line theory, lifting surface theory, properties of a specified wing, the lifting properties of a swept wing, the properties of a slender delta wing, thin airfoil theory, and boundary layer thicknesses. G.R.

**A86-27656#**

**SEMI-EMPIRICAL SIMULATION OF STEADY AND UNSTEADY ROTOR BLADE AERODYNAMIC LOADING**

U. LEISS (Muenchen, Hochschule der Bundeswehr, Munich, West Germany) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 15 p. refs

(Contract BMFT-LFF-83408)

A general formulation was developed to simulate the aerodynamic coefficients of a rotor blade at arbitrary angles of attack and Mach numbers by analytical expressions in steady and unsteady flow. The real aerodynamic behavior is simulated by the superposition of different flow types. Theory for a flat plate is the basis for the semi-empirical load simulation of arbitrary shapes. Only this physical superposition principle of steady flow enables a consistent formulation of unsteady effects. The difference between the method and measurement data is within the measurement accuracy. The comparison with other methods indicates a significant progress. The modular form of the model allows any refinement without any change of structure. In some cases analytical integration in radial direction is possible. Author

**A86-27666#**

**A WAKE MODEL FOR HIGH RESOLUTION AIRLOADS**

T. S. BEDDOES (Westland Helicopters, Ltd., Yeovil, England) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 12 p. refs

A rotor wake model has been constructed which identifies the important features of the wake and evaluates the local, dominant effects accurately. The greater part of the wake, which in this application is less important, is treated more approximately but still with small absolute error. Each turn of the spiral trailing vortex is considered, defining the geometry and determining the critical points relative to the portion of the blade under consideration. The induced velocity is then estimated by positioning large elements in critical locations and adding a remainder term for the rest of the spiral turn. A finite core model for the structure of the trailing vortices is included, and the influence of the relative local skew angle between the blade and vortex is considered. C.D.

**A86-27667#**
**FREE WAKE MODEL OF HOVERING ROTORS HAVING STRAIGHT OR CURVED BLADES**
A. ROSEN (Rensselaer Polytechnic Institute, Troy, NY) and A. GRABER (Technion Israel Institute of Technology, Haifa) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 16 p. refs

A free-wake model of hovering rotors or rotors in axial flight is derived. Straight or curved blades can be analyzed. The blades are modeled as lifting surfaces having one cell in the chordwise direction. The wake is divided into near and far regions. The near-wake is formed of straight vortex elements while semi-infinite helical vortex lines form the far wake. Results for two rotors having straight blades are presented. Convergence and stability of the numerical model are investigated. Comparison with experimental results shows good agreement in most of the cases. Author

**A86-27668#**
**THE PREDICTION OF FLOW AROUND BLADE TIPS**
B. E. WAKE, N. L. SANKAR, S. G. LEKOUDIS, and R. B. GRAY (Georgia Institute of Technology, Atlanta) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 10 p. Army-supported research. refs

The problem of predicting the aerodynamics of the flow around blade tips is reviewed, and the different methods for predicting that flowfield are discussed. A solution procedure, based on the Euler equations is developed, and it is coupled with Gray's wake model for hover, by splitting the flow variables into two components. One of the components is prescribed and the other is computed, while their sum satisfies the conservation laws. Calculations are presented for tip flows at transonic speeds and they are compared with measured data. Author

**A86-27669*#** National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.
**RECONSTRUCTION OF A THREE-DIMENSIONAL, TRANSONIC ROTOR FLOW FIELD FROM HOLOGRAPHIC INTERFEROGRAM DATA**
Y. H. YU, J. K. KITTLESON (NASA, Ames Research Center; U.S. Army, Aeromechanics Laboratory, Moffett Field, CA), and F. BECKER (Max-Planck-Institut fuer Stroemungsforschung, Goettingen, West Germany) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings (A86-27651 11-01). Alexandria, VA, American Helicopter Society, 1985, 26 p. Previously announced in STAR as N85-21112. refs
(AIAA PAPER 85-0370)

Holographic interferometry and computer-assisted tomography (CAT) are used to determine the transonic velocity field of a model rotor blade in hover. A pulsed ruby laser recorded 40 interferograms with a 2-ft-diam view field near the model rotor-blade tip operating at a tip Mach number of 0.90. After digitizing the interferograms and extracting fringe-order functions, the data are transferred to a CAT code. The CAT code then calculates the perturbation velocity in several planes above the blade surface. The value from the holography-CAT method compare favorably with previously obtained numerical computations in most locations near the blade tip. The results demonstrate the technique's potential for three-dimensional transonic rotor flow studies. Author

**A86-28525**
**AERODYNAMICS OF AIRCRAFT ELEMENTS [AERODINAMIKA ELEMENTOV LETATEL'NYKH APPARATOV]**
K. P. PETROV Moscow, Izdatel'stvo Mashinostroenie, 1985, 272 p. In Russian. refs

The aerodynamic characteristics of the principal aircraft components, such as airfoils, wings of finite length, lift-increasing devices, fuselage, and control elements, are examined in a systematic manner for various flight conditions. The discussion is based on the results of recent experimental studies and contains formulas for approximate aerodynamic calculations. Specific topics discussed include pressure distribution on an airfoil; aerodynamic characteristics of swept wings at low angles of attack in the subsonic and transonic ranges; characteristics of flow past bodies of high aspect ratios; and the effect of the cross-sectional shape of a body of high aspect ratio on its principal aerodynamic characteristics. Finally, some problems associated with the interference between individual aircraft components are examined. V.L.

**A86-28535#**
**A PERTURBATIVE LAMBDA FORMULATION**
A. DADONE and M. NAPOLITANO (Bari, Universita, Italy) AIAA Journal (ISSN 0001-1452), vol. 24, March 1986, p. 411-417. Research supported by the Ministero della Pubblica Istruzione and CNR. refs

This paper provides a new perturbative lambda formulation for the numerical solution of compressible flows. The time-dependent Euler equations are recast into compatibility equations for perturbative bicharacteristic variables that are the differences between the standard Riemann variables and those corresponding to an appropriate steady incompressible flow. In this way, the geometry-induced gradients are accounted for by the incompressible flow solution and the smooth correction accounting for compressibility effects is solved accurately even on a coarse mesh. The new perturbative lambda equations for two-dimensinal homentropic flows are provided in a general orthogonal curvilinear coordinate system and solved numerically by means of an alternating direction implicit method. Results are presented for flow past a NACA 0012 airfoil that demonstrate the remarkable accuracy of the proposed methodology. Author

**AN EXPERIMENTAL STUDY OF THE FLOW AND WALL PRESSURE FIELD AROUND A WING-BODY JUNCTION**
M. A. Z. HASAN, M. J. CASARELLA (Catholic University of America, Washington, DC), and E. P. ROOD (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD) IN: Shear flow - Structure interaction phenomena; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 . New York, American Society of Mechanical Engineers, 1985, p. 89-95. Navy-supported research. refs

The flow and the wall-pressure field around a wing-body junction has been investigated in a quiet, low-turbulence wind tunnel, measuring the point spectral densities along the centerline in front of the wing and along several spanwise locations. The strong adverse pressure gradient on the upstream centerline causes a three-dimensional flow separation at approximately one wing thickness upstream, inducing the formation of the horseshoe root vortex which wraps around the wing and becomes embedded within the boundary layer. Significant increases in the level of turbulence were observed both in the attached boundary layer and within the secondary flow. The data on the spectral content of the wall pressure fluctuations indicate that the increased levels of turbulence can be attributed to the low-frequency organized motion associated with the root vortex. I.S.

### THREE-DIMENSIONAL AND UNSTEADY BOUNDARY-LAYER COMPUTATIONS

J. COUSTEIX (ONERA, Centre d'Etudes et de Recherches de Toulouse, France) IN: Annual review of fluid mechanics. Volume 18 . Palo Alto, CA, Annual Reviews, Inc., 1986, p. 173-196. refs

Three-dimensional boundary layers which develop on a wing or fuselage of an aircraft, and unsteady boundary layers that are formed by imposed unsteadiness are studied. The coordinate system and equations for three-dimensional boundary layers are presented; the use of finite-difference methods to solve the equations is examined. The occurrence of singularities in two-dimensional and three-dimensional boundary layer computations is investigated. The development of turbulence models for two-dimensional and three-dimensional boundary layers is described; the effects of near-wall treatment on turbulence modeling is analyzed. I.F.

**A86-29417**

### VORTEX FLOWS IN AERODYNAMICS

J. H. B. SMITH (Royal Aircraft Establishment, Farnborough, England) IN: Annual review of fluid mechanics. Volume 18 . Palo Alto, CA, Annual Reviews, Inc., 1986, p. 221-242. refs

Planar vortex flows and three-dimensional flows from boundary-layer separation lines which arise in the external aerodynamics of aircraft, are studied. The difficulties encountered in modeling the Prandtl-Batchelor flows of an inviscid fluid past a two-dimensional body are examined. The characteristics of three-dimensional flows from swept separation lines, and the need to include secondary and turbulent separations in the modeling of the flows are described. The uses of the vortex-sheet model in the slender-body (SB) framework and the multiple line-vortex models in the SB and Prandtl-Glauert frameworks to represent and predict three-dimensional vortex flows are investigated. The inviscid modeling of vortex flow with the Euler equations, which take into account vorticity, is analyzed; examples revealing the applicability of Euler models are presented. I.F.

### TRANSONIC FLOW CALCULATIONS FOR AIRCRAFT

A. JAMESON (Princeton University, NJ) IN: Numerical methods in fluid dynamics . Berlin and New York, Springer-Verlag, 1985, p. 156-242. refs

The present evaluation of recent advancements in computational aerodynamics gives attention to the calculation of steady transonic flows over bodies of extreme geometric complexity, including those cases in which the domain is multiply connected, using either the potential flow equation or the Euler equations. The discussion encompasses the choice of a mathematical model, transonic potential flow equation upwind differencing, the treatment of complex geometric configurations, and convergence acceleration, as well as modification of the Euler equations for faster convergence to a steady state, the MacCormack and semidiscrete finite volume schemes, and viscous flow calculations. O.C.

### AERODYNAMICS. PART 1 - FUNDAMENTALS OF THEORY. AERODYNAMICS OF AN AIRFOIL AND A WING

N. F. KRASNOV (Moskovskoe Vysshee Tekhnicheskoe Uchilishche, Moscow, USSR) Moscow, Mir Publishers, 1985, 512 p. Translation. refs

An introductory treatment of the aerodynamics of airfoils wings is presented. The fundamental theoretical problems of airfoil aerodynamics are considered, with emphasis given to: the equations of motion in viscous and inviscid flows; energy diffusion equations of gaseous media; and shock wave theory. Methods for calculating the stationary aerodynamic characteristics of airfoils and wings are discussed, including; the method of characteristics; Eulerian approaches; and Lagrangian methods. The application of flow calculations to specific aircraft designs is addressed in a companion volume. I.H.

### MODULAR APPLICATION OF A SHOCK/BOUNDARY LAYER INTERACTION SOLUTION TO SUPERCRITICAL VISCOUS-INVISCID FLOW FIELD ANALYSIS

G. R. INGER and W. G. HABASHI, ed. 1984 40 p refs
Reprinted from Computational Methods in Viscous Flows. Volume 3: Recent Advances in Numerical Methods in Fluids (Swansea, England), 1984 p 1-38
Avail: NTIS HC A03/MF A01

Shock boundary layer interaction influence extends significantly downstream within the boundary layer and thereby alters the global aerodynamic properties of lift, drag and pitching moment. Shock boundary layer interactions and their Reynolds and Mach number scaling must be fundamentally understood and appropriate theoretical tools be developed for their prediction in engineering applications. Features of an approximate nonasymptotic triple deck theory of shock turbulent boundary layer interaction and its application as an element in the overall viscous flow analysis of the body are described. Two main aspects of the problem are examined: local interactive thickening and skin friction drop in the shock foot region, including the effects of the incoming boundary layer shape factor, wall curvature, an improved viscous ramp model of the interaction and an approximate prediction of incipient separation behavior; and influence of such interaction on the subsequent downstream turbulent boundary layer thickening, profile shape and skin friction behavior. Comparisons with experimental data are given and applications presented for both supercritical airfoils and transonic bodies of revolution. Author

### EXPLORATORY LOW-SPEED WIND-TUNNEL STUDY OF CONCEPTS DESIGNED TO IMPROVE AIRCRAFT STABILITY AND CONTROL AT HIGH ANGLES OF ATTACK M.S. Thesis

D. E. HAHNE Dec. 1985 73 p refs Sponsored by NASA
(NASA-CR-176615; NAS 1.26:176615) Avail: NTIS HC A04/MF A01 CSCL 01A

A wind tunnel investigation of concepts to improve the high angle-of-attack stability and control characteristics of a high performance aircraft was conducted. The effect of vertical tail geometry on stability and the effectiveness of several conventional and unusual control concepts was determined. These results were obtained over a large angle-of-attack range. Vertical tail location, cant angle and leading edge sweep could influence both longitudinal and lateral-directional stability. The control concepts tested were found to be effective and to provide control into the post stall angle-of-attack region. Author

### EFFECT OF UNDERWING AFT-MOUNTED NACELLES ON THE LONGITUDINAL AERODYNAMIC CHARACTERISTICS OF A HIGH-WING TRANSPORT AIRPLANE

W. K. ABEYOUNIS and J. C. PATTERSON, JR. Dec. 1985 139 p refs
(NASA-TP-2447; L-15664; NAS 1.60:2447) Avail: NTIS HC A07/MF A01 CSCL 01A

As part of a propulsion/airframe integration program, tests were conducted in the Langley 16-Foot Transonic Tunnel to determine the longitudinal aerodynamic effects of installing flow through engine nacelles in the aft underwing position of a high wing transonic transfer airplane. Mixed flow nacelles with circular and D-shaped inlets were tested at free stream Mach numbers from 0.70 to 0.85 and angles of attack from -2.5 deg to 4.0 deg. The aerodynamic effects of installing antishock bodies on the wing and nacelle upper surfaces as a means of attaching and supporting nacelles in an extreme aft position were investigated. Author

### INSTALLATION EFFECTS OF LONG-DUCT PYLON-MOUNTED NACELLES ON A TWIN-JET TRANSPORT MODEL WITH SWEPT SUPERCRITICAL WING

E. E. LEE, JR. and O. C. PENDERGRAFT, JR. Dec. 1985 145 p refs
(NASA-TP-2457; L-15932; NAS 1.60:2457) Avail: NTIS HC A07/MF A01 CSCL 01A

The installation interference effects of an underwing-mounted, long duct, turbofan nacelle were evaluated in the Langley 16-Foot Transonic Tunnel with two different pylon shapes installed on a twin engine transport model having a supercritical wing swept 30 deg. Wing, pylon, and nacelle pressures and overall model force data were obtained at Mach numbers from 0.70 to 0.83 and nominal angles of attack from -2 deg to 4 deg at an average unit Reynolds number of 11.9 x 1,000,000 per meter. The results show that adding the long duct nacelles to the supercritical wing, in the near sonic flow field, changed the magnitude and direction of flow velocities over the entire span, significantly reduced cruise lift, and caused large interference drag on the nacelle afterbody. ### AERODYNAMIC CHARACTERISTICS OF SEVERAL CURRENT HELICOPTER TAIL BOOM CROSS SECTIONS INCLUDING THE EFFECT OF SPOILERS

J. C. WILSON and H. L. KELLEY Jan. 1986 74 p refs
(Contract DA PROJ. 1L1-61102-AH-45)
(NASA-TP-2506; L-15978; NAS 1.60:2506; AVSCOM-TR-85-B-3)
Avail: NTIS HC A04/MF A01 CSCL 01A

Aerodynamic characteristics were determined of three cylindrical shapes representative of tail boom cross sections of the U.S. Army AH-64, UH-60, and UH-1H helicopters. Forces and pressures were measured in a wind-tunnel investigation at the Langley Research Center. Data were obtained for a flow incidence range from -45 to 90 deg and a dynamic pressure range from 1.5 to 50 psf. These ranges provided data representative of full-scale Reynolds numbers and the full range of flow incidence to which these helicopter tail boom shapes would be subjected at low flight speeds. The effects of protuberances such as tail rotor drive-shaft covers and spoilers were evaluated. The data indicate that significant side loads on tail booms of helicopters can be generated and that the addition of spoilers can beneficially alter the side loads. Although an increase in vertical drag occurs, the net effect through reduction of tail rotor thrust required can be an improvement in helicopter performance. Author

### FLIGHT MEASUREMENTS OF SURFACE PRESSURES ON A FLEXIBLE SUPERCRITICAL RESEARCH WING

C. V. ECKSTROM Dec. 1985 120 p refs
(NASA-TP-2501; L-15877; NAS 1.60:2501) Avail: NTIS HC A06/MF A01 CSCL 01A

A flexible supercritical research wing, designated as ARW-1, was flight-tested as part of the NASA Drones for Aerodynamic and Structural Testing Program. Aerodynamic loads, in the form of wing surface pressure measurements, were obtained during flights at altitudes of 15,000, 20,000, and 25,000 feet at Mach numbers from 0.70 to 0.91. Surface pressure coefficients determined from pressure measurements at 80 orifice locations are presented individually as nearly continuous functions of angle of attack for constant values of Mach number. The surface pressure coefficients are also presented individually as a function of Mach number for an angle of attack of 2.0 deg. The nearly continuous values of the pressure coefficient clearly show details of the pressure gradient, which occurred in a rather narrow Mach number range. The effects of changes in angle of attack, Mach number, and dynamic pressure are also shown by chordwise pressure distributions for the range of test conditions experienced. Reynolds numbers for the tests ranged from 5.7 to 8.4 x 1,000,000. Author

### THE APPLICATION TO AIRFOILS OF A TECHNIQUE FOR REDUCING ORIFICE-INDUCED PRESSURE ERROR AT HIGH REYNOLDS NUMBERS

E. B. PLENTOVICH Jan. 1986 44 p refs
(NASA-TP-2537; L-16002; NAS 1.60:2537) Avail: NTIS HC A03/MF A01 CSCL 01A

A wind tunnel investigation was conducted in the Langley 0.3-Meter Transonic Cryogenic Tunnel to [illegible] the effects of porous (sintered metal) plug orifices [illegible] orifice-induced static-pressure measurement error at high Reynolds numbers. A NACA airfoil was tested at Mach numbers from 0.60 to 0.80 and at Reynolds numbers from 6 x 1,000,000 to 40 x 1,000,000. Data are included which compare pressure measurements obtained from porous plug orifices and from conventional orifices with diameters of 0.025 cm (0.010 in.) and 0.102 cm (0.040 in.). The two dimensional airfoil code GRUMFOIL was used to calculate boundary layer displacement thickness. The response time and the downstream effect of the porous plug orifice were considered in this investigation. The results showed that the porous plug orifice could be a viable method of reducing pressure error. The data also showed that the pressure measurements obtained with a 0.102-cm-diameter orifice were very close to the measurements obtained with 0.025-cm-diameter orifice over such of the airfoil and that downstream of a shock the orifice size was not critical. ### RESEARCH ON THE AERODYNAMIC CHARACTERISTICS OF VEHICLES BY FREE FLIGHT TESTING AT SUPERSONIC SPEEDS

I. KAWAMOTO Sep. 1985 74 p refs In JAPANESE; ENGLISH summary
(NAL-TR-876; ISSN-0389-4010) Avail: NTIS HC A04/MF A01

A new free flight testing technique was developed in the 1mx1m blow-down supersonic wind tunnel. The following results were obtained: (1) a new launching method in which a model is installed inside the launcher was developed, and various models were successfully launched at various angles of attack; (2) a data processing program for moving models was developed by use of a parameter identification method under the assumption of three degrees of longitudinal freedom of motion; (3) cone models, Mercury capsule models, blunt cone capsule models, sounding rocket models and supersonic aircraft models were launched, results were obtained from the flight tests. There sometimes existed a short duration of the freedom motion, the data reduction to this partial duration of motion are in agreement with the conventional wind tunnel force test results in the aerodynamic coefficients, the divergence of the pitching motion of the Mercury Capsule model was shown in pictures; (4) the relations between the amount of data gathered during a run and the aerodynamic characteristics derived thererom are discussed; and (5) the excessive nonlinear terms of alpha for the aerodynamic expressions sometimes result in unacceptable aerodynamic characteristics. **JET PLUME TEMPERATURE EFFECTS ON AFTERBODY PRESSURE DISTRIBUTION AND DRAG**

N. B. MATHUR and K. S. YAJNIK Mar. 1985 10 p refs
(NAL-TM-FM-8502) Avail: NTIS HC A02/MF A01

A typical axisymmetric configuration with a circular arc boattailed afterbody was investigated to study the jet plume temperature effects on afterbody pressure distribution and drag. The experiments which were carred out at a free stream Mach number of 0.62 and jet pressure ratio of about 3.0 show that as the jet temperature ratio is increased the afterbody pressures tend to increase and the afterbody pressure drag tends to decrease. It is a reduction in afterbody pressure drag by about 30 to 40% is shown when the jet plume temperature is increased from 307 deg K (cold jet) to 945 deg K. Both jet plume temperature and the afterbody surface temperature effects generally contribute to the observed changes in the pressure distribution and drag. E.A.K.

**SIDE FORCE CHARACTERISTICS OF A 20 DEG CONE AT HIGH ANGLES OF ATTACK**

P. R. VISWANATH and K. Y. NARAYAN May 1985 24 p refs
(NAL-TM-AE-8503) Avail: NTIS HC A02/MF A01

Force measurements were made on a 20 deg. cone to study the features of side force generation at high angles of attack. The experiments covered a Mach number range of 0.17 to 0.25 and a Reynolds number range of 0.5 to 2.8x1,000,000. The model incidence was varied up to 47 deg. The magnitude of side forces and the onset angle of attack for side force generation are in fairly good agreement with other published data on cones. E.A.K.

**EFFECTS OF PLANFORM GEOMETRY ON HOVER PERFORMANCE OF A 2-METER-DIAMETER MODEL OF A FOUR-BLADED ROTOR**

A. E. PHELPS, III and S. L. ALTHOFF Mar. 1986 33 p refs
(Contract DA PROJ. 1L1-61102-AH-45)
(NASA-TM-87607; L-16020; NAS 1.15:87607; AVSCOM-TR-85-B-6) Avail: NTIS HC A03/MF A01 CSCL 01A

Hover tests were conducted on three small scale rotors to evaluate the effects of blade planform taper on rotor hover performance. Tests were conducted on a rectangular swept-tip configuration, on a configuration with a 3 to 1 taper over the outboard 20 percent of the span, and on a configuration with a 5 to 1 taper over the outboard 20 percent of the blade span. The investigation covered a range of thrust coefficients from 0 to 0.0075 and a range of tip speeds from 300 to 600 ft/sec. The tests showed that both tapered configurations had better hover performance than the swept-tip rectangular configuration and that the 3 to 1 taper configuration was better than the 5 to 1 taper configuration. The test results were compared with predictions made with a prescribed wake analysis, a momentum analysis, and a simplified free wake analysis. Author

**METHOD FOR THE PREDICTION OF THE INSTALLATION AERODYNAMICS OF A PROPFAN AT SUBSONIC SPEEDS: USER MANUAL**

B. CHANDRASEKARAN Jan. 1986 100 p refs
(Contract NAS1-17826)
(NASA-CR-178057; NAS 1.26:178057) Avail: NTIS HC A05/MF A01 CSCL 01A

This document is the user's guide for the method developed earlier for predicting the slipstream wing interaction at subsonic speeds. The analysis involves a subsonic panel code (HESS code) modified to handle the propeller onset flow. The propfan slipstream effects are superimposed on the normal flow boundary condition and are applied over the surface washed by the slipstream. The effects of the propeller slipstream are to increase the axial induced velocity, tangential velocity, and a total pressure rise in the wake of the propeller. Principles based on blade performance theory, momentum theory, and vortex theory were used to evaluate the slipstream effects. The code can be applied to any arbitrary three dimensional geometry, expressed in the form of HESS input format. The code can handle a propeller alone configuration or a propeller/nacelle/airframe configuration, operating up to high subcritical Mach numbers over a range of angles of attack. Inclusion of a viscous modelling is briefly outlined. Wind tunnel results/theory comparisons are included as examples for the application of the code to a generic supercritical wing/overwing Nacelle with a powered propfan. A sample input/output listing is provided. Author

**SUBSONIC FLOW INVESTIGATIONS ON A CRANKED WING DESIGNED FOR HIGH MANEUVERABILITY Final Report**

D. M. RAO Feb. 1986 45 p refs
(Contract NAS1-17420)
(NASA-CR-178046; NAS 1.26:178046) Avail: NTIS HC A03/MF A01 CSCL 01A

The characteristic pitching moment nonlinearity of cranked wings limits their usable lift coefficient well below C sub L max. The potential of several aerodynamic devices, viz., fences, pylon vortex generators (PVG), mid-span strakes and cavity flaps, in delaying the pitch up onset on a 70/50 deg cranked wing was explored in low speed tunnel tests. Upper surface pressure measurements and low visualizations were conducted on a semi-span wing model to observe the vortex flow development with increasing angle of attack, and then to assess the effectiveness of the devices in controlling the collapse of vortex lift over the wing panel outboard of the crank. Force tests on a full span wing and body model were also conducted to assess the fence and PVG in improving the usable C sub L. Author

**A VISUALISATION STUDY OF THE VORTEX FLOW AROUND DOUBLE-DELTA WINGS**

D. H. THOMPSON 1985 70 p refs
(ARL-AERO-R-165; AR-004-047) Avail: NTIS HC A04/MF A01

A family of double delta wings with leading edge sweep combinations of 80/80, 80/70, 80/60, 80/50, and 80/40 degrees was tested in a small towing tank. The hydrogen bubble technique was used to visualize the vortex patterns above the wings over a range of Reynolds numbers (based on centerline chord) from 7,000 to 100,000. The effects of variations in incidence and leading edge kink angle were examined. Reynolds number and leading edge cross section shape were found to have significant effects on the vortex structure. Attempts to visualize details of the upper surface secondary vortex flows met with only partial success. Author

**NUMERICAL ANALYSIS OF INVISCID FLOWS ABOUT WING-FUSELAGE COMBINATIONS. 2: DEVELOPMENT OF FULL POTENTIAL FLOW CODE YOKUDO-P**
T. ISHIGURO 1985 87 p refs In JAPANESE; ENGLISH summary
(NAL-TR-881; ISSN-0389-4010) Avail: NTIS HC A05/MF A01

The main purpose of this paper is to numerically analyze inviscid flows about wing-fuselage combinations. In the second series a numerical procedure is developed for calculating full potential flows about wing-fuselage combinations by the successive-line-over-relaxation method of the rotated finite difference scheme, using the grids which have already been generated by the code YOKUDO-G in the first series. A user's manual for the FORTRAN code of the procedure is also described. Furthermore, many numerical examples are presented in order to show the utility of this code for flows about several wing-fuselage combinations under several free stream boundary conditions. The numerical results obtained by this code are compared with the experimental results and with numerical results of other methods.

**COMPUTATION OF THREE DIMENSIONAL POTENTIAL FLOW AROUND A FINITE WING WITH A LEADING-EDGE DISCONTINUITY AT HIGH ANGLE OF ATTACK Ph.D. Thesis**
T. CHO 1985 219 p
Avail: Univ. Microfilms Order No. DA8523059

The aerodynamics of a finite wing above the stall angle of attack is investigated computationally. Vortex panel computer programs have been developed which can be used to calculate two dimensional separated flows over airfoils and three dimensional separated flow over a wing with leading edge droop modification. On each wind surface panel, a bound vortex is assumed to be distributed linearly in the spanwise direction and also in the chordwise direction. For the three dimensional flow around a finite thickness wing, the upper and lower surfaces are assumed to be independent infinitely thin wings located on top of each other. For three dimensional separated flow calculations, two different computational models are developed. One is a semi-empirical engineering model which is applied to an infinitely thin wing. The location of the separation and the pressure inside the separation region are provided from experiment. Inside the separation region, constant strength vortex panels are distributed corresponding to the constant pressure, Cp = -0.6, which is confirmed by various experiments.

**A VISCOUS-INVISCID INTERACTION METHOD TO PREDICT THE AERODYNAMIC PERFORMANCE OF AIRFOILS AT TRANSONIC SPEED**
K. MASUNO 1985 34 p refs In JAPANESE; ENGLISH summary
(NAL-TR-873) Avail: NTIS HC A03/MF A01

The present paper describes a calculation method for predicting the aerodynamic performance of single airfoils in the transonic flows of high Reynolds numbers. For the inviscid part of the method, a transonic full potential equation represented on an algebraically generated C-topology coordinate system is solved by a fully conservative AF2 iteration scheme. A finite difference method (PC-CN Scheme) is used for the boundary layer and wake solutions. In the viscous method, an algebraic turbulence model for the asymmetric near wake is also developed. The model used to achieve viscous-inviscid coupling is the equivalent source model. The wake thickness and curvature are taken into account. The calculations for turbulent wake flows indicated good agreement with the experimental data, and show that the velocity profiles across the wake and minimum velocities can be computed satisfactorily with the present method. Comparisons of the predictions with high Reynolds number wind tunnel experiments show good agreement for pressure distributions, lift and drag.

A vortex theory of screw/propellers with variable circulation according to the blade and its azimuth is proposed, the problem is formulated and circulation is expanded in a Fourier series. Equations are given for inductive velocities in space for crews, including those with an infinitely large number of blades and expansion of the inductive velocity by blade azimuth of a second screw. Multiparameter improper integrals are given as a combination of elliptical integrals and elementary functions, and it is shown how to reduce elliptical integrals of the third kind with a complex parameter to integrals with a real parameter. (NASA-TM-87627; L-16026; NAS 1.15:87627) Avail: NTIS HC A03/MF A01 CSCL 01A

An experimental investigation was conducted in the Langley 16-Foot Transonic Tunnel at free-stream Mach numbers from 0.70 to 0.82 and angles of attack from -2.5 to 4.0 degrees to determine the integration effects of pylon-mounted underwing forward and rearward separate-flow, flow-through nacelles on a high-wing transonic transport configuration. The results showed that the installed drag of the nacelle/pylon in the rearward location was slightly less than that of the nacelle/pylon in the forward location. This reduction was due to the reduction in calculated skin friction of the nacelle/pylon configuration. In all cases the combined value of form, wave, and interference drag was excessively high. However, the configuration with the nacelle/pylon in a rearward location produced an increase in lift over that of the basic wing-body configuration. Author

The boundary layer calculation program (BLAY) is a program code which accurately analyzes the three-dimensional boundary layer of a wing with an undefined plane. In comparison with other preexisting programs, the BLAY is characterized by the following: (1) the time required for computation is shorter than any other; (2) the program is adaptable to a parallel processing computer; and (3) the program is associated with a secondary accuracy in the z-direction. As a boundary layer modification to transonic nonviscous flow analysis programs, it is used to adjust viscous and nonviscous interference problems repeatedly. Its efficiency is an important factor in cost reduction in aircraft designing. Transl. by B.G.

**A NEW METHOD FOR LAMINAR BOUNDARY LAYER TRANSITION VISUALIZATION IN FLIGHT: COLOR CHANGES IN LIQUID CRYSTAL COATINGS**
B. J. HOLMES, P. D. GALL, C. C. CROOM, G. S. MANUEL, and W. C. KELLIHER Jan. 1986 9 p refs Original contains color illustrations
(NASA-TM-87666; NAS 1.15:87666) Avail: NTIS HC A02/MF A01 CSCL 01A

The visualization of laminar to turbulent boundary layer transition plays an important role in flight and wind-tunnel aerodynamic testing of aircraft wing and body surfaces. Visualization can help provide a more complete understanding of both transition location as well as transition modes; without visualization, the transition process can be very difficult to understand. In the past, the most valuable transition visualization methods for flight applications included sublimating chemicals and oil flows. Each method has advantages and limitations. In particular, sublimating chemicals are impractical to use in subsonic applications much above 20,000 feet because of the greatly reduced rates of sublimation at lower temperatures (less than -4 degrees Farenheit). Both oil flow and sublimating chemicals have the disadvantage of providing only one good data point per flight. Thus, for many important flight conditions, transition visualization has not been readily available. This paper discusses a new method for visualizing transition in flight by the use of liquid crystals. The new method overcomes the limitations of past techniques, and provides transition visualization capability throughout almost the entire altitude and speed ranges of virtually all subsonic aircraft flight envelopes. The method also has wide applicability for supersonic transition visualization in flight and for general use in wind tunnel research over wide subsonic and supersonic speed ranges. Author

**TWO METHODS FOR VISCOUS AND INVISCID FREE-WAKE ANALYSIS OF HELICOPTER ROTORS Final Report, 15 Feb. 1983 - 14 Apr. 1985**
L. MORINO and B. BHARADVAJ Aug. 1985 147 p
(Contract DAAG29-83-K-0050)
(AD-A161513; CCAD-TR-85-2; ARO-19797.3-EG) Avail: NTIS HC A07/MF A01 CSCL 20D

Two integral equation methods for the free wake analysis of helicopter rotors (for potential and rotational flows, respectively) have been presented. The rotational flow formulation is based upon Helmholtz scalar/vector-potential decomposition. The advantages of the rotational flow formulation over the potential flow formulation have been discussed. The numerical equivalence of the two methods have been demonstrated. It should be noted that (whereas in the potential flow problem viscosity may be introduced only as artificial viscosity) in the rotational-flow formulation the presence of viscosity is consistent with the formulation. Therefore, this formulation is applicable to the solution of time-averaged Navier-Stokes equations: in particular, a simplified thin-wake analysis with an elementary eddy-viscosity model for turbulence is used in the numerical applications. Analysis of the computer times indicates that the new formulation presented here (for rotational flows) has much broader applicability than the formulation for potential flows, while requiring approximately the same amount of computer time. **NUMERICAL ANALYSIS OF NONEQUILIBRIUM FLOW ABOUT AIRFOIL IN THIN SHOCK LAYER APPROXIMATION Abstract Only**
V. N. GOLUBKIN and V. V. NEGODA *In its* USSR Report: Physics and Mathematics (JPRS-UPM-86-003) p 5 5 Feb. 1986 Transl. into ENGLISH from Zhurnal Vychislitelnoy Matematiki i Matematicheskoy Fiziki (Moscow, USSR), v. 25, no. 4, Apr. 1985 p 599-608 Original language document was announced in IAA as A85-33593
Avail: NTIS HC A04

An efficient method is presented for solving nonlinear equations for a thin nonequilibrium shock layer on a low-aspect-ratio wing in hypersonic gas flow. The effect of the nonequilibrium of three-dimensional flow on the shape of the shock wave attached to the leading edge, pressure distribution, and the force and moment characteristics of the wing is discussed. Results of numerical calculations are presented. V.L

**VERIFICATION AND APPLICATION OF THE ICING SCALING EQUATIONS**
G. A. RUFF (Sverdrup Technology, Inc., Middleburg Heights, OH) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 25 p. refs
(AIAA PAPER 86-0481)

An experimental icing scaling research program was conducted at the Arnold Enginering Development Center which has verified a set of icing scaling equations for a limited range of icing conditions. By applying these equations, test conditions can be calculated so that ice accretion profiles are scaled to within the repeatability of the ice accretion measurement technique. The application of these scaling equations is discussed and a practical example of their solution is presented. Limitations of the method are also discussed. Author

**ULTRALIGHT AIRCRAFT - A NEED FOR BETTER REGULATION THAN 14 C.F.R. SECTION 103**
R. H. JACK (Jack and Jack, Athens, GA) Journal of Air Law and Commerce (ISSN 0021-8642), vol. 51, Winter 1986, p. 415-460. refs

The need to eliminate the hazards to other aircraft from uncertified operators of ultralight vehicles is examined. The development of ultralight vehicles and civil aviation safety regulations is reviewed. The use of congressional legislation and executive agencies' regulations to control the hazards of ultralights is described. Judicial remedies which include the use of mandamus or tort action to solve the inadequacies of ultralight vehicle regulations are studied. The implementation of a licensing system for ultralight vehicle operators similar to the ones of Canada and Great Britain is proposed. I.F.

(PB85-917001; NTSB/SS-85/01) Avail: NTIS HC A18/MF A01

Since 1982, the Federal Aviation Administration (FAA) has regulated the operation of ultralight vehicles under 14 CFR Part 103. Increasing numbers of reports of ultralights being operated in regulated airspace and for nonrecreational purposes made it apparent to the Safety Board that an evaluation of the effectiveness of the FAA's regulatory approach to ultralights was needed. In the absence of a systematic accident data collection process on which to base the analysis, the Safety Board in March 1983 decided to investigate all fatal accidents involving a powered ultralight and other selected powered ultralight accidents involving obvious safety issues. Between March 1983 and September 1984, the Safety Board investigated 177 ultralight accidents, of which 88 involved a total of 93 fatalities. The Safety Board has prepared a report which describes the safety problems identified through analyses of these accidents, explores safety concerns raised by organizations and associations interested in ultralights, and recommends improvements in existing ultralight safety measures, where appropriate. (Contract DTFA03-81-C-00040)
(DOT/FAA/CT-85/33) Avail: NTIS HC A04/MF A01

An air-to-ground impact test demonstration was conducted with a remotely piloted transport category airplane. The Full-Scale Transport Controlled Impact Demonstration Program (CID) is discussed. The program includes activities involved in the development and subsequent demonstration of an antimisting fuel experiment and experiments relating to improvements in cabin fire safety and structural impact protection. The results of structural experiments associated with two onboard galleys and overhead stowage compartments are reported. During the impact demonstration, both compartments remained in place without spillage of their internal contents, while the post crash fire resulted in minor galley damage and total destruction to the overhead compartments. **PARTICLE TRAJECTORY COMPUTATION ON A 3-DIMENSIONAL ENGINE INLET Final Report Ph.D. Thesis**

J. J. KIM Jan. 1986 115 p refs
(Contract NAG3-566)
(NASA-CR-175023; NAS 1.26:175023; DOT-FAA-CT-86-1) Avail: NTIS HC A06/MF A01 CSCL 01C

A 3-dimensional particle trajectory computer code was developed to compute the distribution of water droplet impingement efficiency on a 3-dimensional engine inlet. The computed results provide the essential droplet impingement data required for the engine inlet anti-icing system design and analysis. The droplet trajectories are obtained by solving the trajectory equation using the fourth order Runge-Kutta and Adams predictor-corrector schemes. A compressible 3-D full potential flow code is employed to obtain a cylindrical grid definition of the flowfield on and about the engine inlet. The inlet surface is defined mathematically through a system of bi-cubic parametric patches in order to compute the droplet impingement points accurately. Analysis results of the 3-D trajectory code obtained for an axisymmetric droplet impingement problem are in good agreement with NACA experimental data. Experimental data are not yet available for the engine inlet impingement problem analyzed. Applicability of the method to solid particle impingement problems, such as engine sand ingestion, is also demonstrated. Author

**A NUMERICAL AND EXPERIMENTAL INVESTIGATION OF ELECTROCHEMICAL AIRCRAFT DEICING M.S. Thesis Final Report**

K. L. LEFFEL Jan. 1986 268 p refs
(Contract NAG3-72)
(NASA-CR-175024; NAS 1.26:175024) Avail: NTIS HC A12/MF A01 CSCL 01C

This study was composed of three parts. The first part involved the extension of an existing transient two dimensional numerical code for an electrothermal deicer so that it would simulate the situation where a variable thickness ice layer existed at the outer surface. The Enthalpy Method was used to simulate the phase change, and Gauss-Seidel iteration was used to solve the resulting system of finite difference equations. A set of criteria were developed for determining when a variable thickness ice layer had an effect on deicer performance. The second part was the acquisition and analysis of experimental data. The test model was a section of a Bell UH-1H helicopter blade equipped with an electrothermal deicer. A total of fifty-two thermocouples were utilized to document the thermal response of the blade and decier assembly. In the deicing runs, the experimental temperature response data clearly showed when melting, shedding or refreezing occurred. The tests illustrated that the criterion for shedding in the three cases where it did occur was that the abrasion shield interface temperature was 32 to 34 F. The third part concerned the validation of a one dimensional transient thermal model of an electrothermal deicer by comparison of the predictions with the experimental data. The Enthalpy Method was found to effectively model the phase change which occurred, and the ice shedding algorithm employed in the simulation was also evaluated. Author

**AIRCRAFT ACCIDENT REPORT: AIR CANADA FLIGHT 797, MCDONNELL DOUGLAS DC-9-32, C-FTLU GREATER CINCINNATI INTERNATIONAL AIRPORT, COVINGTON, KENTUCKY, JUNE 2, 1983 Accident Report, 2 Jun. 1983**

31 Jan. 1986 118 p refs
(PB86-910402; NTSB/AAR-86-02) Avail: NTIS HC A06/MF A01 CSCL 01C

A fire aboard a McDonnell Douglas DC-9-32, at the Greater Cincinnati International Airport, Covington, Kentucky, and the death of 23 passengers is reported. A fire in the aft lavatory was discovered while in flight and an emergency descent was made. Airport support, escape measures, and fire fighting are described. It was determined that the probable causes of the accident were: (1) a fire of undetermined origin; (2) an underestimate of fire severity; and (3) misleading fire progress information provided to the captain. It is concluded that the time taken to evaluate the nature of the fire and to decide to initiate an emergency descent contributed to the severity of the accident. E.A.K.

**AIRCRAFT ACCIDENT REPORT: GALAXY AIRLINES, INC., LOCKHEED ELECTRA-L-188C, N5532, RENO, NEVADA, JANUARY 21, 1985**

4 Feb. 1986 89 p
(PB86-910401; NTSB/AAR-86-01) Avail: NTIS HC A05/MF A01 CSCL 01C

About 0102:30 Pacific standard time on January 21, 1985, Galaxy Airlines Flight 203, a Lockheed Electra charter flight en route to Minneapolis, Minnesota, departed runway 16R of the Reno-Cannon International Airport. Approximately one minute later, the crew requested a turn to a left downwind to return to the airport because of a vibration in the airplane. In accordance with the request, the tower controller cleared the flight to make a left turn to a downwind traffic pattern. The airplane crashed at 0104 into an area 1 1/2 miles from the departure end of runway 16R, and 3/4 mile to the right of the extended runway centerline. The impact and subsequent fire killed the crew of six and 64 of the 65 passengers onboard. The airplane was destroyed. The sky was clear and the visibility was 12 miles at the time of the accident. The National Transportation Safety Board determines that the probable cause of this accident was the captain's failure to control and the copilot's failure to monitor the flight path and airspeed of the aircraft. This breakdown in crew coordination followed the onset of unexpected vibration shortly after takeoff. Contributing to the accident was the failure of ground handlers to properly close an air start access door, which led to the vibration. Author

(Contract F33615-83-C-2359)
(AD-A161094; AFWAL-TR-85-2057) Avail: NTIS HC A09/MF A01 CSCL 01B

This manual was prepared to provide the aircraft mishap investigator with state-of-the-art data and guidelines for investigating aircraft fires and explosions. Sections are included on investigating procedures, properties of air atmospheres, properties of aircraft combustibles (liquids, gases, or solids), properties of ordnance explosives, and damage analyses relating to fires and explosions. Procedures for accumulating, developing, and analyzing the evidence are outlined, and various combustion data are summarized for use in determining the ignition source, combustible source, and mishap scenario. To help establish the mishap scenario, damage criteria are given in terms of material or biological response to fire temperatures, explosion pressures, toxic gases, and other potentially hazardous exposures. Methods for calculating combustion quantities and damage potentials, including material failures, are included in this manual. Author (GRA)

CSCL 01B

Full-scale cabin fire tests were conducted to determine potential increases in passenger survivability associated with different interior honeycomb panel constructions. The test fuselage was a C-133 with a simulated wide-body door opening exposed to an 8-foot by 10-foot fuel fire. In the first series, the interior near the door was lined with the honeycomb panels to determine whether earlier studies performed with small-scale enclosures were consistent with the full-scale counterpart. These earlier studies resulted in the selection of the Ohio State University (OSU) Rate of Heat Release Apparatus as the most appropriate type test to evaluate aircraft panels. The first series was followed by tests that included fire-blocked seats and carpeting as well as the panels to determine the type survivability increases that could be attained from low heat release materials. The scenario employed generally resulted with flashover within 2 minutes for panels considered typical in performance. A low heat release phenolic/fiberglass panel demonstrated a flashover delay until about 4 minutes into the test. An incombustible panel prevented flashover altogether. The performance of the various panels was evaluated to develop recommended flammability criteria for a modified OSU Rate of Heat Release Apparatus. GRA

**GENERAL AVIATION PILOT AND AIRCRAFT ACTIVITY SURVEY Final Report, 1984**
C. FRANK and J. OHMAN Sep. 1985 83 p Prepared in cooperation with Automated Sciences Group, Inc., Silver Spring, Md.
(Contract DTRS-57-84-C-00100)
(AD-A161665; TSC-FAA-85-7; FAA-MS-85-1) Avail: NTIS HC A05/MF A01 CSCL 14B

A summary and analysis of the data collected in the 1984 General Aviation Pilot and Aircraft Activity Survey is provided. The survey was conducted at a random sample of general aviation airports across the nation throughout the months of July, August, September, and October, 1984 by the Federal Aviation Administration with the assistance of the Civil Air Patrol. The survey data provide information regarding the magnitude and characteristics of general aviation including: type and source of weather information services, trip length in time and distance, and pilot age and certification. Estimates are made of total 1984 general aviation operations, fuel consumption and aircraft miles flown. GRA

**HELICOPTER FLIGHT TEST DEMONSTRATION OF DIFFERENTIAL GPS**
R. P. DENARO and J. BESER (TAU Corp., Los Gatos, CA) IN: Institute of Navigation, National Technical Meeting, San Diego, CA, January 15-17, 1985, Proceedings . Washington, DC, Institute of Navigation, 1985, p. 116-121. NASA-sponsored research. refs

An off-line post-mission processing facility is being established by NASA Ames Research Center to analyze differential GPS flight tests. The current and future differential systems are described, comprising an airborne segment in an SH-3 helicopter, a GPS ground reference station, and a tracking system. The post-mission processing system provides for extensive measurement analysis and differential computation. Both differential range residual corrections and navigation corrections are possible. Some preliminary flight tests were conducted in a landing approach scenario and statically. Initial findings indicate the possible need for filter matching between airborne and ground systems (if used in a navigation correction technique), the advisability of correction smoothing before airborne incorporation, and the insensitivity of accuracy to either of the differential techniques or to update rates. Author

**A SURVEY OF COMMERCIALLY AVAILABLE POSITIONING SYSTEMS**
S. R. SAMPSON (Cubic Corp., San Diego, CA) IN: Institute of Navigation, National Technical Meeting, San Diego, CA, January 15-17, 1985, Proceedings . Washington, DC, Institute of Navigation, 1985, p. 162-166.

The requirement to accurately position and track a moving aircraft, vehicle or vessel requires the user to select from an often bewildering array of commercial positioning systems. Each offers a different combination of range, accuracy, dynamics, operational modes and inherent limitations. This paper presents a tabular summary of the available commercial systems and their key specifications. Supporting text uses the transmitted frequency band to divide the systems into generic categories with generally common performance. Within each group, the characteristic capabilities and limitations are discussed. Topics include GDOP, calibration, multipath, skywave, propagation velocities, frequency allocation and measurement ambiguities. The reader will find the paper provides the basic navigation aids required to chart a safe course through the maze of systems available. Author

**A86-26442#**
**OMEGA - COMMERCIAL EXPERIENCES WITH A MATURE SYSTEM**
G. GIBBS (Canadian Marconi Co., Montreal, Canada) and H. BANSBACH (Litton Aero Products, Moorpark, CA) IN: Institute of Navigation, National Technical Meeting, San Diego, CA, January 15-17, 1985, Proceedings . Washington, DC, Institute of Navigation, 1985, p. 183-190. refs

The operation of Omega equipment within the commercial airborne community is reviewed. The development of the automated, economical navigation system which employs hyperbolic or rho-rho-rho principles is examined. The applications of Omega systems to land, sea, and air navigation by military and commercial operators are described and a list of commercial users of the system is provided. The problems encountered with the installation of the Omega receiver antenna on the aircraft, distinguishing short and long path signals, and the Omega coverage and signal geometry, and the facilities used to maintain the equipment are analyzed. I.F.

**A86-26443#**
**DECENTRALIZATION FILTERING AND REDUNDANCY MANAGEMENT/FAILURE DETECTION FOR MULTISENSOR INTEGRATED NAVIGATION SYSTEMS**
T. KERR (Intermetrics, Inc., Cambridge, MA) IN: Institute of Navigation, National Technical Meeting, San Diego, CA, January 15-17, 1985, Proceedings . Washington, DC, Institute of Navigation, 1985, p. 191-208. refs

Current failure detection isolation and reconfiguration procedures applicable to navigation systems are reviewed. The design of a failure detection/redundancy management technique which incorporates voter monitoring methodology, decentralized Kalman filter mechanization, and a semiautonomous multisensor navigation system is described. The technique involves the use of Gaussian confidence regions to account for the inherent difference in accuracy between the various sensor subsystems and on-line estimates of covariances from the Kalman filter are utilized for this assessment. The technique evaluates the probability of detecting failed component subsystems and the probability of false alarms to be incurred. The development of a Kalman filter on a chip is analyzed. I.F.

**A86-26444#**
**MICROWAVE LANDING SYSTEM (MLS)**
J. J. STRONG (Hazeltine Corp., Commack, NY) IN: Institute of Navigation, National Technical Meeting, San Diego, CA, January 15-17, 1985, Proceedings . Washington, DC, Institute of Navigation, 1985, p. 209-218.

The Microwave Landing System (MLS) which uses microwave frequencies in the 5000 MHz range and 200 operating channels to provide azimuth and elevation guidance, and continuous range information to aircraft is examined. A scanning beam concept in which the time differences between two scans of the azimuth and elevation antennas are measured to obtain angular guidance data is employed in the MLS. The azimuth, elevation and back azimuth stations, and data links of the MLS are described. The precision distance measuring equipment transponder produces range data and operates in initial and final approach modes. The implementation of the MLS worldwide for military and civilian applications, and the FAA's national implementation program for the MLS are discussed. I.F.

**A86-26501**
**INSTITUTE OF NAVIGATION, ANNUAL MEETING, 41ST, U.S. NAVAL ACADEMY, ANNAPOLIS, MD, JUNE 25-27, 1985, PROCEEDINGS**
Meeting supported by the Bell Aerospace Textron, Charles Stark Draper Laboratory, Inc., Dynamics Research Corp., et al. Washington, DC, Institute of Navigation, 1985, 124 p. For individual items see A86-26502 to A86-26512.

Among the topics discussed are: tensor products in signal processing for satellite navigation applications; satellite selection criteria for altimeter aiding of GPS; and application of GPS to weapons systems. Consideration is also given to commercial aviation GPS navigation set test flight data; civil helicopter flight; operations using differential GPS; onboard rendezvous navigation for the Space Shuttle; and Chinese commercial navigation systems. Additional topics include: Space Station navigation design issues; the contribution of handheld computers to space navigation in the future; and automatic sextant development for space applications. I.H.

**COMMERCIAL AVIATION GPS NAVIGATION SET FLIGHT TEST RESULTS**
A. K. BROWN and M. A. STURZA (Litton Aero Products, Moorpark, CA) IN: Institute of Navigation, Annual Meeting, 41st, Annapolis, MD, June 25-27, 1985, Proceedings . Washington, DC, Institute of Navigation, 1985, p. 41-48.

This paper presents lab test and flight test results obtained with the LTN-700 GPS Navigation Set. The LTN-700 is the first GPS Navigation Set specifically designed for commercial aviation applications. Its architecture was previously described at the ION National Technical Meeting, January, 1984. The difficulties encountered in instrumenting the flight tests of a system as precise as GPS are discussed. Static lab test results are shown to demonstrate absolute navigation accuracy. Flight testing of the LTN-700 has been conducted on Litton Systems' Merlin IV aircraft. Data is presented showing the receiver tracking performance in a commercial aviation environment. Comparative data showing the performance of the LTN-700 and a high quality Inertial Navigation System (INS) is provided. Other LTN-700 tests are also briefly described. Author

**CIVIL HELICOPTER FLIGHT OPERATIONS USING DIFFERENTIAL GPS**
F. G. EDWARDS (NASA, Ames Research Center, Moffett Field, CA) and P. V. W. LOOMIS (TAU Corp., Los Gatos, CA) IN: Institute of Navigation, Annual Meeting, 41st, Annapolis, MD, June 25-27, 1985, Proceedings . Washington, DC, Institute of Navigation, 1985, p. 54-63. refs

The results of NASA flight trials of a dual-receiver differential global positioning system (DGPS) for civilian helicopter navigation applications, are presented. The three principal components of the DGPS system are described, including the GPS ground-reference system, a range tracking system, and an on-board sequential GPS receiver. The ground-based receiver in the DGPS operates at a known fixed location and receives C/A code signals from NAVSTAR satellites. System bias errors in the ground receiver are subtracted from the airborne solution for the navigational fix. Calculations of the differential bias error are carried out using an on-board PDP-11/34 M research computer. The ground-reference differential corrections for satellites are given in a table. It is shown that the differential correction signal of the DGPS contains only a small (0.1 rad/sec) high-frequency component which can be attributed to system error. A schematic diagram of the DGPS postflight data processing routine is provided. I.H.

**A86-27128#**
**AIRCRAFT COUPLING MODEL EVALUATIONS AT SHF/EHF**
G. GENELLO and A. PESTA (USAF, Rome Air Development Center, Griffiss AFB, NY) IN: International Symposium on Electromagnetic Compatibility, Wakefield, MA, August 20-22, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 72-74. refs

Severe overcrowding of the RF spectrum, especially at UHF, has been one primary motivator to extend military communications into the SHF and finally the EHF band. The potential interference of placing new SHF/EHF terminals on-board existing and new aircraft platforms is unknown and must be assessed. Several EMC-related computer analysis programs are available to predict the coupling between aircraft antennas. However, the models contained in these codes may not be adequate for prediction analysis at these higher frequencies. Coupling measurements have been performed on a KC-135 style aircraft and a F-16 tactical fighter to evaluate the validity of the computer models. A comparison analysis of predicted and actual coupling data is presented. Author

**REAL-TIME TELEMETRY OF COMPLETE 1553 DATA BUSES**

P. M. BREEDLOVE and C. R. STEPHENS (Loral Corp., Loral Instrumentation, San Diego, CA) IN: ITC/USA/'85; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 28-31, 1985 . Research Triangle Park, NC, Instrument Society of America, 1985, p. 167-174.

As MIL-STD-1553 Multiplex Data Bus usage proliferates, the ability to remotely monitor bus traffic has become important. Common applications include flight testing of missiles and aircraft, and the field maintenance of vehicles. Due to the high data rate and asynchronous characteristics of the 1553 Data Bus special problems exist in the acquisition and analysis of 1553 bus traffic. The acquisition of the complete bus traffic is especially important during system testing and diagnostic operations. Several approaches are being utilized today to transmit 1553 bus traffic. The first approach is an extension of the PCM technique in which all of the bus traffic, during a specific time window, is buffered and then output in a PCM style format. This has the advantage of being synchronous, but a significant amount of bus information is lost, primarily the protocol and bus timing. An alternative approach is to transmit raw unbuffered bus traffic. Bus timing and protocol are retained, but the telemetry signal is asynchronous. A third approach, developed by Loral Data Systems in conjunction with Loral Instrumentation, is a 1553 Data Acquisition System that retains bus timing and protocol and synchronizes the signal to a common clock. **TSPI DATA PROCESSING IN THE TELEMETRY ENVIRONMENT**

G. REED (Computer Sciences Corp., Lompoc, CA) IN: ITC/USA/'85; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 28-31, 1985 . Research Triangle Park, NC, Instrument Society of America, 1985, p. 333-343.

Most test ranges are required to process both telemetry and Time Space Position Information (TSPI) data in real time. Using the Integrated Flight Data Processing System (IFDAPS) at Edwards AFB as an example, some of the basic differences between telemetry and TSPI data processing are identified and methods of integrating the two types of processing are discussed. Included for consideration in the integrated processing are data acquisition, measurement displays, recording, derived measurement computations using both types of data, and post flight merging of telemetry and TSPI data. Data processing is discussed in a concurrent, multiple operation environment using separate, integrated processors. Author

**REMOTE AIRCRAFT MAINTENANCE MONITORING USING TELEMETRY**

D. DOWLING and R. A. LANCASTER (ARINC Research Corp., Annapolis, MD) IN: ITC/USA/'85; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 28-31, 1985 . Research Triangle Park, NC, Instrument Society of America, 1985, p. 449-456.

The purpose of this paper is to present a concept utilizing digital telemetry links to upgrade the military aircraft maintenance approach in the future. The evolution of digital avionics in both military and commercial aircraft is creating changes that affect today's approach to maintenance. Commercial aviation has made significant progress in the direction of maintenance monitoring using a digital telemetry link. This paper presents the status of maintenance-monitoring efforts within the commercial airlines and, recognizing the differences that exist between the military and commercial application, proposes an aircraft maintenance concept for the military in the 1990s. **FREQUENCY SYNTHESIS TYPE AIRBORNE TRANSMITTERS**

W. MARTINI (Intertechnique, S.A., Departement Telemesures et Systemes, Les Ulis, France) IN: ITC/USA/'85; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 28-31, 1985 . Research Triangle Park, NC, Instrument Society of America, 1985, p. 575-585.

Two basic schemes for a frequency modulation type airborne telemetering transmitter are examined: a transmitter with transposition through mixing and filtering and a transmitter with phased-in servoing of the carrier to a reference after frequency division. The schemes are studied in terms of the ability to accept high base bands and the possibility of frequency synthesis that they offer. The reasons for the choice of one of these schemes and the resulting market reception in France are explained. Technical difficulties arising from the concept of a frequency synthesis transmitter are discussed. C.D.

**A PROCEDURE FOR THE EVALUATION AND ANALYSIS OF THE OPERATIONAL PRACTICABILITY AND EFFECTIVENESS OF AUTOMATED TRAFFIC FLOW CONTROL PROCEDURES FOR THE NEAR TERMINAL AREA [EIN VERFAHREN ZUR BEWERTUNG UND ANALYSE DER OPERATIONELLEN PRAKTIKABILITAET AUTOMATISIERTER VERKEHRSFLUSSSTEUERUNGSVERFAHREN FUER DEN FLUGHAFENNAHBEREICH]**

A. HOERMANN Berlin, Technische Universitaet, Fachbereich Verkehrswesen, Dr.-Ing. Dissertation, 1985, 215 p. In German. refs

The continuously increasing air traffic volume makes it necessary to enhance the capacity of the airports. The main aim of the present study is related to the development of criteria for an objective evaluation of competing automated flight management and air traffic control concepts in the Terminal Maneuvering Area (TMA), taking into account also an assessment of the effects of technological and/or operational modifications of system components. Details regarding the air traffic flow control in the TMA are discussed, giving attention to manual control in the near terminal area, the principles and algorithms of the control techniques, and the employment of automated control procedures. The Variable Path Speed Control (VPSC) procedure and the Fixed Path Speed Control (FPSC) procedure are examined. A simulation model is considered along with the program system TASIMD (Terminal area simulation program considering the aircraft dynamics), the derivation of a quality functional for a relative evaluation of the considered automated procedures and the results of an air traffic simulation. **FLIGHT MECHANICS CONTRIBUTIONS TO THE TIME-BASED TRAJECTORY CONTROL IN THE AIRCRAFT LONGITUDINAL PLANE [FLUGMECHANISCHE BEITRAEGE ZUR ZEITBEZOGENEN BAHNFUEHRUNG IN DER FLUGZEUGLAENGSEBENE]**

R. LUCKNER Braunschweig, Technische Universitaet, Fakultaet fuer Maschinenbau und Elektrotechnik, Dr.-Ing. Dissertation, 1984, 196 p. In German. refs

The continuously increasing volume of air traffic requires an enhancement of the capacity of air traffic systems. In this context, a transition is required from the air traffic systems of the third generation to the new systems of the fourth generation, which are distinguished by an extension of automation and subsystem integration. The present study is concerned with one vital aspect of the considered transition, taking into account the ability of future aircraft to fly along trajectories which are provided with respect to the path and the time at which a given point on this path has to be occupied by the aircraft (4-D navigation). An investigation is conducted regarding the phenomena of flight mechanics which arise in connection with the new requirements. It will be necessary to stabilize the aircraft with the aid of a position controller. Attention is given to the characteristics of time-based trajectory control, a mathematical model representing the involved problems, the compensation for errors regarding horizontal speed and position, positional control, and a simple control system. G.R.

**A86-27898**

**A NEW SYSTEM SIMULTANEOUSLY COVERING EN ROUTE NAVIGATION AND LANDING [UN NOUVEAU SYSTEME COUVRANT, A LA FOIS, LA NAVIGATION 'EN ROUTE' ET L'ATTERRISSAGE]**

M. SCHILLIGER (LMT Radio Professionnelle, Boulogne-Billancourt, France) Navigation (Paris) (ISSN 0028-1530), vol. 34, Jan. 1986, p. 15-27. In French.

The proposed system, derived from the standard TACAN, is suited for both civil and military applications. The ground beacon operates normally to perform the navigation function, but also transmits additional information needed for landing. On board, the received signals are processed together with the altitude information, and the result is displayed for the pilot on the navigation and ILS indicators. The extra data transmitted can cover several airfields in the vicinity of the ground beacon. Test results obtained with the Nord-260 aircraft and the SA-330 Puma helicopter are summarized. B.J.

**A86-27899**

**FLIGHT TESTS OF MLS ELEVATION GUIDANCE [ESSAIS EN VOL DU GUIDAGE EN SITE DU MLS]**

K. KOREMURA and T. KATANO (Ministry of Transport, Electronic Navigation Research Institute, Tokyo, Japan) Navigation (Paris) (ISSN 0028-1530), vol. 34, Jan. 1986, p. 63-72. In French.

The accuracy of the MLS elevation guidance subsystem is degraded owing to reflection and diffraction in the vicinity of the MLS antennas. This paper describes flight-test studies of these effects carried out by the Japanese Electronic Navigation Research Institute at Sendai Airport; the tests involved the use of an aircraft equipped with an MLS receiver, a telemetry system, and a TV tracking system. The results indicate that, even when the equipment is sited very unfavorably with respect to nearby buildings, a high guidance accuracy can be achieved if the approach is made along the median line; the accuracy is equal to one-third of the value defined by the SARP for the angle guidance ground subsystems of the MLS. B.J.

**A COMBINED OPTIMAL ALGORITHM FOR FILTERING AND CALCULATING NAVIGATION COORDINATES [OB'EDINENNYI OPTIMAL'NYI ALGORITM FIL'TRATSII I SCHISLENIIA NAVIGATSIONNYKH KOORDINAT]**

O. A. BABICH IN: Problems in aircraft reliability . Moscow, Izdatel'stvo Mashinostroenie, 1985, p. 71-82. In Russian.

The problem of filtering signals from the on-board transducers is formulated mathematically for the case of an excess number of measured parameters. A mathematical model of the errors of an inertial navigation system is examined, and coupling equations are presented. An analysis is also made of the errors of the on-board ranging system. A discrete-continuous algorithm for filtering and calculating coordinates is proposed which involves integrating eleventh-order differential equations and is almost as accurate as a full continuous algorithm. V.L.

**A86-28312**

**RELIABILITY OF AIRCRAFT NAVIGATION [NADEZHNOST' NAVIGATSII LETATEL'NYKH APPARATOV]**

A. A. KRASOVSKII IN: Problems in aircraft reliability . Moscow, Izdatel'stvo Mashinostroenie, 1985, p. 82-97. In Russian. refs

Navigation methods and the structure of navigational complexes are briefly reviewed, and an assessment is made of the reliability with which certain requirements for flight paths in real two- and three-dimensional space are satisfied and the time of arrival at specified navigation points is determined. The reliability of navigation is evaluated analyzing probabilities for a given set of events and determining the current probability density in the navigation coordinate space. V.L.

**NAECON 1985; PROCEEDINGS OF THE NATIONAL AEROSPACE AND ELECTRONICS CONFERENCE, DAYTON, OH, MAY 20-24, 1985. VOLUMES 1 & 2**

Conference sponsored by IEEE. New York, Institute of Electrical and Electronics Engineers, 1985. Vol. 1, 917 p.; vol. 2, 809 p. For individual items see A86-28327 to A86-28517.

Among the topics discussed are: signal processing; airborne computers and voice communications; and data transmission and fiber optics. Consideration is also given to: advanced computer architecture and hardware; airborne image processing; target recognition acquisition systems; and navigation systems. Additional topics discussed include: weapons guidance and interface; Kalman filtering methods; flight control design techniques; and software development and management for military aviation. I.H.

**A86-28335**

**A NOVEL VOICE ACTIVATED SWITCH (VOX) FOR HIGH NOISE ENVIRONMENTS**

R. VEMULA, E. LEE, and G. BOUKIS (Telephonics Corp., Huntington, NY) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 56-60.

A newly developed VOX circuit for detecting the speech characteristics of the cockpit noise background is described. The circuit consists of a 12-bit A/D converter which collects signal samples at a rate of 2500 samples per second. The A/D converter is clocked by counters which provide an appropriate clock rate for feeding the samples into a microprocessor. Before the signal is supplied to the converter, it is lowpass filtered to about 800 Hz. Timing measurements show that only 20 percent of the processor time is used to implement the circuit. An example of a speech waveform which was detected by the VOX circuit during performance tests is given in graphic form and a schematic diagram of the VOX circuit is provided. I.H.

**A DISTRIBUTED, FAULT-TOLERANT IMPLEMENTATION OF THE AIRBORNE DIGITAL MAP USING VLSI COMMON PROGRAMMABLE MODULES**

J. C. WAHTERA, J. B. PEARCE (Harris Corp., Melbourne, FL), O. M. CROMER, and S. S. SINOR (Westinghouse Electric Corp., Baltimore, MD) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 70-77. refs

The Digital Map Generator (DMG) provides an aircraft pilot with a full-color, planar map display for nap-of-the-earth flight. It also provides a digital terrain data base for use in advanced avionics functions such as terrain correlation and autonomous navigation. The DMG has been configured as a group of custom dedicated hardware processors implemented in conventional digital integrated circuits. As advanced aircraft are developed, requiring expanded capability and flexibility of digital map functions, advanced DMG architectures also must be developed. These architectures would be fault-tolerant, fully-integrated subsystems of general-purpose multiprocessors. This paper presents an advanced DMG architecture that implements the map functions in VLSI common programmable modules. The map function software is distributed among the processing modules, and execution is controlled by utilizing dynamic task allocation. Commonality of hardware and dynamic reassignment of tasks allows fault-tolerant techniques to be implemented and facilitates integration of other avionics functions within the same multiprocessor system. Author

**NAVIGATION METHODOLOGY - AN INVESTIGATION OF AN INERTIAL NAVIGATION SYSTEM (INS) ENHANCEMENT**

S. B. RICHTER and D. M. PARRY (Aydin Corp., Horsham, PA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 223-230. refs

To date, the utility of stored map data is proportional to the accuracy with which the aircraft's position is known. Inertial Navigation Systems (INS) rely heavily upon numerical integration techniques in order to locate the 'relative' position of aircraft and their associated targets. Current INS systems use the spherical modeling system. The INS subsystem at AYDIN is based upon the biaxial ellipsoidal system. Thus the accuracy with which the time and position requirements for certain mission-critical points are satisfied is dependent on the modeling system chosen. Author

**DESIGN TECHNIQUES FOR IMPROVED MAP-AIDED NAVIGATION**

C. A. BAIRD (Harris Corp., Melbourne, FL) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 231-238. refs

This paper presents techniques to effectively combine elevation and derived slope data from digital terrain elevation maps to improve the navigation accuracy of map-aided navigation systems. Elevation correlation processing is used to provide position fixes, signal-to-noise ratio estimates, and acquisition information. The details of this processing are examined using both analytical results and simulations. A modified Kalman filter is used to combine these position fixes with the navigator's position estimates, as well as provide updates using the derived slope data. The accuracy of the filter's error covariance estimates is emphasized. Throughout this work, simulations based on statistical map and error models, DMA maps, and flight test data are used for system design and evaluation. Tracking mode behavior is emphasized, but the difficult problem of acquisition from large position uncertainties is also addressed. Author

**MICROWAVE LANDING SYSTEM**

T. E. EVANS (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 239-243.

The National Microwave Landing System (MLS) program is a joint DOT/DOD/NASA effort to implement a common civil/military precision landing system to replace the current Instrument Landing System (ILS). The MLS will be capable of providing precision landing guidance down to Category III minimum while allowing for complex approach paths in both the horizontal and vertical planes. The system is based on the Time Reference Scanning Beam (TRSB) technique which was selected by the International Civil Aviation Organization (ICAO) in April 1978 as the new international landing system standard. MLS is less susceptible to interference from the surrounding area and provides a greater signal coverage area than ILS. Author

**DESIGN CONSIDERATIONS FOR DOPPLER VOR GROUND STATION ANTENNA ARRANGEMENT**

M. C. CHANDRA MOULY, S. SURENDER, C. DAMODARA RAO (VR Siddhartha Engineering College, Vijayawada, India), and G. VIJAY PRASAD (KL College of Engineering, Vijayawada, India) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 252-259. refs

Commonality of the airborne receiver for both VHF Omni Range (VOR) and Doppler VOR (DVOR) ground transmissions enforces certain restrictions on the DVOR signal format. This paper elucidates these restrictions and brings out the elegance of the DVOR system with respect to the terrain problems. Analytical methods to determine the number of Alford loops have been developed. Nyquist's sampling theorem has been employed for the evaluation of the minimum number. This work provides analytical support for the design of the DVOR ground station antenna arrangement. Author

**CONCEPT AND PERFORMANCE ANALYSIS OF A STRAPDOWN NORTHFINDER**

U. K. KROGMANN (Bodenseewerk Geraetetechnik GmbH, Ueberlingen, West Germany) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 260-267.

To determine the north direction with a strapdown northfinder, two components of the earth rate are measured with a dynamically tuned rotor gyro. This simple principle involves the problem that gyro errors and angular disturbances corrupt the useful sensor information. The effect of non-random time-varying drifts can be excluded by measuring the earth rate in different positions of the gyro with respect to the earth. A theoretically dynamic exact method for large angular disturbance rejection is derived and analyzed. It requires the incorporation of two inertial grade tilt - or acceleration-sensors and is based on the definition of an analytic virtual plane. By levelling this virtual plane the northfinder is exposed to an analytic fine leveling. Undisturbed rates signals are amenable within the virtual level loops for an accurate determination of the north direction. Author

### JTIDS RELNAV PERFORMANCE EVALUATION

M. S. MURPHY (VERAC, Inc., San Diego, CA) and J. LINDEGREN (USAF, Eglin AFB, FL) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 343-350.

The Joint Tactical Information Distribution System (JTIDS) Test Data Optimal Processor (JTIDS TDOP) has been developed, as a tool for the postflight assessment and error allocation of the JTIDS relative navigation (RELNAV) function, which is scheduled for testing during 1985/1986. The JTIDS TDOP utilizes advanced numerical techniques to implement an extended Kalman filter-based navigation smoothing algorithm, which integrates test data from JTIDS, INS, and test-range tracking instrument sources. The Optimal Processor will create accurate trajectory estimates, assess JTIDS RELNAV compliance to accuracy requirements, and analyze actual navigation errors into the contributing causes, thus providing a tool for DT&E test planning. The performance expected from the JTIDS TDOP system was tested on a simulated three-aircraft scenario. I.S.

**A86-28370**

### AN ADAPTIVE UD-FACTORIZED KALMAN FILTER FOR REAL-TIME TACTICAL AIRCRAFT TRACK-WHILE-SCAN SYSTEMS

R. M. YANNONE (General Electric Co., Utica, NY) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 358-363. refs

The application of an adaptive extended Kalman Filter (EKF) is described for removing divergence problems encountered by the use of Kalman filters in treating the kinematic data obtained in the track-while-scan radar mode. The eigenvector analysis used to examine the inherent discrete-time stability behavior of the Kalman filter is discussed, showing the filter stability to be a function of the state transition, Kalman gain, and measurement transformation matrices. An EKF, implemented by the UD factorization algorithm for gain and error covariance updates, was found to be part of the solution. The second part of the solution was to use sequential relinearization and an adaptive thresholding mechanism for selecting the process noise covariance matrix based on the range and the range rate measurement residuals. I.S.

**A86-28385**

### AUTONOMOUS LANDING GUIDANCE SYSTEMS

E. F. ROY (Kaiser Aerospace and Electronics Corp., Kaiser Electronics Div., San Jose, CA) and J. W. DAVISON (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 490-497. refs

The selection of the proper components for autonomous landing guidance systems for low visibility recovery of aircraft to battle damaged and repaired airfields is examined. The use of forward-looking infrared (FLIR) sensors with high resolution radar and flight guidance symbology instead of the instrument landing system is analyzed. The application of specific sensors is limited by the technical properties of the sensor, the effect of the atmosphere on the electromagnetic waveband of the sensor, and the characteristics of the scene. The capabilities and restrictions of active sensors such as pencil beam radar and side-looking airborne radar, and passive sensors such as FLIR and millimeter wave FLIR are described. The sensors performance during various weather conditions are evaluated. The incorporation of image processing techniques into the automomous landing guidance system for enhancement and integration of the data is discussed. A study of the image processing techniques reveals that median filter is the best method for noise removal and unsharp masking produces edge enhancement, resolution improvement, and contrast enhancement. I.F.

### DEMONSTRATION OF AN INNOVATIVE TECHNIQUE FOR TERRAIN FOLLOWING/TERRAIN AVOIDANCE - THE DYNAPATH ALGORITHM

R. V. DENTON, J. E. JONES, and P. L. FROEBERG (TAU Corp., Los Gatos, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 522-529. refs
(Contract F33615-83-C-3617)

Automated low-altitude maneuvering flight requires a Terrain Following/Terrain Avoidance capability as a central building block to exploit terrain masking while simultaneously assuring safe flight. This paper presents a new TF/TA optimization approach - the Dynapath Algorithm - to efficiently generate an optimum real-time TF/TA trajectory. It has been designed to be compatible with emerging programs that include terrain-masked threat avoidance as well. The optimization technique as described here is based on a dynamic programming approach that demonstrates how high-resolution and efficient coupling to the flight control system can be obtained. Preliminary computer results are provided to show how the approach results in tactically meaningful TF/TA trajectories. Author

**A86-28391**

### A COMPARISON OF DIGITAL TERRAIN MODELS AND TERRAIN MASKING ALGORITHMS

B. E. GINDELBERGER and F. J. STEENROD (BDM Corp., McLean, VA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 538-542.

Programs used for simulating scenarios involving aircraft and ground sites frequently need some type of terrain model and an algorithm to determine when masking occurs between two points. This paper describes three different terrain models and compares them. Each model was implemented on the same computer and several trials using identical flight paths were executed to derive these results. The comparison shows (1) how closely the different models match the results of each other, (2) the efficiency of each model in terms of processing time, and (3) the size of data files necessary to represent a region of terrain for each model. Author

### A SPEECH RECOGNITION RESEARCH TOOL FOR THE C-130 HERCULES

C. M. BREEVOORT (Lockheed-Georgia Co., Electronics Research and Development, Marietta, GA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 966-969.

Ongoing efforts aimed at providing flexible and reconfigurable research tools for speech recognition, particularly to assist aircraft flight crews, are discussed. The primary advantage for such a system is that a vocal exchange permits pilots to receive information and operate systems while continuing to use their eyes and hands for more critical tasks. Issues examined include: flexibility for the human factors engineer; flexibility for the digital signal processing engineer; and a user-programmable speech recognizer. Much work remains to be done in software development before one can claim 'better than 99 percent' accuracy with the speech recognizer in the cockpit environment aboard the Hercules test-bed aircraft. D.H.

**A86-28447**

**A SPEECH PROCESSING SYSTEM FOR AN AIR TRAFFIC CONTROL RADAR SIMULATOR**

R. LAWSON (Gould, Inc., Simulation Systems Div., Melville, NY) and J. DAMOULAKIS (Gould Research Laboratories, Rolling Meadow, IL) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 987-989.

A proposed speech control system to replace Track Control Consoles or TCCs (for an air-traffic-control radar simulator) ordinarily operated by pseudo pilots is described. Such Track Control Consoles are manned by personnel who perform the boring task of altering the tracks of simulated aircraft by entering keyboard data in response to the commands from the trainee controller. A speaker-dependent voice recognition system is substituted for the track altering function of each TCC, while a voice synthesis system is substituted for the pilot acknowledgment function. An interface is then created which allows the TCCs to remain in the loop and assume dual aircraft control, should the need arise. A software control system is utilized which permits the rapid movement of voice data from mass storage (on floppy and hard disks) to allow for operation with the required vocabulary. In addition, the relationship between the air traffic control vocabulary and memory requirements is shown, as is the architecture of the proposed system. Finally, the savings in person hours is projected over a typical training scenario for one year of operation. D.H.

**A86-28470#**

**THE EFFECTS OF ATMOSPHERIC TURBULENCE ON AN AIR-TO-AIR OPTICAL COMMUNICATION LINK**

J. N. KANAVOS (USAF, Foreign Technology Div., Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1174-1182. refs

An analysis is presented of the performance of an optical communications link between aircraft, evaluating the effect of atmospheric turbulence on bit error rate. It is assumed that a direct detection scheme is used with pulse code modulation of the on/off keying type; the optical beam has plane wave characteristics; the optical beam is assumed to be at constant altitude; and the atmosphere is assumed to be moving rather than the aircraft. Statistical techniques are used to describe the time-varying intensity fluctuations. Important quantities are: the probability distribution of the intensity fluctuations, the refractive index structure constant, and the intensity fluctuation power spectral density. It is found that an appropriate choice of altitude level could minimize a link's bit error rate while maximizing its reliable communication range. D.H.

**A86-28473**

**THE DEVELOPMENT STATUS OF JTIDS DUAL MODE TDMA AND DISTRIBUTED TDMA (DTDMA) FULL SCALE DEVELOPMENT TERMINALS - AN UPDATE**

J RUBIN (ITT, ITT Avionics Div., Nutley, NJ) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1206-1214. refs

The successful transition of terminal development featuring the JTIDS (Joint Tactical Information Distribution System) DTDMA (Distributed Time Division Multiple Access) architecture, from the advanced development model phase to the full scale development model phase has been achieved. This next generation C-cubed/C-N-I architecture is claimed to offer the potential for significant improvements in system and terminal data rate capacity, jam resistance, security, reliability, flexibility and a reduced probability of enemy exploitation, at an affordable price. D.H.

**A86-29300**

**GPS AIDED INERTIAL NAVIGATION**

J. T. NIELSON, G. W. SWEARINGEN, and A. J. WITSMEER (Boeing Aerospace Co., Seattle, WA) IEEE Aerospace and Electronic Systems Magazine (ISSN 0885-8985), vol. 1, March 1986, p. 20-26.

The Global Positioning System is an extremely accurate satellite-based navigation system which, after its completion in 1989, will provide users worldwide, 24 hour, all weather coverage. A joint research project among Boeing, Rockwell-Collins, and Northrop has been completed in which a GPS receiver was integrated with a low-cost strap-down inertial navigation system and a flight computer. A Kalman filter in the latter allows in-flight alignment and calibration of the INS. In addition, feedback from the INS to the GPS receiver improves the system's ability to reacquire satellite signals after outages. The resulting system combines the accuracy of GPS with the jamming immunity and autonomy of inertial navigation. System tests were conducted in which a Boeing owned T-33 jet aircraft was flown through known test patterns to align and calibrate the INS. Earlier tests, including test against an airborne jammer, were conducted in a modified passenger bus. Author

**A SATELLITE SYSTEM FOR AERONAUTICAL DATA COMMUNICATIONS**

W. A. SANDRIN and D. W. LIPKE (COMSAT, Clarksburg, MD) IN: Communication Satellite Systems Conference, 11th, San Diego, CA, March 17-20, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 12-17. COMSAT-sponsored research.
(AIAA PAPER 86-0602)

A system is described that can provide data communications via satellite to transoceanic commercial aircraft. The system will provide both air traffic control and airline company communications data services, and will require only modest satellite capacity operating at L-band. If this capability can be provided by the INMARSAT space segment, cost benefits will be realized through the sharing of satellites and earth stations in the INMARSAT system. Attention is also given to designs which minimize aircraft equipment costs, in part by the use of low-gain, flush-mounted aircraft antennas. Low data rates are assumed (200 to 400 bit/s), using DPSK modulation and a rate 1/2 convolutional code with interleaved code symbols and soft-detection Viterbi decoding. This modulation/coding scheme was chosen to provide reliable operation in the multipath fading environment. A brief description of the recommended system is given, followed by a discussion of propagation, aircraft antenna, modulation and coding, acquisition and synchronization, and network design issues. **DETECTION OF NON-MOVING TARGETS BY AIRBORNE MM-WAVE RADARS**

S. A. HOVANESSIAN (Hughes Aircraft Co., El Segundo, CA) Microwave Journal (ISSN 0026-2897), vol. 29, March 1986, p. 159, 160, 162 (3 ff.). refs

The mathematical relations involved in studying the conditions for the detection of a stationary ground target by airborne mm-wave radars are briefly examined, and questions of atmospheric attenuation are explored. For specified radar and target parameters, computer programs can be written to compute target, clutter, and rain backscattering S/N as a function of range, including atmospheric attenuation. Attention is given to numerical examples of stationary ground targets, numerical results, the detection of hovering helicopters against hilly background, and calculations regarding the detection ranges of hovering helicopters against hilly background. **INTERPOLATION OF HEIGHTS AND SLOPES FROM A DIGITAL TERRAIN ELEVATION MODEL**
R. F. SCOTT May 1982 12 p
(BAE-BT-13198) Avail: Issuing Activity

An interpolation scheme for the TERPROM navigation system, that combines third order polynomials in the x and y directions to obtain a continuous surface which fits the terrain model exactly, conforming to whatever degree of intricacy the model can provide, is outlined. It is recommended that flights where deterioration occurred over rugged country are re-run with this interpolation to determine improvements in accuracy. Author (ESA)

**EVALUATION OF THE FAA DESIGN PROCEDURES FOR HIGH TRAFFIC VOLUME PAVEMENTS Report, Jan. 1983 - May 1984**
S. D. KOHN Oct. 1985 144 p refs
(Contract DTFA01-81-Y-10555)
(DOT/FAA/PM-84/14) Avail: NTIS HC A07/MF A01

The results of a field study of the performance of high traffic volume airfield pavements is presented. Both rigid (portland cement concrete) and flexible (asphalt concrete) pavements were included in the study. Condition surveys and nondestructive testing were performed on the pavement sections in order to measure present performance and estimate load-carrying capacity. Traffic and material properties data were also collected for each pavement section. These parameters were used to compared thicknesses obtained using the current FAA design procedure and the thicknesses of the existing sections in order to evaluate the adequacy of the current design procedures. In general it was found that the design procedures are adequate; however, further field study has been recommended in order to verify collected data. Author

**PERFORMANCE OF A COMMERCIAL TRANSPORT UNDER TYPICAL MLS NOISE ENVIRONMENT Final Report**
J. K. HO Feb. 1986 55 p refs
(Contract NAS1-17635)
(NASA-CR-178032; NAS 1.26:178032; D6-57212) Avail: NTIS HC A04/MF A01 CSCL 17G

The performance of a 747-200 automatic flight control system (AFCS) subjected to typical Microwave Landing System (MLS) noise is discussed. The performance is then compared with the results from a previous study which had a B747 AFCS subjected to the MLS standards and recommended practices (SARPS) maximum allowable noise. A glide slope control run with Instrument Landing System (ILS) noise is also conducted. Finally, a linear covariance analysis is presented. Author

**ALGORITHMS FOR THE AUTOMATIC FOUR-DIMENSIONAL GUIDANCE OF AIRCRAFT, TAKING INTO ACCOUNT THE CURRENT WIND SITUATION**
W. LECHNER Oct. 1985 106 p refs Transl. into ENGLISH of "Algorithmen zur automatischen 4 dimensionalen Flugbahnfuehrung unter Beruecksichtigung der momentanen Windsituation" Rept. DFVLR-FB-84-40 Brunswick, West Germany, Sep. 1984
(ESA-TT-908; DFVLR-FB-84-40) Avail: NTIS HC A06/MF A01

An automatic time-of-arrival control flight mode covering the terminal maneuvering area was developed for the digital flight-control system of the HFB 320 test aircraft and flight tested. The algorithms used for computing four dimensional flight paths taking into account the current wind situation are described. Methods for measuring, filtering, and predicting the wind vector are developed and discussed with reference to the results of the flight tests. Evaluation shows that time error limits of + or - 5 sec can be achieved under varied wind situations. The aircraft-oriented method of wind prediction by extrapolation, based on the Kalman filter method, proves to be particularly efficient. Author (ESA)

**FLIGHT TESTING OF AN ASW HELICOPTER**
C. R. GUY and M. J. WILLIAMS (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia) (Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984) Vertica (ISSN 0360-5450), vol. 9, no. 4, 1985, p. 317-330. refs

A programme of flight trials carried out with a Sea King Mk 50 anti-submarine warfare helicopter is described. An outline is given of the aircraft instrumentation, the data-acquisition system and the data-analysis procedures. Results are presented for conditions of trimmed level flight together with typical examples of dynamic response tests, transition manoevres and Doppler and cable hover tests. The flight trials programme was designed to provide results both for use in the validation of a mathematical model of the Sea King helicopter and for more general use in helicopter flight behaviour studies. **APPLICATION OF MODERN STRUCTURAL OPTIMIZATION TO VIBRATION REDUCTION IN ROTORCRAFT**
P. FRIEDMANN (California, University, Los Angeles) (Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984) Vertica (ISSN 0360-5450), vol. 9, no. 4, 1985, p. 363-376. refs
(Contract NAG2-226)

This paper explores a number of techniques which are capable of reducing vibration levels in rotorcraft by redistributing the mass and stiffness properties of the structure. First, vibration reduction in the rotor is considered by using formal structural optimization for ensuring optimal frequency placement. Two cases are considered: in the first case aeroelastic constraints are not enforced and the blade is designed for minimum weight; in the second case aeroelastic constraints are enforced and vibration levels are minimized in forward flight. Next, vibration reduction in the fuselage is considered and the various methods available for vibration reduction by local structural modification are reviewed. The feasibility of combining local structural modification with modern structural optimization is discussed and some extensions of previous research are suggested. Author

**OPTIMAL DESIGN OF COMPOSITE POWER TRANSMISSION SHAFTING**

J. W. LIM and M. S. DARLOW (Rensselaer Polytechnic Institute, Troy, NY) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 13 p. refs

(Contract DAAG29-82-K-0093)

The replacement of a conventional drive shaft system with a composite drive shaft system with the same transmitted power is studied. As an illustration, the optimal design of a graphite/epoxy tail rotor drive shaft for the next generation of helicopters is considered. The background for the optimal design of a composite tail rotor and synchronization drive shafts is examined, taking into account torsional and lateral vibration. A computer algorithm for the optimal design of the drive shaft is discussed. The parameters of the optimized drive shaft are given and compared with conventional aluminum drive shaft values. It is shown that a composite shaft with a single tube operating supercritically at 6000 rpm can reduce the system weight by as much as 63.1 percent compared to the conventional shaft. The results of a parametric study of the composite shaft are reported, and trends of the optimal design of composite drive shafts are summarized. C.D.

**ANALYSIS OF THE WING/ROTOR AND ROTOR/ROTOR INTERACTIONS PRESENT IN TILT-ROTOR AIRCRAFT**

D. R. CLARK (Analytical Methods, Inc., Redmond, WA) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 16 p. refs

An advanced configuration modeling program has been used to analyze the aerodynamics of a representative tilt-rotor/wing combination in both hover and (helicopter) forward flight. The program which combines a panel representation of the wing and a blade element model of the rotor system provides a fully coupled solution of the loads on both components. Results are presented for hover and forward flight conditions for isolated rotor, side-by-side rotors and rotor plus wing configurations and include integrated wing and rotor loads, detailed rotor blade loads and off-body flow field surveys showing the effect of rotor and wing flow in the region of possible tail locations. Author

**IDENTIFICATION AND VERIFICATION OF FREQUENCY-DOMAIN MODELS FOR XV-15 TILT-ROTOR AIRCRAFT DYNAMICS**

M. B. TISCHLER (NASA, Ames Research Center; U.S. Army, Aeromechanics Laboratory, Moffett Field, CA), J. G. M. LEUNG, and D. C. DUGAN (NASA, Ames Research Center, Moffett Field, CA) (Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 17 p. Previously announced in STAR as N84-34445. refs

Frequency-domain methods are used to extract the open-loop dynamics of the XV-14 tilt-rotor aircraft from flight test data for the cruise condition (V = 170 knots). The frequency responses are numerically fitted with transfer-function forms to identify equivalent model characteristics. The associated handling quality parameters meet or exceed Level 2, Category A, requirements for fixed-wing military aircraft. Step response matching is used to verify the time-domain fidelity of the transfer-function models for the cruise and hover flight conditions. The transient responses of the model and aircraft are in close agreement in all cases, except for the normal acceleration response to elevator deflection in cruise. This discrepancy is probably due to the unmodeled rotor rpm dynamics. The utility of the frequency-domain approach for dynamics identification and analysis is clearly demonstrated. Author

**A86-27663#**

**STRUCTURAL DYNAMIC ASPECTS OF ROTOR ANTIRESONANT ISOLATION**

J. STOPPEL (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 9 p.

The efficiency of the nodal isolation system ARIS based on special antiresonance isolator elements is theoretically and experimentally confirmed using the BK 117 helicopter. It is demonstrated that, when a natural frequency and the antiresonance frequency coincide, the isolator compensates the resonance. This zero compensation in the undamped system can impair the isolating effect for a real damped structure with many modes close to the 4/rev range. The use of finite element methods for eigenvalue analysis and frequency response can be used to predict vibration problems and perform needed modifications. C.D.

**A86-27820**

**ROTATING AERODYNAMIC EXCITERS FOR IN-FLIGHT FLUTTER TESTING**

M. PENNACHIONI (Centre d'Essais en Vol, Base d'Essais, Istres, France) IN: ITC/USA/'85; Proceedings of the International Telemetering Conference, Las Vegas, NV, October 28-31, 1985 . Research Triangle Park, NC, Instrument Society of America, 1985, p. 587-601.

Structural excitation as observed in-flight flutter testing is considered along with the principles of the 'Colibri' exciters, the design of an in-flight excitation system, aspects of model building, and preliminary tests. Two Colibri units were built, including a low-power unit designed to validate the method by the in-flight testing of a light aircraft, and a medium-power units for an actual test on a large military transport aircraft modified by the installation of pods under its wings. It is found that using the rotating fin method to define an aerodynamic structural exciter leads to an answer which can be usefully combined with existing methods. This principle can be used to design and produce a family of exciters with forces in the range from a few Nextons to a few hundred Nextons. G.R.

**ATR42 - FIRST OF A FAMILY**

D. LEARMOUNT Flight International (ISSN 0015-3710), vol. 129, Feb. 15, 1986, p. 24-29.

The design of Aerospatiale/Aeritalia's simple low-production-cost ATR42 regional airliner is described with efficiency achieved through advanced wing desig and lightness of the aircraft. There is extensive use of composite materials and the cockpit design features flightdeck controls that include a CRT display electronic flight instrument system, an electronic attitude director indicator, an electronic horizontal situation indicator, and a flight computer which controls the standard issue autopilot. Decisions to apply new technology, as well as the selection of more conventional features such as a mechanical control system, were based on simplicity in installation and maintenance, and cost effectiveness. To achieve quietness in the cabin the engines are mounted as far out on the wings as asymmetric engine control would allow, resulting in an unusually large vertical unit design. The aircraft is powered by two PW120 turboprops rated at 18 shp and has a maximum speed of 268 kt. R.R.

**LIGHT AIRCRAFT - THE WAY AHEAD IN DESIGN AND OPERATION; PROCEEDINGS OF THE SYMPOSIUM, LOUGHBOROUGH, ENGLAND, MARCH 31, APRIL 1, 1984**

Symposium sponsored by the Royal Aeronautical Society and Loughborough University of Technology. London, Royal Aeronautical Society, 1984, 217 p. No individual items are abstracted in this volume.

The present symposium on contemporary design practices in small general aviation and ultralight aircraft gives attention to guidelines for the scaling and integration of structural and component system features. Among the topics discussed are representative new designs for these classes of aircraft (such as inflatable airframe structures and motor-powered parachutes), the performance characteristics of two- and three-surface unconventional configurations, and a parametric study of light twin-engined aircraft. Also treated are light aircraft manufacture, including home-building with composite materials, as well as modern aircraft engine components, cockpit design, and low cost operation of light aircraft. O.C.

**HELICOPTER AIRWORTHINESS SYMPOSIUM, 19TH, LONDON, ENGLAND, DECEMBER 19, 1984, PROCEEDINGS**

Symposium sponsored by the Royal Aeronautical Society. London, Royal Aeronautical Society, 1985, 149 p. No individual items are abstracted in this volume.

Various papers on helicopter airworthiness are presented. The topics addressed include: helicopter structural integrity in relation to airworthiness, strategy for the fatigue substantiation of helicopter dynamic components, monitoring of rotorcraft dynamic systems, and health and usage monitoring system developments in helicopters. Also discussed are: flight aspects, mechanical component health monitoring, crashworthiness of helicopters, and the W30-300 and compliance with HARP. C.D.

**ELECTROMECHANICAL ACTUATION RELIABILITY AND SURVIVABILITY**

K. A. HAIR (Grumman Aerospace Corp., Bethpage, NY) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 596-603. refs

The level of fault tolerance, desired failure characteristics, and post failure performance of electromechanical actuation systems (EMASs) are evaluated. The designing of EMASs to specific levels of performance is discussed. The features of EMASs which improve reliability and survivability include the multimotor configuration, active isolation of a failure channel with breaks or clutches, and the ability to remotely mount the components; however, the need for redundancy due to the gearbox causes an increase in the weight and size of the actuators. Failure mode effects and criticality analysis were performed on an EMAS and an electrohydraulic actuator (EHA) for the F-14 aircraft. The data reveal that the EHA design has less failure modes and is therefore more reliable; however, the EMAS has a 49 percent probability of a kill compared to 76 percent for the EHA displaying the greater survivability of the EMAS. I.F.

**A86-28398**

**ELECTRONICS FOR ADVANCED ELECTROMECHANICAL ACTUATORS DESIGN CONSIDERATIONS**

M. B. MCCORMICK (Kollmorgen Corp., Inland Motor Div., Radford, VA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 604-610.

The design process for an electronic controller for an electromechanical actuator (EMA) is studied. Controller specifications and general system specifications for an EMA system are described. The formation of a functional block diagram, and the breadboarding and testing of the individual functional blocks are examined. The need for good communication with the customer in order to produce the desired final product is discussed. I.F.

**A86-28400**

**DIGITAL FAULT TOLERANT FLIGHT ACTUATION SYSTEMS**

H. H. BELMONT (Northrop Corp., Aircraft Div., Hawthorne, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 618-627.

(Contract F33615-80-C-3623; AF PROJECT 2403)

A study was made of the equipments making up a typical flight control actuation system (servo electronics, servo valves, actuators and transducers) to determine where digital technology could replace analog technology for the purpose of providing a more fault-tolerant flight control actuation system. The investigation led to an evaluation of architectural design issues such as where to locate the servo electronics, the adequacy of military standard serial bus systems for control (versus data) applications, and the feasibility of providing electronics which could survive severe environments. Several actuation system configurations were evaluated which led to recommending, as the best developmental prospect, a concept of a locally integrated actuation system consisting of servo electronics, servo valves, actuators and transducers, interfacing with a digital flight control computer over a serial bus. ### A SURVIVABLE FLY-BY-WIRE SPOILER ACTUATION SYSTEM FEATURING NONFLAMMABLE FLUID, 8,000 PSI HYDRAULICS AND DIRECT DRIVE VALVES

R. WHITAKER, A. HARMON (Lockheed-Georgia Co., Marietta), and L. HAYNES (E-Systems, Inc., Montek Div., Salt Lake City, UT) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 633-640. refs

The occurrence of a total of 90 hydraulic fluid fire mishaps during the time from 1970 through 1975 has demonstrated the need to reduce the susceptibility of USAF aircraft to hydraulic fluid related fires. The most significant progress toward such a reduction is currently related to the development of a truly nonflammable hydraulic fluid, CTFE (AO2). Problems arise, however, in connection with the higher mass density of the new fluid. In an attempt to overcome these problems, a joint development program is conducted by two American aerospace companies. The program has the objective to produce an advanced, fireproof, survivable, spoiler actuation system for critical in-flight testing in a High Technology Test Bed (HTTB) aircraft in early 1986. In a system description, attention is given to a roll control system, hydraulic systems, the spoiler servoactuation system, design requirements, and a servoactuator. G.R.

**A86-28405**

### AN EXPERT SYSTEM FOR INTEGRATED AIRCRAFT/ENGINE CONTROLS DESIGN

J. H. TAYLOR (General Electric Co., Control Technology Branch, Schenectady, NY) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 661-669. refs

In this paper, we discuss the concepts, requirements and architecture for an expert system for integrated aircraft/engine control systems analysis and design. The purpose of this concept is to provide a high-level environment embodying expertise from the many fields that enter into integrated flight and engine controls design (aerodynamics, structures, propulsion, pilot/aircraft interaction, mission performance requirements, control system design and validation), thereby facilitating the design of integrated aircraft control systems and ensuring that the best possible designs are obtained. The expert system concept also has capabilities to handle data-base management, and to take maximum advantage of existing conventional software. A prototype expert system has been implemented that demonstrates many of the capabilities and benefits of such an environment. A record of a hypothetical controls system modeling, analysis, and design session is included in this paper. Author

### ARMY 21 - AVIATION

C. A. FRY (U.S. Army, Human Engineering Laboratory, Aberdeen Proving Ground, MD) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1046-1049. refs

An Army perspective is presented for the 'ideal' Army helicopter cockpit of the future. The tactical necessities which drive cockpit design are reviewed. Aircrew functions, communications, secondary systems, mission execution and general configuration are discussed with regard to the helicopter that will be needed in the 2010 time frame. Artificial intelligence technologies as well as sensors and display systems will be key elements. D.H.

**A86-28455#**

### 2010 - THE SYMBIONIC COCKPIT

J. M. REISING and R. W. MOSS (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1050-1054. refs

The cockpit of the year 2010 is described in terms of both the capabilities and systems it contains and how the pilot interacts with it. A brief mission narrative is provided describing several hours in the life of the Manta air superiority fighter. This is followed by a discussion of the [illegible] interface components employed in the cockpit including [illegible] voice, instrument panel display, canopy display, and holographic display systems. The concept of a 'symbionic' system is then introduced, describing in some detail the capabilities and features of a cockpit system that senses the physiological and mental state of the pilot and responds accordingly. Finally, conclusions and predictions are made that summarize and emphasize the points made in the paper. Author

### UNIFIED EM TRANSIENT PROTECTION REQUIREMENTS FOR AIRCRAFT AVIONICS LINE REPLACEABLE UNITS

G. W. KETTERLING (Boeing Military Airplane Co., Seattle, WA), R. C. VOGEL, and S. M. BRIGGS (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1310-1319. refs

Unified test requirements and procedures are suggested to achieve a specified inherent transient protection level to transients originating from lightning, NEMP (nuclear electromagnetic pulses), and intrasystems transients. The procedures presented provide a minimum set of test requirements, methods, and procedures that can be utilized to achieve a reasonable and attainable level of equipment inherent protection based on actual test results. Threat environments and transient frequencies dealt with under the procedures are indicated. D.H.

**A86-28514**

### LIGHTNING SIMULATION TESTS ON A GRAPHITE/EPOXY AIRPLANE MOCKUP

D. B. WALEN (Boeing Military Airplane Co., Seattle, WA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1570-1575.
(Contract F33615-82-C-3406)

Two test techniques to characterize aircraft and circuit responses to lightning environments were demonstrated on a graphite/epoxy F-16 mockup and the results are presented in this paper. Low-level swept-frequency transfer functions were measured using computer-controlled network analyzers. These frequency domain measurements required low drive current levels typically less than one ampere. Moderate level current pulse responses were measured using a crowbarred marx generator. The drive current exceeded 20 kA with a 4 x 10 to the 10th A/s peak rate of rise. The test technique demonstration showed that both low level swept-frequency transfer function measurements and moderate level current pulse tests can be used to simulate aircraft responses to lightning environments. **A NEW AND LESS COMPLEX ALTERNATIVE TO THE HANDLEY PAGE SLAT**
A. L. WILLIAMS (Northrop Corp., Aircraft Div., Hawthorne, CA) Journal of Aircraft (ISSN 0021-8669), vol. 23, March 1986, p. 200-206. refs

A comparative evaluation is made of the aerodynamic effects and mechanical requirements of devices that have been adopted to delay leading edge stall, such as the Handley Page slat and Kruger flap. While a flexible fiberglass Kruger flap that incorporates the 'ever-opening spiral' geometry allows high lift coefficient to be achieved at high inflow angles, it is a mechanically complex device; attention is accordingly given to the design features and advantages of an ever-opening spiral principle four-bar linkage device that answers to such criteria as compactness. The simplicity thus achieved has led to time and cost reductions in design, fabrication and maintenance. The device may be retrofitted to update existing aircraft. O.C.

**IN-FLIGHT SIMULATORS**
J. BARRY, JR. (USAF, Wright-Patterson AFB, OH) and A. E. SCHELHORN (Calspan Corp., Buffalo, NY) IEEE Aerospace and Electronic Systems Magazine (ISSN 0885-8985), vol. 1, March 1986, p. 10-16. refs

The Flight Dynamics Laboratory (FDL) has sponsored and managed the development and use of several generations of in-flight simulators during the last thirty years. These vehicles were designed and fabricated, and are operated by the Flight Research Department of Calspan Corporation, Buffalo, New York. These unique aircraft have been used to develop control laws and control systems, to evaluate new aircraft before first flight, to provide specialized training for test pilots, to perform essential flight research in flying and handling qualities, and to develop and validate the military specifications for handling qualities of piloted airplanes. As aircraft and control systems have become more complex and capable, systems integration issues have required more and more effort resources. Author

**CAD/CAM SUPPORTS FLIGHT TEST MODIFICATIONS**
J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 6, March 1986, p. 22-27.

An evaluation is made of an aircraft modification/modernization program that incorporates state-of-the-art computer-integrated engineering and manufacturing techniques. The modification center's computer-aided design techniques have been employed to determine optimum placement for new aircraft instrumentation and for the addition of a conformal strap to the structural casing of an aircraft bulkhead for stress relief. Computer-aided manufacturing has been used in previously underestimated prototype construction activities, with high productivity ratings resulting from the ease with which design modifications could be inserted into the numerical control code. Attention is given to the radome nose structure modification work undertaken for the EC-18B aircraft. O.C.

**SOLAR POWERED VEHICLE MAY FLY YEAR-LONG MISSIONS**
J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 6, March 1986, p. 54-59.

Attention is given to the performance requirements and projected design features of a solar cell-based propulsion unmanned aircraft type designated the 'high altitude powered platform' (HAPP). During daylight hours, the electrical propulsion system would receive its power directly from solar cell arrays covering the upper surfaces of the aircraft; nocturnal propulsion power is furnished by fuel cells that would have been charged by excess daylight power. HAPP aircraft, which may typically have a 300-ft wingspan, would fly at 65,000 ft for essentially unlimited periods (terminated for the sake of maintenance); their mission would be to carry earth resources sensors and transmit the data they obtain to ground stations. O.C.

**STRENGTH ANALYSIS OF FLIGHT VEHICLES [RASCHET NA PROCHNOST' LETATEL'NYKH APPARATOV]**
A. S. AVDONIN and V. I. FIGUROVSKII Moscow, Izdatel'stvo Mashinostroenie, 1985, 440 p. In Russian. refs

Applied methods of static strength analysis of flight vehicles, including aircraft, rockets, and spacecraft, are presented. In particular, attention is given to the analysis of loads acting on flight vehicles in flight and during landing; the heating of flight vehicle structures; and methods of the strength analysis of wings of various configurations, including finite element analysis in displacements and forces. The discussion also covers the strength analysis of wings and tail units, chassis, engine installations, fuselage, and other structures; minimum-weight design; and fatigue strength analysis. V.L.

The dynamic performance of individual structural components and the whole aircraft was evaluated. The dynamic properties of the aircraft and its components were analyzed. One hundred and thirty-nine locations for transient imputs are chosen using an instrumented hammar and on-line data reduction for modal properties. Results from up to six modes of the natural frequency modal mass ans stiffness and damping tests are presented. The test set-up, choice of locations for excitations, and actual test procedures are outlined. The advantages of sweep-sine, step relation random and transient test methods on aircraft structures are discussed. E.A.K.

An optimization capability for sizing airframe structures that are subjected to a combination of deterministic and random flight loads was established. The random vibration environment introduces the need for selecting a statistical process that best describes the random loads and permits computation of the dynamic response parameters of interest. Furthermore, it requires a formulation of design constraints that would minimize the conservativeness in the design and retain computational viability. The random loads are treated as a stationary, homogeneous process with a Gaussian probability distribution. The formulation of the analysis problem, the structure of the optimization programming system and a representative numerical example are discussed. Author

**STRUCTURAL MATERIALS IN AERONAUTICS: PROSPECTS AND PERSPECTIVES**
G. G. POPE 28 Aug. 1985 45 p refs Presented at European Pioneers Day Meeting, Paris, 25 Apr. 1985
(RAE-TR-85077; BR97329) Avail: NTIS HC A03/MF A01

Developments in materials and their prospects of application in airframes and engines are reviewed. Technical and cost considerations that govern material selection; and the merits of fiber composites, titanium alloys, steels and aluminum alloys for airframe applications are examined. The benefits offered by fiber composites must be assessed for specific applications in relation to developments in aluminum alloys, notably lithium-containing alloys and alloys produced by rapid solidification or condensation. Titanium alloys and steels are expected to fulfil an important but limited role in airframes. In the engine, titanium and nickel-base alloys respectively will satisfy most compressor and turbine requirements, although use of ceramics is expected. It is concluded that new materials are acceptable only if a clear understanding is achieved of the relationship between composition, microstructure and material behavior, the manufacturing route, and quality control of the product. Avail: NTIS HC A02/MF A01

The aerodynamic stability and control characteristics of the forward swept wing aircraft, and likely stability augmentation requirements were studied. It is found that: (1) the theoretical aerodynamic models match the observed aerodynamic performance; (2) the estimated stability derivatives when incorporated in a computer simulation provide response characteristics which agree with experimentally derived responses; (3) the parametric identification technique is effective; (4) theoretical predictions of longitudinal static stability margins indicate that the aircraft is more stable than observed in experiments; (5) feedback control is relatively straightforward; and (6) the experimental system permits dynamic testing on the aircraft model with a longitudinal static stability margin as small as -4%. This procedure is distinguished by two beating wings which together describe, in space, a succession of interlaced triangles. On these wings, whose incidence varies automatically, identical forces are exerted: simultaneous lift and thrust when they make their descent, which is inclined toward the front of the craft, and lift alone when they make their ascent, which is inclined toward the rear of the craft and follows a slide horizontal movement. A mechanical device makes these movements possible. It includes: two wings with hollow profiles, connected by a framework located above a rigid frame and attached to it by bars with joints. These bars are moved with control rods which gear down the drive force. A mechanism with elastic bands or springs automatically varies the incidence of the wings. Author

A ground based aircraft refueling system uses existing air-to-air refueling technology. A fixed facility design attaches a moveable air-to-air type refueling boom and probe to an overhead track mounted on the ceiling of a TAB VEE aircraft shelter. Movement of the boom and probe is controlled from a remote control room protected from hazardous chemical and biological environments. In a second embodiment a moveable facility design mounts on the top of a tank truck a first boom attached at a right angle to an air-to-air type refueling second boom and probe. The booms and probe are remotely controlled from the truck cab which is protected from hostile chemical and biological environments. A third embodiment adds to the moveable facility design a second tank and nozzle outlet for spraying decontaminate.

Calibration of the equipment of three powered sail planes and a jet plane with angle-of-attack and sideslip sensors for measuring the local flow vector is described. The impact of angle-of-attack and sideslip and of other interfering parameters on the measured value was studied. A mathematical simulation of compressible flow at the tip of the probe is followed by experimental wind tunnel investigations, analysis, and application on in-flight measurement. Criteria for flight-test use of the sensors are outlined.

**AVNER ELECTRONIC MAGNETIC COMPASS AND LOW COST NAVIGATION SYSTEM**
A. SOBEL (Elbit Computers, Ltd., Ground Systems Div., Haifa, Israel) IN: Institute of Navigation, Annual Meeting, 41st, Annapolis, MD, June 25-27, 1985, Proceedings . Washington, DC, Institute of Navigation, 1985, p. 22-28.

A new type of Electronic Magnetic Compass has been developed by Elbit Computers Ltd. This compass corrects the deviations in the Magnetic Compass reading, when mounted on iron body vehicles, by using a classic formula implemented by a microprocessor. This compass is so flexible that it can even correct the deviations caused by the iron body of tanks with rotatable turret. The compass is self calibrated by a computer program which relieves the crew from the complexity of the process. It is argued that this compass has the potential of becoming a low-cost solution to the navigational problems of the large mass of military and commercial land vehicles, aircraft, and ships operating on its own and in conjunction with GPS. The concept and the construction of the compass is explained, some experimental results, and the project status are given. Author

**DIGITAL AVIONICS FOR MODERN AIRCRAFT - A CASE STUDY INTO THE PROBLEMS AND PROMISE OF AIRCRAFT ELECTRONICS**
H. S. ARCHER, III (Lockheed-Georgia Co., Marietta) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 144-151.

With decreasing static stability margins and increasingly rigorous mission requirements, the role of aircraft electronics has become vital. A brief historical perspective of the evolution of avionics is given, and the harsh environmental constraints under which current avionics must operate are noted. The case for spatially redundant integrated racks composed of standardized modules is made. A state-of-the-art design approach is then presented, followed by a discussion of an advanced system that will be typical of aircraft in the 1990's. The topics discussed include: designing for thermal management, distributed processing, built-in-test requirements, and redundant systems for flight-critical applications. Author

### HIGH STABILITY PRESSURE TRANSDUCERS FOR AIR DATA SYSTEMS AND TEST SETS

D. W. BUSSE and D. F. PETERSON (Paroscientific, Inc., Redmond, WA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 270-274.

The design and the operational principles of a digital quartz pressure transducer are presented, together with its pressure/frequency relationship equation and an algorithm for temperature compensation. The characteristics of these transducers include a high operating temperature range (from -54 C to +107 C); high shock and vibration resistance of the isolation housing, which can withstand MIL-STD environments; and long term calibration stability, with the drift rates less than 0.089 millibars/year. The low sensitivity to harsh environments and to power supply fluctuation, and the high level digital output make the quartz pressure transducers ideally suited for many flight applications. I.S.

**A86-28363**

### A NOVEL PRIMARY AIR DATA QUALITY PRESSURE TRANSDUCER

P. B. DUPUIS (Honeywell, Inc.; Commercial Aviation Div., Minneapolis, MN) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 275-283. refs

A state-of-the-art pressure transducer is described that senses both pitot and static pressures within a single solid-state sensor. This small, relatively simple, and easily interfaced transducer provides exceptional accuracy and long-term stability over a broad environmental range. The transducer's small size will enable Honeywell to integrate an ARINC 706 equivalent air data computer within an ARINC 704 inertial reference system. Remotely located pressure transducers having ARINC 429 outputs of linearized total pressure (Pt), static pressure (Ps), and impact pressure (Qc) are also made possible by this transducer. Incorporation of this transducer into flight hardware began with the latest HG480 and HG280D80 air data computers, which are standard equipment in Boeing 737-300, Douglas MD-80 and KC-10 series aircraft. This transducer is also being used in an Engine Pressure Ratio (EPR) system for the Fokker F28 MK100 and Gulfstream G-IV aircraft. Author

### WIND TUNNEL CALIBRATION OF A FLOW DIRECTION SENSOR AND A PITOT-STATIC TUBE TO HIGH ANGLES OF ATTACK AND SIDESLIP

F. W. HAGEN and R. V. DELEO (Rosemount, Inc., Eden Prairie, MN) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 284-290.

Modern high performance military aircraft require accurate air data measurements while operating in maneuvering flight at very high angles of attack and angles of sideslip. Inflight calibration of the air data systems is difficult under these flight conditions. Flight test data obtained on an F-14 are believed to be inaccurate and not representative of actual performance. Therefore, the accuracy of air data measurements at high local flow angles has been evaluated in the Rosemount Transonic Wind Tunnel for two types of air data sensors. The sensors are: (1) a hemispherical flow-angularity sensor that measures both angle of attack and angle of sideslip, and (2) an L-shaped fuselage-mounted pitot-static tube. Author

### A MODULAR STRESS MANAGEMENT SYSTEM (MSMS) WITH WORLDWIDE APPLICATIONS

C. J. RADFORD (GEC Avionics, Ltd., Rochester, England) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 317-325.

The paper describes a universal Modular Stores Management System (MSMS) design concept, which features low development costs and timescales, commonality between aircraft types, and VLSI technology, providing high reliability and a common product support and maintenance philosophy. The MSMS was successfully applied to 19 types of aircraft, including E-111, P-3, A-7, and AV-8B, and was shown to be capable of interfacing with at least 11 different weapon systems, including Sea Eagle, JP 233, HARM, and ALARM. In addition, the MSMS can control an extensive range of conventional bombs and mines, nonweapons (such as carriers, launchers, and pods), and particle weapons. The MSMS is MIL-STD-1760A/STANAG 3837AA compatible. I.S.

### ADAPTIVE FIELD OF VIEW EXPANSION VIA MULTIPLE MODEL FILTERING FOR TRACKING DYNAMIC TARGET IMAGES

P. S. MAYBECK and R. I. SUIZU (USAF, Institute of Technology, Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 364-373. refs

Multiple model adaptive estimation is investigated as a means of changing the field-of-view as well as the bandwidth of an infrared image tracker against a wide dynamic range of targets. The multiple models are created by tuning the filters for best performance at differing conditions of exhibited target behavior and differing the physical size of their respective fields of view, and probabilistically weighted averaging provides the adaptation mechanism. Each filter involves online identification of the target shape function, so that this algorithm can be used against ill-defined and/or multiple-hot-spot targets. When each individual filter has the form of an enhanced correlator/linear Kalman filter, computational loading is very low, whereas an extended Kalman filter, processing the raw infrared data directly and assuming a nonlinear constant turn-rate target dynamics model provides superior tracking capability, especially for harsh maneuvers. Author

**A86-28390**

### IMPLEMENTATION OF TF/TA IN THE DIGITAL TERRAIN MANAGEMENT AND DISPLAY SYSTEM

P. WHITEMAN and G. L. MIZE (Harris Corp., Government Aerospace Systems Div., Melbourne, FL) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 531-537. Research supported by General Dynamics Corp.

The configuration of the digital terrain management and display system (DTMDS) is described. The functions of the database, output video, symbol generation, and autonomous navigation processings are analyzed. The algorithms for terrain avoidance (TA) and terrain following (TF) are studied. The development and maintenance of the local terrain elevation database for TA/TF are investigated; the access method for TA/TF to the DTMDS map is examined. Algorithm simulations and processor landing analyses of the TA/TF system are discussed. I.F.

**A86-28463#**

### EMBEDDED TRAINING AVIONICS INTEGRATION

I. V. GOLOVCSENKO and A. J. BALAZS (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1120-1124. refs

Advanced concepts of embedded operational training are examined which future airborne system technology could support. Embedded training involves the shared use of operational and training equipment in an aircraft; it consists of embedding into aircraft systems (particularly the avionics) the capability to conduct airborne training operations including flight against on-board generated 'threats'. The cockpit of the 1990s will very likely be highly dependent of real-time computer generated displays, including heads-up, tactical situation, multisensor, helmet mounted and system status monitor displays. A variety of information, including terrain imagery, moving maps, threats, symbology, and pathways in the sky, will be integrated and presented. The Pave Pillar program is discussed as an example of an approach to a large highly integrated avionics system. Author

**A86-28464**

### ONBOARD SIMULATION - A DEMONSTRATED TECHNOLOGY BREAKTHROUGH FOR COST EFFECTIVE TESTING AND TRAINING

B. J. BRADY (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH), R. G. HUGHES (USAF, Human Resources Laboratory, Williams AFB, AZ), and J. H. CARLSON (McDonnell Aircraft Co., St. Louis, MO) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1126-1131. refs

The aircrew training aspects of the Onboard Simulation system are examined. The baseline Onboard Simulation system was developed as part of the Air Force Integrated Flight/Fire Control (IFFC) program, as described by Lambert (1982). Training currently consists of a mix of academics, training devices including operational simulators, and flight training on local ranges and instrumented test ranges which provide for electronic warfare and composite force training. The use of Onboard Simulation, augmenting conventional simulation and range capabilities, will significantly increase pilot effectiveness and decrease future test and evaluation and training costs. D.H.

**A86-28465#**

### DESIGN CONSIDERATIONS FOR ON-BOARD SIMULATION

D. R. BREGLIA (U.S. Navy, Naval Training Equipment Center, Orlando, FL) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1132-1137. refs

Design implications of embedded training for the F/A-18 aircraft (a multi-role, high performance, single-seat tactical aircraft) are discussed. The primary mission areas are: anti-air warfare; anti-surface warfare; strike arfare; amphibious warfare; mine warfare; mobility; and command, control, and communication. The current F/A-18 training syllabus is reviewed and those training events which can be supplemented and enhanced through the use of on-board simulation are identified. Five design approaches for embedded training systems are related to the training events. D.H.

**A86-28478**

### ULTRASONIC LIQUID QUANTITY MEASUREMENT

E. T. RUTLEDGE (Lockheed-Geogia Co., Marietta, GA) IN: NEACON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1236-1242.

Mechanical and electrical techniques are examined for measuring liquid quantitiess, by using ultrasonic generators as a signal source. Existing techniques for measuring liquid quantities in aircraft use transducers which ae not only inaccurate and unreliable but which are frequently difficult to maintain. The techniques proposed for using ultrasonic transducers improve on all of the areas of deficiency and obviate the need for aircraft power in the fuel cells or other liquid containers. As a specific application of the technology, measurement of the engine oil quantity for the Lockheed-Georgia C-130 aircraft is considered. D.H.

### ELECTRONIC DISPLAY LUMINANCE AND GREY SCALE CONTROL

K. T. BURNETTE (Burnette Engineering, Fairborn, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1500-1510. refs
(Contract F33615-81-C-3620; F33615-84-C-3627)

The role that luminance plays in making information depicted on military aircraft video displays both perceptible and interpretable by a pilot is explored. Particular design criteria issues are investigated that involve electronic display luminance and grey scale control: display luminance uniformity, sensor/video system signal transfer characteristics, display picture grey shade content, and the effects of cockpit illumination and glare source viewing conditions. D.H.

### APPLICATION OF MAGNETO-OPTIC MODULATORS TO ADVANCED AVIONIC DISPLAYS

A. J. MOFFAT, A. QUAGLIA, and R. C. BAJCAR (Litton Systems Canada, Ltd., Rexdale, Canada) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1511-1518. refs

The magnetooptic light modulator (based on the Faraday effect) is examined as a means of significantly improving avionics displays for future aircraft. The light modulator has application to high brightness raster-scan projector systems suitable for use in head-up displays, head-down displays, and helmet mounted displays. The basic principles of the device and its characteristics are explained. D.H.

### A CONSTANT ALTITUDE FLIGHT SURVEY METHOD FOR MAPPING ATMOSPHERIC AMBIENT PRESSURES AND SYSTEMATIC RADAR ERRORS

T. J. LARSON and L. J. EHERNBERGER (NASA, Flight Research Center, Edwards, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1519-1526. Previously announced in STAR as N85-29951. refs

The flight test technique described uses controlled survey runs to determine horizontal atmospheric pressure variations and systematic altitude errors that result from space positioning measurements. The survey data can be used not only for improved air data calibrations, but also for studies of atmospheric structure and space positioning accuracy performance. The examples presented cover a wide range of radar tracking conditions for both subsonic and supersonic flight to an altitude of 42,000 ft. Author

**REAL-TIME CIRCLE GENERATION FOR RASTER DISPLAYS**
R. J. CARUSO (BDM Corp., Dayton, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1549-1555. refs

A new method of drawing circles in real time for aircraft displays is presented. If a fixed-size circle needs to be drawn over and over in a real-time display, most circle algorithms spend a significant amount of time recomputing a fixed set of relative points. The new method employs a circle primitive with run-time efficiency; it computes the points needed for an octant of the circle just once, then stores them in reduced form, and uses them as a template for the rest of the circle and for subsequent drawings of the same circle. The problem is analyzed and the algorithm is given. D.H.

**PILOT/VEHICLE INTERFACE DESIGN SYSTEM (PIVIDS)**
R. D. MOORE and C. A. MOORE (Verac, Inc., San Diego, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1556-1563.

A concept for a rapid prototyping simulator for the cockpit display problem has been developed. Called the Pilot Vehicle Interface Design System, or PIVIDS, the system is a response to the problem of evaluating the pilot/vehicle interface with regard to complex, new multifunction displays. The F-16C/D cockpit, which has ten computers (communicating with each other over three multiplex buses) and a variety of display units, is considered as an example where PIVIDS can greatly aid the designer. The system is suited to a broad range of other applications. D.H.

**THE CREW STATION INFORMATION MANAGER - AN AVIONICS EXPERT SYSTEM**
L. D. POHLMANN (Boeing Military Airplane Co., Wichita, KS), P. S. MARKS, and M. R. FEHLING (Advanced Information and Decision Systems, Mountain View, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1576-1582. refs
(Contract F33615-83-C-1083)

Progress to date is reported on the development of CSIM, the Crew Station Information Manager, which is a prototype avionics expert system being designed and developed under contract to the Air Force Avionics Laboratory. The function of CSIM is to manage the interface between the pilot and the avionics suite of a future tactical aircraft. A review is given of program motivation and objectives, and a set of avionics expert system candidates is identified. Preliminary development and early simulation are discussed, and near-term plans are outlined in connection with a contract extension sponsored by DARPA. D.H.

**A86-28516**
**EXPERT SYSTEM PILOT AID**
J. R. JURGENSEN and R. E. FELDMANN (Systran Corp., Dayton, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1583-1590.

A status report is given for the Expert System Pilot Aid (ESPA) small-business contract with Air Force Avionics Laboratory to study the application of expert system programming techniques to the advanced fighter cockpit. Topics covered include: heuristics vs deterministics; expert system language selection (a modified OPS-5 language is chosen); and mission analysis (emergency scenarios: landing gear failures, engine failure at altitude, system failure during takeoff). A simulation evaluation of ESPA is to be made using the Avionic System Analysis and Integration Laboratory (AVSAIL) facility at Wright Patterson Air Force Base. D.H.

**LANTIRN FLIGHT TEST - OPENING THE NIGHT WINDOW**
G. W. MATTHES (USAF, Flight Test Center, Edwards AFB, CA) Cockpit (ISSN 0742-1508), Oct.-Dec. 1985, p. 5-20.

The development and testing aspects of the Low Altitude Navigation and Targeting Infrared System for Night (LANTIRN) are discussed. The features and the capabilities of the three LANTIRN subsystems a Wide Angle Raster HUD, a navigation pod, and a targeting pod, are presented together with some testing results. Special attention is given to the testing of the LANTIRN's Navigation Pod and its components, the Environmental Control Unit, the Terrain Following Radar (TFR), and the infrared Fixed Imaging Navigation Sensor (FINS). The system integration testing of the Navigation Pod has shown that the combined effect of the easy to fly TFR guidance and the anticipation cues given by the FINS video make the operations of the night low level flying and weapon delivery, and the exercise of tactically sound egress techniques comparable with the same operations performed in the day low level flying. **ASYMMETRIC THRUST WARNING SYSTEM FOR DUAL ENGINE AIRCRAFT Patent**
W. W. STOCKTON, inventor (to Air Force) 8 Oct. 1985 4 p
Supersedes AD-D010978
(AD-D011960; US-PATENT-4,546,353;
US-PATENT-APPL-SN-577412; US-PATENT-CLASS-340-966)
Avail: US Patent and Trademark Office CSCL 01D

An asymmetric thrust warning system for an aircraft having two gas turbine engines. The compressor discharge pressures of the two engines are compared to determine the engine providing the lower thrust and to provide a signal indicative of the actual difference in thrust. If the difference in thrust exceeds a prescribed value related to aircraft altitude, a low thrust warning lamp is illuminated. In addition, the positions of the two augmenter metering valves are compared. If their positions significantly differ, the warning light associated with the valve having the minimum opening will be illuminated. A stall warning circuit may also be included as a part of the system. GRA

This research effort reflects the perceptions and attitudes about avionics standardization by some members of the acquisition community. All of the interviewees were knowledgeable on the subject of and many had extensive experience with, avionics standardization. They either were currently working or had previously worked with avionics standardization. The analysis reflects some of the attitudes about the policies and procedures of avionics standardization and the role of the Deputy for Avionics Control in the process of standardization. The analysis also includes recommended changes to the current process of standardizing avionics equipment. The result of the research effort shows that the acquisition community has not accepted avionics standardization for a number of reasons. GRA

A description of two recent GEC Avionics (GAv) systems is included: (1) A310 Slats and Flaps Control System; and (2) Jaguar FBW Demonstrator Flight Control System. Particular reference is made to the architecture of the computers and embedded software. Data is included on the two different system design requirements, especially those relating to integrity and availability. Emphasis is placed on the reasons for selecting dissimilarity, as an implementation philosophy, for the A310 system, as against the multiple similar Jaguar demonstrator architecture. The paper then provides a brief description of the design and development program for the two computer units with emphasis on lessons learned, specially in the software areas. The aspects of the system and computer design involved with maintainability and reliability are detailed and current in-service experience discussed where applicable. Conclusions are drawn particularly on dissimilarity, highlighting lessons learned from these successful FBW programs. A potential method of providing software fault tolerance within a dissimilar implementation is discussed and preliminary results of a GEC research program in this area provided. Author

Avail: NTIS HC A07/MF A01

This paper outlines the major constraints imposed on the design of dependable local area networks for avionic systems and underlines the essential differences in requirements that exist with respect to those of ground-based (civil) LANs. The different choices available to the system designer are then discussed: technology (electrical or optical), architecture (bus or loop), general philosophy (centralized or decentralized), medium access control (competition or consultation). The paper then goes on to summarize two different and independent avionic LAN research projects; one which focusses on fault and damage-tolerance and the other on high-speed. Author

**DESIGN ISSUES IN DATA SYNCHRONOUS SYSTEMS**
G. M. PAPADOPOULOS *In* AGARD Fault Tolerant Hardware/Software Architecture 12 p Sep. 1985 refs
Avail: NTIS HC A07/MF A01

Fault tolerant data synchronous systems are ones where the outputs of all correctly operating redundant channels are guaranteed to bit-for-bit agree, independent of whether the channels are clock, instruction or frame synchronous. Data synchronous systems offer a form of fault tolerant processing capable of correctly supporting a very general class of programs. In fact, the redundancy becomes relatively transparent to the programmer of applications for data synchronous systems, making them ideally suited for complex, algorithmically intensive programs that would be otherwise impossible to support. The various aspects of the design of correct data synchronous systems are examined in detail. These include: Source consistency, the requirement that all correctly operating channels receive precisely the same inputs, Event synchronization, the problem of keeping the time skew between channels within predetermined bounds, as well system initialization. The unsolved problem of latent faults is also presented along with the need for self-test heuristics. Sequential fault tolerant and parallel fault tolerant approaches are contrasted for systems requiring protection from multiple faults. Both hardware and software solutions to these problems are given, emphasizing system performance and economy. The paper concludes with the application of these techniques to the design of triplex fail-operational and quadruplex and dual-dual fail-operational-fail-operational systems. Author

**DIGITAL FAULT-TOLERANT FLIGHT ACTUATION SYSTEMS**
H. H. BELMONT *In* AGARD Fault Tolerant Hardware/Software Architecture 19 p Sep. 1985
(Contract F33615-80-C-3623)
(AFWAL-83-3041) Avail: NTIS HC A07/MF A01

A study was made of the equipments making up a typical flight control actuation system (servo electronics, servo valves, actuators and transducers) to determine where digital technology could replace analog technology for the purpose of providing a more fault-tolerant flight control actuation system. The investigation involved an analysis of where digital-to-analog conversion should take place between the light control computer and the analog control surface, and led to an evaluation of several architectural design issues. Among these were how to functionally partition the system, where to locate the servo electronics, the adequacy of military standard serial bus systems for control (versus data) applications, and the feasibility of providing electronics which could survive severe environments. Several actuation system configurations were evaluated. This led to recommending, as the best development prospect, a locally integrated actuation system consisting of servo electronics, servo valves, actuators, and transducers, interfacing with a digital flight control computer over a serial bus. **DESIGN VALIDATION OF FLY-BY-WIRE FLIGHT CONTROL SYSTEMS**
G. L. HARTMANN, J. E. WALL, JR., and E. R. RANG *In* AGARD Fault Tolerant Hardware/Software Architecture 17 p Sep. 1985 refs
Avail: NTIS HC A07/MF A01

This paper addresses the problem of design validation of fault tolerant architectures. Finite-state machines are used to formally specify flight control functions. Their application is not new to engineering practice in flight control. However, it is believed that their systematic and formal use to form the structure of the system specification will be an aid in the design phase and in the validation phase. Examples are used to illustrate their application to flight control specifications. The second portion of this paper is concerned with the problem of testing highly reliable systems. Models based on fault-trees in the early definition phase of estimating reliability are used to design tests to be performed at the iron bird state (hardware in-the-loop). Confidence in the overall system reliability is derived from a combination of component life-tests and a careful evaluation of the faults that the system is designed to accommodate without loss of control. **MINIMUM OPERATIONAL PERFORMANCE STANDARDS FOR AIRBORNE DISTANCE MEASURING EQUIPMENT (DME) OPERATION WITHIN THE RADIO FREQUENCY RANGE OF 960-1215 MEGAHERTZ**
20 Sep. 1985 195 p refs
(RTCA/DO-189; SC-149) Avail: NTIS HC A09/MF A01

Minimal operational performance standards for airborne distance measuring equipment (DME) operating within the radio frequency range of 960 to 1215 MHz are contained. Information needed to understand the rationale for equipment characteristics and requirements is stated along with the minimum performance standards for the equipment. These standards define required performance under standard operating conditions and stressed physical environmental conditions. The operational performance characteristics are described for equipment installations and conditions and tests that will assure the user that the equipment will perform safely and reliably in the expected operational environment are defined. A configuration of airborne equipment encompassing an antenna system, transmission lines, DME interrogator, interrogator control unit and interfaces with aircraft displays/systems are considered. ### WILL 1990S AIRCRAFT BE POWERED BY PROPFAN OR ADVANCED TURBOFAN?

D. J. HOLT Aerospace Engineering (ISSN 0736-2536), vol. 6, Feb. 1986, p. 8-12.

The evolution of the engine for a next generation aircraft is discussed, with a look at the Rolls Royce designs for the two principal possibilities, the propfan and the advanced turbofan. Fuel efficiency is the driving factor for the designs, with the propfan offering a 35 percent savings, and the 4th generation turbofan presenting the possibility of a 25 percent savings as compared to modern aircraft. The pusher propfan design uses the swept propeller, contra rotating propellers, and a geared propeller drive to balance propulsive efficiency and cruise speed against noise considerations. Additional 'building block' modifications, including a new exhaust port which exits after the blade, provide additional power and reduce the length down to 17 feet. In the turbofan, placing the fan behind the core engine to remove the low pressure shaft, and the use of a contra rotating fan driven by a contra rotating turbine, allows for a smaller diameter core, a low hub/tip ratio, a high rpm core, and a corresponding reduction in specific fuel consumption. It is concluded that choice of engine designs will be dictated by the future marketplace. R.R.

**A86-26371**

### PROPFAN ENGINE DESIGNS EXAMINED

J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 6, Feb. 1986, p. 17-22.

Considerations in the design of the fuel efficient medium-sized aircraft propfan engine, and various on-going developmental efforts are reviewed. Developed because of the propeller's historical 80 percent propulsive efficiency, the propfan utilizes more blades of shorter diameter that are thinner in section and larger in chord than conventional propellers. Limited tip speeds and rear mounting design minimize cabin noise. A rear-mounted counter-rotating propeller arrangement converts swirl energy into usable thrust and is 10 percent more efficient than a single-rotating configuration. The GE unducted fan (UDF) illustrates the less complex, shorter engine that results from the direct-drive approach. Gearing allows optimization of the turbine and propeller rotation rates (increasing their efficiency), and the flexibility of configuration for front and rear mounting. In the UDF, blade speed control and pitch change will be digitally controlled to optimize propulsion efficiency in all flight regimes. The ducted propfan, though two-thirds as efficient as an equivalent propfan, is projected to be more efficient than even an advanced turbofan and has application to larger, long-range airline aircraft. R.R.

### NONLINEAR ANALYSIS OF PRESSURE OSCILLATIONS IN RAMJET ENGINES

V. YANG (Pennsylvania State University, University Park) and F. E. C. CULICK (California Institute of Technology, Pasadena) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 13 p. Research supported by Pennsylvania State University. refs
(Contract N00014-84-K-0434)
(AIAA PAPER 86-0001)

Pressure oscillations in ramjet engines have been studied using an approximate method which treats the flow fields in the inlet and the combustor separately. The acoustic fields in the combustor are expressed as syntheses of coupled nonlinear oscillators coresponding to the acoustic modes of the chamber. The influences of the inlet flow appear in the admittance function at the inlet/combustor interface, providing the necessary boundary conditions for calculation of the combustor flow. A general framework dealing with nonlinear multi-degree-of-freedom systems has also been constructed to study the time evolution of each mode. The results obtained serve as a basis for investigating the existence and stabilities of limit cycles for acoustic modes. As a specific example, the analysis is applied to a problem of nonlinear transverse oscillations in cylindrical combustors. Author

### FORCED RESPONSE ANALYSIS OF AN AERODYNAMICALLY DETUNED SUPERSONIC TURBOMACHINE ROTOR

D. HOYNIAK (NASA, Lewis Research Center, Cleveland, OH) and S. FLEETER (Purdue University, West Lafayette, IN) IN: Vibrations of blades and bladed disk assemblies; Proceedings of the Tenth Biennial Conference on Mechanical Vibration and Noise, Cincinnati, OH, September 10-13, 1985 . New York, American Society of Mechanical Engineers, 1985, p. 1-13. NASA-supported research. refs

The effect of aerodynamic detuning on the supersonic flow induced forced response behavior of a turbomachine blade row is analyzed using an aeroelastic model. The rotor is modeled as a flat plate airfoil cascade representing an unwrapped rotor annulus; the aerodynamic detuning is achieved by alternating the circumferential spacing of adjacent rotor blades. The total unsteady aerodynamic loading on the blading, due to the convection of the transverse gust past the airfoil cascade as well as that resulting from the motion of the cascade, is developed in terms of influence coefficients. The model developed here is then used to analyze the effect of aerodynamic detuning on the flow induced forced response behavior of a twelve-bladed rotor with Verdon's Cascade B flow geometry. V.L.

### THE EFFECT OF LIMITING AERODYNAMIC AND STRUCTURAL COUPLING IN MODELS OF MISTUNED BLADED DISK VIBRATION

P. BASU and J. H. GRIFFIN (Carnegie-Mellon University, Pittsburgh, PA) IN: Vibrations of blades and bladed disk assemblies; Proceedings of the Tenth Biennial Conference on Mechanical Vibration and Noise, Cincinnati, OH, September 10-13, 1985 . New York, American Society of Mechanical Engineers, 1985, p. 31-40. refs
(Contract NAG3-367)

A model has been developed for studying the effect of mistuning on bladed disk vibration which has the unique feature that the extent of aerodynamic and structural interaction which it simulates can be readily varied from full coupling of all blades on the disk to coupling of each blade with only its nearest neighbors. Simulations utilizing the resulting algorithm show that limited coupling models may be used to predict the statistical distribution of blade amplitudes that characterizes the mistuning effect, which in turn determines stage durability. This approach is used to study the effect of changing various system parameters on amplitude scatter. Gas density, the number of blades on the disk, disk stiffness, and the engine order of the excitation are considered. The results are used to draw some conclusions about how to improve laboratory tests and component design. Author

**AIRCRAFT ELECTRICAL POWER SYSTEMS**

E. D. BEAUCHAMP (AiResearch Manufacturing Co., Torrance, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1527-1535. refs

The potential is examined for powering future aircraft environmental control systems (ECSs) by means of electric drives rather than by main-engine bleed air (which may not be as available in the next generation of engines). Several aspects of electric systems of permanent magnet, brushless induction machines and solid-state power electronics - to provide primary generation or secondary control of electric drives on aircraft - are discussed. For power distribution, conventional 120/208-V, 3-phase, 400-Hz, 270-Vdc, variable frequency/constant voltage, and variable frequency/variable voltage systems are the primary candidates. Specific examples on 270-Vdc power generation, variable speed drives for an ECS compressor and fan motors, and a variable speed drive for an engine fuel pump system are included. D.H.

An energy recovery system is provided for an aircraft gas turbine engine of the type in which some of the pneumatic energy developed by the engine is made available to support systems such as an environmental control system. In one such energy recovery system, some of the pneumatic energy made available to but not utilized by the support system is utilized to heat the engine fuel immediately prior to the consumption of the fuel by the engine. Some of the recovered energy may also be utilized to heat the fuel in the fuel tanks. Provision is made for multiengine applications wherein energy recovered from one engine may be utilized by another one of the engines or systems associated therewith.

B. H. COX Sep. 1985 106 p
(AD-A161683; AFIT/GSM/LSY/85S-8) Avail: NTIS HC A06/MF A01 CSCL 14A

This investigation derived a jet engine Cost Estimating Relationship (CER) model from multivariate linear regression techniques. Prior to the model's development, all known jet engine cost data bases were examined for applicability to the thesis effort. After identifying constraints and limitations in the data, stepwise regression equations for analysis. The best equation was identified base on pre-established logic and statistical criteria. The equation selected had the following performance, physical, and usage variables: Turbine Inlet Temperature, Specific Fuel Consumption, Weight, and Annual Engine Flying Hours. Results of the model development can be used in comparative cost analyses of present and proposed weapon systems; in cost trade-off studies to determine impact of design alternatives for new engineers; in reports to Congress on the costs of operating engines; and in estimating budget requirements. D. O. NASH, inventor (to Air Force) 1 Oct. 1985 19 p
(AD-D011998; US-PATENT-APPL-SN-782332) Avail: NTIS HC A02/MF A01 CSCL 21E

This patent application discloses an exhaust nozzle flap capable of resisting high exhaust temperatures of turbojet engines. The flap is composed of a two-part structure of high strength metal, in a support member, combined with a heat resistant base member made from a ceramic or carbon-carbon material. The different materials in the base and support members, having substantially different rates of thermal expansion, are not bolted or riveted together, but attached in a unique manner to allow relative movement therebetween. **LOW-SPEED STABILITY CHARACTERISTICS OF A HELICOPTER WITH A SLING LOAD**

B. L. NAGABHUSHAN (Goodyear Aerospace Corp., Akron, OH) Vertica (ISSN 0360-5450), vol. 9, no. 4, 1985, p. 345-361. refs

The low-speed stability characteristics of a conventional helicopter with an external sling load on a single-point suspension are investigated using an 18th order dynamic model of the two-body system. Nonlinear equations of motion are derived which describe the six degrees of freedom rigid body motion of the helicopter, including its rotor dynamics, coupled with the longitudinal and lateral dynamics of the sling load. Significant differences, including instability and cross-coupling in the associated pendulous motion of the sling load and the inherent oscillatory motions of the helicopter, are found between operation with a short and long sling cable. Operation with a long sling cable damps out the sling-load lateral oscillation and the helicopter longitudinal phugoid, but the associated sling-load pitch oscillation and helicopter Dutch roll mode become unstable. Suspending the sling load from a point ahead of the center of gravity stabilizes the helicopter lateral oscillation, while suspending it from a point aft of the c.g. causes instability in that mode. **AN EXPERIMENTAL STUDY OF THE LIFT, DRAG AND STATIC LONGITUDINAL STABILITY FOR A THREE LIFTING SURFACE CONFIGURATION**

C. OSTOWARI and D. NAIK (Texas A&M University, College Station) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 13 p. refs

(Contract NAG1-344)

(AIAA PAPER 86-0398)

The experimental procedure and aerodynamic force and moment measurements for wind tunnel testing of the three lifting surface configuration (TLC) are described. The influence of nonelliptical lift distributions on lift, drag, and static longitudinal stability are examined; graphs of the lift coefficient versus angle of attack, the pitching moment coefficient, drag coefficient, and lift to drag ratio versus lift coefficient are provided. The TLC data are compared with the conventional tail-aft configuration and the canard-wing configuration; it is concluded that the TLC has better lift and high-lift drag characteristics, lift to drag ratio, and zero-lift moments than the other two configurations. The effects of variations in forward and tail wind incidence angles, gap, stagger, and forward wind span on the drag, lift, longitudinal stability, and zero-lift moments of the configuration are studied. I.F.

**REALTIME PILOTED SIMULATION INVESTIGATION OF HELICOPTER FLYING QUALITIES DURING APPROACH AND LANDING ON NONAVIATION SHIPS**

W. F. JEWELL, W. F. CLEMENT (Systems Technology, Inc., Mountain View, CA), and J. B. JOHNS (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs

(Contract N62269-82-C-0728)

(AIAA PAPER 86-0490)

The Naval Air Development Center (NADC) is revising the Helicopter Flying and Ground Handling Qualities Specification, MIL-H-8501A. As a part of this effort, an investigation is conducted of aspects of helicopter flight dynamics which are unique to Navy operational requirements. Clement and Jewell (1985) have discussed a piloted simulation study of helicopter shipboard landing which had been conducted in connection with this investigation. This paper is essentially a condensation of this discussion. Attention is given to a helicopter mathematical model, the Vertical Motion Simulator (VMS), the environmental conditions, and the simulation protocol. The technical approach is considered along with baseline flying quality ratings, the effect of sea state, the flying qualities rating boundaries, lateral control problems, and visual cues and texture. G.R.

**MATHEMATICAL MODELS FOR STUDYING AIRCRAFT VIBRATIONS WITH ALLOWANCE FOR STRUCTURAL HYSTERESIS [MATEMATICHESKIE MODELI DLIA ISSLEDOVANIIA KOLEBANII SAMOLETA S UCHETOM KONSTRUKTSIONNOGO GISTEREZISA]**

A. N. KOBTSEV IN: Energy dissipation connected with vibrations of mechanical systems . Kiev, Izdatel'stvo Naukova Dumka, 1985, p. 83-90. In Russian.

Mathematical models are presented which have been developed for the analysis of the dynamic loading of nonlinearly elastic aircraft during their arbitrary spatial motion. The models proposed here reproduce the nonlinear properties of the chassis and the internal damping of the aircraft structure. Some modeling results are presented, with particular attention given to the effect of hysteresis and damping parameters on the dynamic loading and fatigue damage of the airframes of several kinds of commercial aircraft. V.L.

**MATRIX EQUATIONS OF THE SPATIAL FLIGHT OF AN ASYMMETRICAL RIGID BODY [MATRICHNYE URAVNENIIA PROSTRANSTVENNOGO POLETA ASIMMETRICHNOGO TVERDOGO TELA]**

V. V. KRAVETS (Dnepropetrovskii Institut Inzhenerov Zheleznodorozhnogo Transporta, Dnepropetrovsk, Ukrainian SSR) Prikladnaia Mekhanika (ISSN 0032-8243), vol. 22, Jan. 1986, p. 105-110. In Russian. refs

Matrix equations describing the dynamics of the spatial flight of an asymmetrical rigid body are proposed whose variables include quasi-velocities and the Rodrigues-Hamilton parameters. The dynamic equations and other auxiliary relationships are expressed in terms of unified matrices, which makes the equations well-organized, compact, and convenient in programming, providing for more efficient use of computers. ### EFFECTS OF SIDE-STICK CONTROLLERS ON ROTORCRAFT HANDLING QUALITIES FOR TERRAIN FLIGHT

E. W. AIKEN (NASA, Ames Research Center, U.S. Army, Aeromechanics Laboratory, Moffett Field, CA) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 11 p. Previously announced in STAR as N85-25267. refs

Pertinent fixed and rotary-wing feasibility studies and handling-qualities research programs are reviewed and the effects of certain controller characteristics on handling qualities for specific rotorcraft flight tasks are summarized. The effects of the controller force-deflection relationship and the number of controlled axes that are integrated in a single controller are examined. Simulation studies were conducted which provide a significant part of the available handling qualities data. The studies demonstrate the feasibility of using a single, properly designed, limited-displacement, multiaxis controller for certain relatively routine flight tasks in a two-crew rotorcraft with nominal levels of stability and control augmentation with a high degree of reliability are incorporated, separated three or two-axis controller configurations are required for acceptable handling qualities. Author

### THE DEVELOPMENT OF MICROCOMPUTER CODES FOR STUDYING THE FLIGHT DYNAMICS AND PERFORMANCE OF HELICOPTERS

B. W. MCCORMICK (Pennsylvania State University, University Park) and R. P. HENNIS (U.S. Navy, Naval Surface Weapons Laboratory, Dahlgren, VA) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 11 p.

A sequence of computer codes for predicting the dynamic behavior of a single rotor/tail rotor helicopter is described. Four basic codes are described, each of which can be run on current minicomputers. A static trim program calculates the control angles and the helicopter angle of attack, and a dynamic program numerically integrates the Euler equations of motion to fly a prescribed maneuver. A third program determines stability derivatives which are then used in the fourth program to analyze the helicopter stability. The latter program generates root loci as a function of stabilizing and control feedback gains. The programs include possible contributions from a stub wing and a horizontal tail with an angle of incidence which can be linked to the longitudinal cyclic pitch. Reasonable agreement is found between predicted results and flight tests simulating the launching of a ballistic rocket. C.D.

**A86-27662#**

### DYNAMIC STABILITY OF HINGELESS AND BEARINGLESS ROTORS IN FORWARD FLIGHT

I. CHOPRA (Maryland, University, College Park) and B. PANDA IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 16 p. refs (Contract DAAG29-83-K-0002)

The successful application of the finite element method based on Hamilton's principle to determine the response and dynamic stability of hingeless and bearingless rotor blades in forward flight is reported. Four beam elements were sufficient to obtain satisfactory response and stability solutions for a hingeless rotor blade, while six elements were needed for a bearingless rotor blade. For response normal mode equations, six rotating modes were adequate for both hingeless and bearingless blades. The vibratory amplitude and mean level of response depend on the advance ratio and the blade structural stiffness. Stability results are obtained for both soft-inplane and stiff-inplane rotors using elastic blade modeling. The effect of dynamic inflow on blade stability in hingeless and bearingless rotors is discussed. C.D.

### KINEMATIC OBSERVERS FOR ROTOR CONTROL

R. M. MCKILLIP, JR. (Princeton University, NJ) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 10 p. refs

A simple scheme for estimating the state variables of a helicopter rotor is presented. The method incorporates the use of blade-mounted accelerometers and position transducers to reconstruct modal displacements and velocities. The design of the observer structure and feedback gains is simplified by the fact that the method requires only knowledge of simple kinematic relationships between the various modal quantities. This observer structure is particularly well-suited to control problems where the use of a traditional Kalman Filter would be too complex or costly. The technique can be viewed as decreasing the requirements on observer complexity while increasing the need for an enhanced sensor complement. Author

### QUANTITATIVE FEEDBACK DESIGN APPROACH TO PILOT-IN-THE-LOOP ANALYSIS

P. WEI (Lockheed-Georgia Co., Marietta, GA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 416-423.

The quantitative feedback technique of Horowitz et al. (1980) is applied, in conjunction with the Neal-Smith criterion, to the pilot-in-the-loop flight control system design. The uncertain control plants are developed by varying the pilot model parameters and pilot compensation work, and the boundaries of the system performance requirements are specified on the basis of the Neal-Smith criterion. As an example, a shaping filter is designed to improve the flying qualities from a possible Level 3 to a definite Level 1. I.S.

### DISCRETE MANEUVER FLYING QUALITIES CONSIDERATIONS IN CONTROL SYSTEM DESIGN

E. D. ONSTOTT and J. S. WARNER (Northrop Corp., Aircraft Div., Hawthorne, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 424-430. Research supported by Northrop Independent Research and Development Program. refs

An analysis of published NT-33 flight test data, a ground-based flight simulation, and time domain pilot/aircraft modeling techniques have shown that the criteria used in the established models may not be sufficiently responsive to the full range of piloted control activity. Large-amplitude, abrupt attitude changes must be specifically considered. An analytical method has been developed using parameters that describe discrete pilot activities. As an example, an actuator rate saturation problem is analyzed. I.S.

**A86-28379**

### DEVELOPMENT OF HARDWARE FOR X-29A FLIGHT CONTROL SYSTEM

J. DANNENHOFFER (Grumman Aerospace Corp., Bethpage, NY) and J. LINDAHL (Honeywell Inc., St. Louis Park, MN) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 440-445. refs

The forward swept wing X-29 aircraft's sensor computer subsystem hardware maintains the lowest possible system costs through the use of off-the-shelf components. A triplex digital system together with triplex analog backup are used to satisfy fail-safe requirements, using extensive self-test and input/output comparisons to satisfy the requirements for a flight safety-oriented system. Attention is presently given to the methods by means of which system requirements were converted into the triplexed hardware, as well as to flightworthiness test results. O.C.

**MULTIVARIABLE CONTROL LAW DESIGN FOR THE AFTI/F-16 WITH A FAILED CONTROL SURFACE**

R. A. ESLINGER (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) and J. J. DAZZO (USAF, Institute of Technology, Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 453-459. refs

The utilization of Porter's multivariable design technique (1981) to develop self-repairing flight control laws that allow the aircraft to maintain stability following a control surface failure is discussed. Linear state space models are created for a healthy F-16 aircraft and an F-16 with a free-floating right horizontal tail. The application of the Porter technique and the state equations to the model designs is described. The checking for transmission and decoupling zeros in the system with the computer program ZERO and the formation of control design laws with the program MULTI are examined. The responses of the models to longitudinal maneuvers (g-command, pitch pointing, and longitudinal translation) and lateral maneuvers (roll, sideforce, yaw pointing, and lateral translation) are evaluated. It is observed that the longitudinal and lateral maneuvers in the control surface failed aircraft are maintained with the control design laws applied to the models. It is concluded that the Porter method is useful in designing aircraft flight control systems which retain stability after control surface failure. I.F.

**AN INTEGRATED FLIGHT CONTROL SYSTEM FOR A STOL TRANSPORT AIRCRAFT**

P. BRIGGS, L. GARDNER (Sperry Corp., New York), and T. G. WOOD (Lockheed-Georgia Co., Marietta) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 482-489. refs

The development of a flight control system (FCS) for short takeoff and landing (STOL) aircraft using the High Technology Test Bed is studied. The main requirements for the future FCS are: (1) autonomous STOL capability, (2) automatic flight path control, (3) control reconfiguration, and (4) a ground-based maintenance diagnostics system; advances in these areas are discussed. The control of the spoilers and tail surface by the DFCS utilizing fail-operational roll stability and control augmentation, direct lift control, fail-operational yaw and pitch stability and control augmentation, and five dual electromechanical actuation systems is described. The input signal management, actuator signal management, synchronization, error handling, power-up reset and recovery, and the built-in test capabilities of the redundancy management of the DFCS are examined. The functional organization of the DFCS is explained. I.F.

**A86-28386**

**VARIABLE CONTROL POLICIES FOR FUTURE AEROSPACE VEHICLES**

F. R. GILL and K. W. ROSENBERG (GEC Avionics, Ltd., Rochester, England) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 500-506. refs

There exists a class of variable control policies with which all dynamic properties of a system are improved compared with the best achievable with conventional linear control. Examples of variable feedback and feedforward controllers are discussed and a new failure testing hypothesis is introduced. Author

**A86-28387**

**DESIGN OF DIRECT DIGITAL FLIGHT-MODE CONTROL SYSTEMS FOR HIGH-PERFORMANCE AIRCRAFT USING STEP-RESPONSE MATRICES**

B. PORTER (Salford, University, England) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 507-513. refs

(Contract SERC-GR/C/77653)

In this paper, fast-sampling error-actuated direct digital flight-mode control systems are designed for the F-16 aircraft using only the appropriate step-response matrix of the compensated open-loop aircraft instead of the first Markov parameter. It is shown that the resulting digital controllers exhibit set-point tracking characteristics which compare favorably with those of direct digital flight-mode controllers previously designed using a mathematical model of the aircraft in state-space form. Since step-response matrices can be readily determined from direct input-output measurements in the time domain, a basis is thus provided for the synthesis of adaptive self-repairing digital flight control systems operating in real time. Author

**A86-28392**

**DETECTION AND ISOLATION OF CONTROL SURFACE EFFECTIVENESS FAILURES IN HIGH PERFORMANCE AIRCRAFT**

J. L. WEISS, A. S. WILLSKY, D. P. LOOZE, J. T. CRAWFORD (ALPHATECH, Inc., Burlington, MA), and R. R. HUBER (General Electric Co., Aircraft Control Systems Dept., Binghamton, NY) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 552-559. refs

This paper presents the design of a failure detection and identification (FDI) algorithm for flight control system failures. This algorithm, which is a key component in an overall fault-tolerant control strategy, is based on analytic redundancy and follows the decentralized philosophy which was originally developed and applied to dual redundant sensor FDI systems on the F-8 aircraft. This philosophy, which is generalized and extended here, addresses the problems associated with 'real-world' model errors. Test results using a nonlinear six-degree-of-freedom aircraft simulation are presented to demonstrate the algorithm's performance. Author

**A86-28393**

**EVALUATION OF CONTROL MIXER CONCEPT FOR RECONFIGURATION OF FLIGHT CONTROL SYSTEM**

K. S. RATTAN (Wright State University, Dayton, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 560-569. refs

(Contract F49620-82-C-0035)

Reconfiguration of flight control law after effector failure is studied in this paper. The objective of this paper is to evaluate the control mixer concept which utilizes generalized inverse to distribute control authority among the remaining effectors after failure. The unmanned research vehicle (URV) was selected as a test bed for evaluating this concept. A mathematical model containing split surfaces and linearized equations of motion for coupled longitudinal and lateral-direction axes is developed. Control mixer gain matrices are obtained for failed surfaces and a comparison of the unimpaired and reconfigured aircraft responses is made using the Continuous System Modeling Program (CSMP). Difficulties encountered with the generalized inverse based control mixer concept are discussed. Author

**AN AUTOMATIC REDESIGN APPROACH FOR RESTRUCTURABLE CONTROL SYSTEMS**

D. P. LOOZE, J. L. WEISS, J. S. ETERNO, and N. M. BARRETT (ALPHATECH, Inc., Burlington, MA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 570-577. refs

(Contract NAS1-17411)

This paper presents an approach to the automatic redesign of flight control systems for aircraft that have suffered one or more control element failures. The procedure is based on Linear Quadratic design techniques, and produces a control system that maximizes a measure of feedback system performance subject to a bandwidth constraint. Author

A86-28395

**YF16CCV FLIGHT CONTROL SYSTEM RECONFIGURATION DESIGN USING QUANTITATIVE FEEDBACK THEORY**

I. HOROWITZ (Weizmann Institute of Science, Rehovot, Israel), P. B. ARNOLD (USAF, Test Pilot School, Edwards AFB, CA), and C. H. HOUPIS (USAF, Institute of Technology, Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 578-585. refs

A fixed compensation design theory is presented for achieving flight control performance, despite one or more simultaneous failures, hardover and varying flight conditions. No identification is used. The theory is a natural extension of Quantitative Feedback Theory (QFT) for uncertain systems, and clearly reveals the cost of feedback needed. This enables the designer to make intelligent trade-offs between fixed compensation, scheduling and identification-adaptation. Identification, when it is necessary, can be done more slowly and accurately if a QFT design is made so the system is at least stable over many simultaneous failures. The theory is applied to the YF16CCV model with elevators and flaperons for pitch and roll rate control. Author

A86-28396

**LOCKHEED-GEORGIA AND ELECTRIC PRIMARY FLIGHT CONTROL SYSTEMS**

K. THOMPSON, R. ALDEN (Lockheed-Georgia Co., Marietta), and L. HUNTER (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 588-595. refs

The designs of various electric actuation systems (EASs) are studied. The components and functions of the C-141 dual channel EAS for the aileron are described. The system operation/fault monitoring of the two channels of the EAS are examined. The performance capabilities of the EAS are compared to a hydraulic power control actuation system. The utilization of EASs to improve STOL capabilities, aircraft survivability, flight stations, and integrated control and avionics is being studied in the High Technology Test Bed program. The development of an electric rudder tab control actuation system and a yaw stability and control augmentation system is analyzed. I.F.

A86-28401

**MICROPROCESSOR CONTROLLED AND MANAGED FLY-BY-WIRE HYDRAULIC ACTUATOR**

C. C. CHENOWETH and D. B. SLAUGH (Boeing Military Airplane Co., Seattle, WA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 628-632.

During the past few years, the greatest technological advances in the aerospace industry have been associated with aircraft flight controls. In connection with these advances, mechanical systems are being replaced by fly-by-wire systems in which the pilot is linked to an array of actuators through a central aircraft control computer complex. A new actuation technology development is presented, taking into account the use of microprocessor-based actuation controllers communicating with aircraft-control computers over digital data buses. Attention is given to the advantages of fly-by-wire systems, aspects of smart actuator development, and future plans. G.R.

A86-28490* E-Systems, Inc., Dallas, Tex.

**AN EXPERT PLANNER FOR THE DYNAMIC FLIGHT ENVIRONMENT**

D. C. CHEN (E-Systems, Inc., Garland Div., Dallas, TX) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1347-1354. refs

(Contract NAG1-288; F49620-82-K-0009)

This paper presents a robust robot planner that functions in the complex and dynamic flight domain. The robot pilot flies an aircraft between two airports and can adjust in flight to changes in the environment such as closed destination airport, thunderstorm in the flight path, and failed engine. The planner adjusts to the world changes by locally patching around the break point instead of complete replanning. The planning architecture is based on the vertical decomposition of domain knowledge, resulting in shallow planning and recovery planning. This robot flight planner can be utilized as the front end of an intelligent flight monitor. The flight planner dynamically generates the references that are used to determine whether the flight crew should be notified of potential problems. The implementation of this robot planner is also discussed. Author

A86-28498

**KNOWLEDGE ENGINEERING FOR A FLIGHT MANAGEMENT EXPERT SYSTEM**

B. M. ANDERSON, J. M. BEAL, C. MCNULTY, and R. C. STERN (Texas Instruments, Inc., Dallas) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1431-1435. refs

The development of an F-16 emergency procedures knowledge base for EPES (emergency procedures expert system) is described. A detailed view of the knowledge acquisition problems is presented, followed by a methodology for efficiently building a knowledge base for emergency procedures. A multiple emergency example is considered (loss of canopy and towershaft failure while cruising at 400 knots above 40,000 feet), where the inference engine resolves a conflict in procedures. D.H.

A86-28499#

**PATH-FINDER - AN HUERISTIC APPROACH TO AIRCRAFT ROUTING**

C. S. LIZZA and G. LIZZA (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1436-1443. refs

A solution is examined for the problem of developing an effective computer algorithm to route aircraft through hostile enemy defenses. The problem was proposed to assist in studies of the impact of varied, onboard countermeasures upon preplanned aircraft routes. The quality of a route can be defined in terms of the cost of interaction between the aircraft and threats encountered along the path. Current methods of automated routing are either inefficient or produce unsatisfactory results. Beginning with a more general description of the problem, a solution is detailed for developing routes by using the AI technique of heuristic search in an A(asterisk) algorithm. The algorithm uses heuristics based upon estimates of the degree of threat interactivity and distance from a point to the goal. Due to the nature of the heuristic, the A(asterisk) algorithm cannot guarantee development of a least-cost path, but the heuristic can be adjusted to ensure reasonably good results in most cases. The flexibility of the algorithm allows application to the specific aircraft routing problem and to other route planning tasks. D.H.

**A86-28509**

**FLYING QUALITIES DESIGN CRITERIA FOR HIGHLY AUGMENTED SYSTEMS**

D. J. MOORHOUSE (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) and W. A. MORAN (McDonnell Aircraft Co., St. Louis, MO) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1536-1545. refs

Interpretation and application of the military flying qualities specification, MIL-F-8785C, as the best guide to excellent flying qualities, is suggested. A summary is given of the government's flight control requirements of the Statement of Work of the STOL and Maneuver Technology Demonstration Program (SMTDP). The program contractor, McDonnell Aircraft Company, has had recent experience developing the digital flight control system of the F/A-18A. Lessons learned from that development are used to define the appropriate interpretations of specific requirements in MIL-F-8785C. These are expressed as preliminary detailed flying qualities criteria for the SMTDP, plus 'second tier' criteria to be used for additional design guidance. D.H.

**A86-28510#**

**MULTIVARIABLE CONTROL LAW DESIGN FOR THE X-29 AIRCRAFT**

J. J. DAZZO and T. L. COURTHEYN (USAF, Institute of Technology, Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1546, 1547.

Flight control laws have been developed for the X-29 forward swept wing demonstrator aircraft, using a design technique based on a multivariable control law theory. The computer-aided design program called MULTI is used to develop and refine the control laws. MULTI also simulates the complete closed-loop control system and generates appropriate time response plots for analysis. Control laws are developed to stabilize the aircraft and to perform longitudinal maneuvers (direct climb, vertical translation, and pitch pointing) at three different flight conditions. The use of a proportional plus integral control law for a digital output feedback flight control system produced very good performance. The ability to incorporate actuator dynamics and computational time delay in the control law generation adds to the design capability. Investigation of further applications is warranted. D.H.

**A86-29058**

**ADVANCING FLIGHT CONTROL TECHNOLOGY**

H. BERMAN (Grumman Aerospace Corp., Bethpage, NY) Horizons (ISSN 0095-7615), vol. 21, no. 3, 1985, p. 14-21.

The development of fly-by-wire (FBW) controls for aircraft has been driven by the need to augment the muscular power expended by pilots to control their aircraft, to provide increasingly greater maneuverability, and to lower the weight penalty of the control mechanisms. The X-29, with a 35 percent negative margin of static stability, is the cutting edge of FBW technology. The reduced stability of the X-29 furnishes the desired enhanced maneuverability, and can only work if the aircraft is continuously under computer control. The X-29 stability is maintained by control adjustment inputs at 40 times per second in a manner transparent to the pilot. The computer is fed a constant stream of flight status data which is analyzed to make the control decisions by means of a polling procedure among three on-board computers. The forward swept supercritical wings of the X-29 are equipped with two-segment trailing edge flaps that make the wings variable camber so the computers can vary the lift/drag characteristics of the wings in-flight. The experimental aircraft is also serving as a testbed for reconfigurable controls which would compensate for the presence of damaged control surfaces, for an automated approach fine-tuning system, and for examining supermaneuverability at flight speeds into the transonic. M.S.K.

**AIRPLANE AUTOMATIC CONTROL FORCE TRIMMING DEVICE FOR ASYMMETRIC ENGINE FAILURES Patent application**

E. C. STEWART, inventor (to NASA) 23 Oct. 1985 14 p (NASA-CASE-LAR-13280-1; NAS 1.71:LAR-13280-1; US-PATENT-APPL-SN-790556) Avail: NTIS HC A02/MF A01 CSCL 01C

The difference in dynamic pressure in the propeller slipstreams as measured by sensors is divided by the freestream dynamic pressure generating a quantity proportional to the differential thrust coefficient. This quantity is used to command an electric trim motor to change the position of trim tab thereby retrimming the airplane to the new asymmetric power condition. The change in position of the trim tab produced by the electric trim motor is summed with the pilot's input to produce the actual trim tab position. NASA

**FAULT TOLERANT HARDWARE/SOFTWARE ARCHITECTURE FOR FLIGHT CRITICAL FUNCTION**

Loughton, England Sep. 1985 146 p refs Lecture series held at Edwards AFB, Calif., 1-2 Oct. 1985, in Copenhagen, Denmark, 17-18 Oct. 1985, and in Athens, Greece, 21-22 Oct. 1985 (AGARD-LS-143; ISBN-92-835-1510-2) Avail: NTIS HC A07/MF A01

This Lecture Series is intended to provide basic concepts and theories in the design of fault-tolerant architectures for flight critical systems. It is intended to cover experience with flight tested fly-by-wire systems as well as issues in redundancy management of synchronous and asynchronous approaches. It will specifically address the individual aspects of software fault tolerance, actuation fault tolerance, reliable data communication, and multi-computer operation using the Ada language.

**N86-20400#** Honeywell Systems and Research Center, Minneapolis, Minn.

**INTRODUCTION TO LECTURE SERIES NO. 143: FAULT TOLERANT HARDWARE/SOFTWARE ARCHITECTURES FOR FLIGHT CRITICAL FUNCTIONS**

G. L. HARTMANN *In* AGARD Fault Tolerant Hardware/Software Architecture 3 p Sep. 1985 refs Avail: NTIS HC A07/MF A01

Modern weapon systems, driven by escalating performance demands, are becoming complex and sophisticated. Demands for higher accuracy, improved reliability/survivability, all-weather operation, and more automation are placing increased emphasis on the control function. Nowhere is this increased emphasis more evident than in the control functions required in advanced aircraft systems. Due to the expanded role of automation many functions are becoming flight-critical (i.e., loss of this function is catastrophic). Flight critical architectures are more complex than fault-tolerant computers. In addition to airborne computers, overall reliability depends on proper design and management of: (1) Sensors and their interfaces; (2) Actuation elements; and (3) Data communication along the distributed elements. Previous NATO-AGARD publications have dealt with related aspects of this subject. This lecture series covers experience with flight tested fly-by-wire systems as well as issues in redundancy management of synchronous and asynchronous systems. It specifically addresses software fault tolerance, actuation fault tolerance, reliable data communications, and multi-computer operation using the Ada language. Author

**STEP AND STEPSPL: COMPUTER PROGRAMS FOR AERODYNAMIC MODEL STRUCTURE DETERMINATION AND PARAMETER ESTIMATION**

J. G. BATTERSON Jan. 1986 142 p refs
(NASA-TM-86410; NAS 1.15:86410) Avail: NTIS HC A07/MF A01 CSCL 01C

The successful parametric modeling of the aerodynamics for an airplane operating at high angles of attack or sideslip is performed in two phases. First the aerodynamic model structure must be determined and second the associated aerodynamic parameters (stability and control derivatives) must be estimated for that model. The purpose of this paper is to document two versions of a stepwise regression computer program which were developed for the determination of airplane aerodynamic model structure and to provide two examples of their use on computer generated data. References are provided for the application of the programs to real flight data. The two computer programs that are the subject of this report, STEP and STEPSPL, are written in FORTRAN IV (ANSI 1966) compatible with a CDC FTN4 compiler. Both programs are adaptations of a standard forward stepwise regression algorithm. The purpose of the adaptation is to facilitate the selection of a adequate mathematical model of the aerodynamic force and moment coefficients of an airplane from flight test data. The major difference between STEP and STEPSPL is in the basis for the model. The basis for the model in STEP is the standard polynomial Taylor's series expansion of the aerodynamic function about some steady-state trim condition. Program STEPSPL utilizes a set of spline basis functions. Author

**EFFECTS OF WING MODIFICATION ON AN AIRCRAFT'S AERODYNAMIC PARAMETERS AS DETERMINED FROM FLIGHT DATA**

R. A. HESS Jan. 1986 72 p refs
(NASA-TM-87591; NAS 1.15:87591) Avail: NTIS HC A04/MF A01 CSCL 01C

A study of the effects of four wing-leading-edge modifications on a general aviation aircraft's stability and control parameters is presented. Flight data from the basic aircraft configuration and configurations with wing modifications are analyzed to determine each wing geometry's stability and control parameters. The parameter estimates and aerodynamic model forms are obtained using the stepwise regression and maximum likelihood techniques. The resulting parameter estimates and aerodynamic models are verified using vortex-lattice theory and by analysis of each model's ability to predict aircraft behavior. Comparisons of the stability and control derivative estimates from the basic wing and the four leading-edge modifications are accomplished so that the effects of each modification on aircraft stability and control derivatives can be determined. **A CONTRIBUTION TO THE DIGITAL COMPENSATION OF PERIODIC DISTURBANCES WITH FREQUENCIES IN BOUNDED INTERVALS Ph.D. Thesis - Technische Univ., Berlin, West Germany**

R. FRORIEP Sep. 1985 141 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-979)
(DFVLR-FB-85-55; ISSN-0171-1342) Avail: NTIS HC A07/MF A01; DFVLR, Cologne DM 45.50

A general design method for the simplest possible compensator was developed in order to satisfy the requirement of stationary disturbance compensation within given tolerance limits for all helicopter rotor speeds within a given bounded interval. The approach to the suppression of rotor induced vibrations is to suspend the fuselage from the rotor by electrohydraulic actuators. Using a digital computer the most dominant harmonics of the disturbance can be actively compensated. For compensation at sampling instants, a structure of a digital controller is introduced and motivated, in which a minimal number of parameters is adapted to a varying rotor speed. The remaining parameters are to be held constant during operation independent of rotor speed. In the design, these parameters are systematically improved with a multidisturbance model approach and a design methodology with vector performance index. For disturbance suppression between sampling instants a design method for impulse forming filters is proposed. Author (ESA)

**FUTURE APPLICATIONS AND PROSPECTS FOR FLIGHT SIMULATION; PROCEEDINGS OF THE SPRING CONVENTION, LONDON, ENGLAND, MAY 9, 10, 1984**

Convention sponsored by the Royal Aeronautial Society. London, Royal Aeronautical Society, 1985, 134 p. No individual items are abstracted in this volume.

The present conference on prospective developments in the field of flight simulation considers the upgrading of simulator technology, the changing role of supplemental simulators, applications of air combat simulation to pilot training, Line Orientation Flight Training inflight simulation, and the development status and future potential of training management systems. Also discussed are human factors and the use of the image visual system to meet training requirements, fiber-optic helmet-mounted displays, AV-8B (Harrier II) training capabilities, B-757/767 program engineering development simulators, third-generation digital flight controls, a military view of future flight simulation capabilities, and the use of simulators in the U.S. Navy's T-45 jet trainer integrated system for carrier aircraft pilots. O.C.

**LOW COST PART TASK TRAINER FOR THE GBU-15 GUIDED BOMB**

J. W. ACKERSON and D. W. RUCK (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1068-1073.

The design and development of an interim part task trainer for the GBU-15 standoff precision attack weapon system for the destruction of fixed targets is described. Using either electro-optical or infrared images transmitted by RF datalink signals, an operator in either in the delivery aircraft or another aircraft guides the bomb to the target. Each trainer, controlled by a microcomputer, generates the required imagery from a photographic filmplate. The benefits of this approach are short development time, minimal manpower requirements, and development of baseline information for future procurement of a more powerful trainer. Author

**MODULAR SIMULATORS - A COMPREHENSIVE UNIFIED ARCHITECTURE**
S. SEIDENSTICKER (Logicon, Inc., Tactical and Training Systems Div., San Diego, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1074-1079.

Various aspects are explored for a comprehensive unified modular approach to design, construction, and procurement of flight simulators. Issues addressed include module definition, interface specification, implementation approaches, standards, and potential impact on technology. At the heart of the architecture is a universal interface that interconnects all modules; this interface is embodied in a high capacity Local Area Network (LAN). D.H.

**MODULAR SIMULATORS - HOW TO MAKE IT WORK**
M.-E. HECKER (Logicon, Inc., Tactical and Training Systems Div., San Diego, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1080-1085.
(Contract F33657-83-C-2201)

Factors to be considered in building complex modular simulators are examined. The functions of simulators are divided among carefully defined modules, which may each come from a different vendor. The modules must both send and receive messages necessary for running of their respective modeling and environmental simulation programs. Interfaces must be standardized and not require unique design or contractor proprietary information. Flexibility to incorporate good new engineering developments at a late stage is necessary. To accomplish such a complex task, there must be defined from the outset a central authority (to control module and message definition), a separate support module (which functions specifically to monitor logistics and support), and a users' group (to explore new ideas and exchange findings). D.H.

**MODULAR SIMULATORS - IS A LOCAL AREA NETWORK SUFFICIENT?**
D. L. JOHNSTON (Logicon, Inc., Tactical and Training Systems Div., San Diego, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1086-1093. refs
(Contract F33657-83-C-2201)

A local area network, Ethernet, is examined for its use in modular flight simulators. A computer model of a data communication network is developed to assess the capacity and timing of Ethernet. Estimates of the communication requirements for modular configurations of T-37 and F-16 simulators are used with the network model. The results show that Ethernet will easily transfer the data required for real-time operation by these simulator configurations. Author

**INSTRUCTOR STATION FOR THE ILLIMAC GENERAL AVIATION INSTRUMENT TRAINING SIMULATOR**
H. L. TAYLOR, F. C. HYMAN, R. E. TODD, and A. S. HODEL (Illinois, University, Urbana) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1111-1118.

A software program that permits a standard computer terminal to be used as an instructor station was developed for the University of Illinois Micro Aviation Computer (ILLIMAC) simulator. A split screen format was used to display menus, from which instrument training scenarios could be developed, and to display information on the current status of the instructor inputs to the simulator. A training manual was developed to provide self-paced instruction on the operation of the instructor station. Twelve flight instructors evaluated the effectiveness of the training manual and the instructor station. Results indicated that scenarios could be entered without assistance with a minimum error rate after about one hour self-paced training. Response to a questionnaire on the effectiveness of the training program and the instructor station was very positive. Author

**RUBBER REMOVAL SPECIFICATION DEVELOPMENT Final Report, May 1983 - Sep. 1985**
R. A. GRAUL, L. R. LENKE, and D. L. STANDIFORD Oct. 1985 56 p refs Prepared in cooperation with Air Force Engineering Services Center, Tyndall AFB, Fla.
(Contract F29601-84-C-0080)
(FAA/PM-85/33; ESL-TR-85-67) Avail: NTIS HC A04/MF A01

The phenomenon of runway touchdown-zone rubber buildup is a potentially hazardous problem. Rubber buildup covers the runway surface and occludes the surface texture. This results in a reduced wet friction coefficient between the runway pavement and aircraft tires. Methods and equipment are available for evaluating the wet friction coefficient; however, these methods are expensive and require highly trained personnel. Currently, no guidelines have been established for determining the need and effectiveness of rubber removal. Therefore, most airport and airbase managers rely exclusively on visual impressions of rubber buildup in lieu of quantitative measurements. Quantitative evaluation techniques are desirable for evaluating rubber buildup. An extensive literature review suggested that pavement surface texture measurement techniques are indicative of rubber buildup and resultant reduction in wet friction coefficients. A statistically designed field experiment

determined that surface texture measurements were indicative of pavement friction levels; however, these relationships lacked the precision necessary for inclusion in performance specifications.

(Contract NAG1-541)
(NASA-CR-176520; NAS 1.26:176520) Avail: NTIS HC A06/MF A01 CSCL 22B

Theoretical models were developed capable of predicting structural response and noise transmission to random point mechanical loads. Fiber reinforced composite and aluminum materials were considered. Cylindrical shells and circular plates were taken as typical representatives of structural components for space station habitability modules. Analytical formulations include double wall and single wall constructions. Pressurized and unpressurized models were considered. Parametric studies were conducted to determine the effect on structural response and noise transmission due to fiber orientation, point load location, damping in the core and the main load carrying structure, pressurization, interior acoustic absorption, etc. These analytical models could serve as preliminary tools for assessing noise related problems, for space station applications.

**A86-26326**
**CONFERENCE ON STEELS AND SPECIAL ALLOYS IN AERONAUTICS, 11TH, LE BOURGET, FRANCE, JUNE 6, 1985, PROCEEDINGS [COLLOQUE SUR LES ACIERS ET LES ALLIAGES SPECIAUX DANS L'AERONAUTIQUE, 11TH, LE BOURGET, FRANCE, JUNE 6, 1985, PROCEEDINGS]**
Materiaux et Techniques (ISSN 0032-6895), Oct.-Nov. 1985, 158 p. In French and English. For individual items see A86-26327 to A86-26338.

Three different development status assessments are presented by leading industry representatives for French advancements in the formulation and processing of aircraft specialty steels, aluminum alloys, and titanium alloys. Performance comparisons are persistently made in view of continuing improvements in the field of advanced organic matrix composites, especially those composites reinforced with continuous carbon fibers. The meeting at which these evaluations were made covered new developments in airliner, helicopter, and spacecraft structures, novel primary aircraft structure materials, landing gear metals, the evolution of turbine blade materials, single crystal superalloys for gas turbine blades, turbofan thrust reverser materials, novel aluminum alloys, trends in Ti alloy processing technology development, thermomechanical processing during closed dye forging, and high strength stainless steels.
O.C.

**A86-26327**
**NEW DEVELOPMENTS IN THE MATERIALS USED IN AIRLINER, HELICOPTER AND SPACECRAFT STRUCTURES [EVOLUTION DES MATERIAUX UTILISES DANS LES STRUCTURES DES AVIONS, HELICOPTERES ET ENGINS]**
J. ODORICO (Aerospatiale, Paris, France) (Colloque sur les Aciers et les Alliages Speciaux dans l'Aeronautique, 11th, Le Bourget, France, June 6, 1985) Materiaux et Techniques (ISSN 0032-6895), Oct.-Nov. 1985, p. 531-539. In English and French.

A development status and development trend evaluation is undertaken for advanced materials applicable to commercial aircraft, helicopter and spacecraft primary structures. In the case of high strength steels, little developmental success is seen in recent work which is (which is primarily concerned with damage tolerance); by contrast, promising trends are noted in superplastic forming/diffusion bonding techniques for titanium alloys. Especially encouraging are activities in the formulation of novel aluminum alloys employing additions of zinc, copper, and lithium, and in the application of bonded aluminum sheet/aramid fiber laminates (Arall). Attention is given to performance gains over metallic materials that are obtainable by means of carbon fiber-reinforced plastics. O.C.

**A86-26328**

**WHAT DOES THE FUTURE HOLD FOR 1990'S NEW AIRFRAME MATERIALS [LA PLACE DES MATERIAUX NOUVEAUX DANS LES CELLULES D'AVIONS DES ANNEES 1990]**

D. CHAUMETTE (Avions Marcel Dassault-Breguet Aviation, Vaucresson, France) (Colloque sur les Aciers et les Alliages Speciaux dans l'Aeronautique, 11th, Le Bourget, France, June 6, 1985) Materiaux et Techniques (ISSN 0032-6895), Oct.-Nov. 1985, p. 541-546. In English and French.

Development trends are projected into the 1990s for the application of advanced steels, aluminum alloys such as aluminum-lithium, titanium, and carbon or kevlar fiber-reinforced composites, to the construction of a major French manufacturer's aircraft. It is noted that aluminum-lithium alloys' attractiveness is detracted from by their appearance at the very moment when second-generation carbon fibers (for polymer matrix reinforcement) with markedly improved strength and rigidity are becoming commercially available. Predictions are made for prospective usage of these materials in combat aircraft such as the Rafale fighter, business aircraft, and the Hermes spacecraft. O.C.

**A86-26329**

**DEVELOPMENT OF MATERIALS USED IN LANDING GEAR [EVOLUTION DES MATERIAUX DANS LES ATTERRISSEURS]**

G. HENAULT (Messier-Hispano-Bugatti, Montrouge, France) (Colloque sur les Aciers et les Alliages Speciaux dans l'Aeronautique, 11th, Le Bourget, France, June 6, 1985) Materiaux et Techniques (ISSN 0032-6895), Oct.-Nov. 1985, p. 547-558. In English and French.

In aircraft landing gear fabrication, semifinished castings and forgings of precisely formulated materials may represent as much as 40 percent of the cost of the finished component after machining and assembly. The present evaluation of the development status and trends in this industry notes no revolutionary developments or prospects; steels will remain the primary materials for landing gear applications. The high strength 7000-series alloys are in more general use, and 7010-T736 has been chosen for further development. Ti alloys and composites are not expected to make substantial inroads into landing gear design. O.C.

**A86-26330**

**THE EVOLUTION OF TURBINE BLADE MATERIALS [L'EVOLUTION DES MATERIAUX POUR AUBES DE TURBINE]**

J.-P. HERTEMAN (SNECMA, Paris, France) (Colloque sur les Aciers et les Alliages Speciaux dans l'Aeronautique, 11th, Le Bourget, France, June 6, 1985) Materiaux et Techniques (ISSN 0032-6895), Oct.-Nov. 1985, p. 559-566. In English and French. refs

The joint development of precision investment casting processes and of high creep strength/low work hardening rate materials has been a primary factor in the continuing increase of aircraft gas turbine inlet temperatures. The development of single crystals, oxide dispersion-strengthened, and oriented eutectic alloys has been especially fruitful. Significant advancements are expected in the case of single crystal alloys, through a gradual reduction of specific gravity, which will reduce the stresses currently borne by turbine disks. O.C.

**A86-26332**

**MATERIALS IN THRUST REVERSERS [LES MATERIAUX DANS LES INVERSEURS DE POUSSEE]**

G. LADOUX (Hispano-Suiza, Saint-Cloud, France), R. CAMEO (Microfusion, S.A., Gennenvilliers, France), and J. BARILLOT-CREUZET (Ets Robert Creuzet Sarl, Marmande, France) (Colloque sur les Aciers et les Alliages Speciaux dans l'Aeronautique, 11th, Le Bourget, France, June 6, 1985) Materiaux et Techniques (ISSN 0032-6895), Oct.-Nov. 1985, p. 579-584. In English and French.

The design features of contemporary high bypass turbofan thrust reverser mechanisms, which are integral parts of the engine cowl paneling, are presently discussed with a view to the materials and fabrication technologies that satisfy such devices' performance criteria. Steel have limited use in fasteners and hydraulic tubing. Aluminum alloys constitute the largest portion of material used, with the remainder made up of epoxy-matrix composite materials. Aluminum elements are fabricated from forged blocks, thick sheet metal, precision castings, thin sheet honeycomb cores, pressings, superplastically formed plates, and extrusions. Carbon/epoxy composite paneling is essential for noise-control purposes. O.C.

**A86-26334**

**THE NEW ALUMINIUM ALLOYS FOR THE AERONAUTICAL INDUSTRY [LES NOUVEAUX ALLIAGES D'ALUMINIUM POUR L'AERONAUTIQUE]**

P. MEYER (Cegedur Pechiney, Centre de Recherche et Developpement de Voreppe, France) and S. DERMARKAR (Cegedur Pechiney, Department Techniques Avancees, Paris, France) (Colloque sur les Aciers et les Alliages Speciaux dans l'Aeronautique, 11th, Le Bourget, France, June 6, 1985) Materiaux et Techniques (ISSN 0032-6895), Oct.-Nov. 1985, p. 593-601. In English and French.

A development status and prospective structural performance evaluation is presented for recent advancements in the field of aircraft aluminum aloys that encompass Al-Li alloys, powder metallurgy alloys, and aluminum-matrix composites. The four Al-Li alloys in question, designated CP 271, 274, 276, and 277, respectively offer density reductions of 10, 8, 8, and 12 percent over conventional aircraft alloys. Attention is given to the performance improvements obtainable by means of short and long fiber reinforcement of aluminum alloy matrices, especially with respect to specific elastic modulus and specific ultimate tensile strength. O.C.

**A86-26337**

**THE DEVELOPMENT OF HIGH STRENGTH STAINLESS STEELS FOR THE AERONAUTICAL INDUSTRY [EVOLUTION DES ACIERS INOXYDABLES A HAUTE RESISTANCE POUR CONSTRUCTION AERONAUTIQUE]**

R. RAVEZ (Acieries Aubert et Duval, S.A., Neuilly-sur-Seine, France), M. DELARBOULAS, and R. COZAR (Imphy, S.A., Paris-la-Defense, France) (Colloque sur les Aciers et les Alliages Speciaux dans l'Aeronautique, 11th, Le Bourget, France, June 6, 1985) Materiaux et Techniques (ISSN 0032-6895), Oct.-Nov. 1985, p. 619-621. In English and French.

An account is given of the development history of high strength stainless steels possessing good drop forge-shaping ductility, which facilitates the production of aircraft structural components. Attention is given to maraging stainless steels from which the carbides and ferrite that compromise ductility in other formulations can be entirely eliminated. The engine nacelle strut of the A 320 airliner has been fabricated from such a steel; histograms of dispersions obtained during acceptance tests for these components are presented. Tensile strenths are of the order of 1200-1250 MPa. O.C.

### THE DAMPING CAPACITY OF LAYERED MATERIALS [DEMPFIRUIUSHCHAIA SPOSOBNOST' SLOISTYKH MATERIALOV]

V. N. VIAKIN, G. G. KARTASHOV, N. S. KONDRASHOV, and V. I. SUSLIKOV IN: Energy dissipation connected with vibrations of mechanical systems . Kiev, Izdatel'stvo Naukova Dumka, 1985, p. 215-225. In Russian. refs

The paper reports the results of an experimental study of the damping properties of layered materials consisting of a combination of adhesives and sealants with metal layers or with layers of metal and nonmetal composites. On the basis of the results obtained, the damping properties of a titanium-base sound-absorbing material have been improved by saturating it with a viscoelastic filler, and efficient sound-absorbing structures have been developed by using composite materials. The results of the study are currently used for developing shells and enclosures for gas-turbine engines. V.L.

### STRENGTH PROFILE IN AL-LI PLATE MATERIAL

M. PETERS, J. ESCHWEILER, and K. WELPMANN (DFVLR, Institut fuer Werkstoff-Forschung, Cologne, West Germany) Scripta Metallurgica (ISSN 0036-9748), vol. 20, Feb. 1986, p. 259-264. refs

An explanation is sought for an anisotropic strength profile seen in low-density, high-stiffness Al-Li alloys, in plate form, where tensile properties showed a variation through the plate thickness. The alloy investigated was DTD XXXA with a nominal composition in weight percent of Al-2.5Li-1.2Cu-0.7Mg-0.12Zr. The results suggest that the strong strength gradient observed is primarily due to texture hardening. (111) pole figures are given for DTD XXXA and 2024 plate material for comparison purposes. D.H.

### TITANIUM: SCIENCE AND TECHNOLOGY; PROCEEDINGS OF THE FIFTH INTERNATIONAL CONFERENCE ON TITANIUM, MUNICH, WEST GERMANY, SEPTEMBER 10-14, 1984. VOLUMES 1-4

G. LUETJERING, ED. (Hamburg, Technische Universitaet, West Germany), U. ZWICKER, ED. (Erlangen-Nuernberg, Universitaet, Erlangen, West Germany), and W. BUNK, ED. (DFVLR, Cologne, West Germany) Conference supported by DFG. Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985. Vol. 1, 719 p.; vol. 2, 820 p.; vol. 3, 726 p.; vol. 4, 724 p. For individual items see A86-27202 to A86-27421.

Numerous Ti alloy preparation, processing and recycling techniques are discussed. Attention is given to methods of reducing or recycling the amounts of waste chips and/or pollutants which are byproducts of the production and shaping of Ti alloys. The benefits and drawbacks of various techniques for melting Ti ingots and chips are explored, along with the microstructures of hot isostatically pressed materials. Forming techniques such as hot die forming, rolling and extrusion are investigated as to their effects on the microstructures of finished billets, their relative costs, and their capabilities of yielding near-net shape parts. Finally, the potential for using new techniques which require lower heats and thereby reduced costs so that parts can be manufactured from more economical Ti alloys at competitive costs are investigated. M.S.K.

**A86-27202**

### APPLICATIONS OF TITANIUM AND TITANIUM ALLOYS

T. W. FARTHING (IMI Titanium, Ltd., Birmingham, England) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 1 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 39-54.

Areas of applications of Ti alloys are surveyed, together with the prospects of improving the quality of the products. The demand for Ti products will continue to rise due to the favorable properties of Ti in aircraft components, even though the number of aircraft produced may not increase by much. Ti offers high temperature creep resistance, improved performance from rotating parts, and can be shaped using techniques such as superplastic forming and diffusion bonding. New gas turbine engines feature up to 25 percent by weight Ti, mainly in the blades, disks and housing. The same percentage is used in current military aircraft airframes and control surfaces, falling to 7 percent in commercial aircraft. Attempts are being made to increase the percentage of parts by increasing the quality of HIP-manufactured components. In other areas, Ti has proven useful in salt water environments, particularly for deep-sea diving vessels and heat exchangers. Ti alloys have shown no adverse effects when used in prosthetic devices and have shown no adverse effects when used in prosthetic devices and have exhibited favorable properties when combined with other elements in superconductors. M.S.K.

### AN EVALUATION OF CENTRIFUGALLY CAST TI-4AL-4MO-2SN-0.5SI (IMI 550) ALLOY

M. W. KEARNS (IMI Titanium, Ltd., Birmingham, England) and C. M. WARD-CLOSE (Royal Aircraft Establishment, Farnborough, England) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 1 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 195-202. Research supported by the Ministry of Defence (Procurement Executive). refs

The results of tests of the room temperature tensile, fracture toughness and plain and notched high cycle fatigue life of centrifugally cast and cast/HIPped IMI 550 Ti alloy are reported. Three specimens, 70, 125 and 180 mm long, were centrifugally cast and subjected to HIP conditions and heat treatment of 1 hr at 900 C, air cooling and aging for 24 hr at 500 C. Other samples were prepared with the same process as Ti-6Al-4V and with varying thickness as would be found in an aerospace component. The mechanically tested parts were examined by radiography and microscopy. The fully aged IMI 550 alloy yielded a 20 percent increase in mechanical properties compared to samples of Ti-6Al-4V. The HIP process eliminated shrinkage porosity by retained the beta acicular features. However, HIPping increased the plain specimen fatigue performance to twice that of comparable wrought alloy materials. M.S.K.

### REQUIREMENTS FOR RECYCLING OF VALUABLE CHIPS FROM AND FOR AIRCRAFT MANUFACTURING

J. BERGGREEN (Messerschmitt-Boelkow-Blohm GmbH, Augsburg, West Germany) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 1 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 241-248.

The ratio of scrap chips of Ti to the actual materials used in making stiffened airframes can appraoch 100:1, although chips are valued at only 0.01 the worth of raw material. Neither electrolytic dissolving nor powdering of the chips to obtain useful Ti alloy forms is a cost-effective process. Another significant impediment to recycling the chips is keeping them from being mixed with other materials, such as cigarette ends, glass splinters, other metal scraps, milling coolants, etc., in the shop. A system is described whereby the chips are removed from the workbench by vacuum suction or conveyers and transferred to a storage location. The chips are carried to a recycling plant in sealed containers which are inspected by X ray techniques. Remelted scrap handled to avoid contamination has exhibited mechanical properties and chemical composition equivalent to the original Ti sponge, provided the oxygen content is closely controlled during remelt and sufficient sponge material is added to the melt. M.S.K.

**A86-27224**

**DEVELOPMENT IN PM HHDH-TI6AL4V TECHNOLOGY FOR AIRCRAFT APPLICATION**

R. TANG, T. LAN, and C. LU (Baoji Institute for Nonferrous Metal Research, People's Republic of China) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 1 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 443-450. refs

The preliminary results of the development in the High-quality Hydride Dehydriding Process (HHDH) on PM Ti6Al4V alloy for aircraft applications are described in the paper. The powder characteristics and the mechanical properties of HHDH-Ti6Al4V alloy consolidated by HIP are presented. The effects of HIP temperature, powder particle size and its oxygen content on the microstructure and mechanical properties of HHDH-Ti6Al4V alloy are discussed in detail. The experimental result shows that the mechanical properties of the HHDH alloy can be compared with the best properties of HIP'ed centrifugal atomization Ti6Al4V and conventional wrought material reported up to now. Furthermore, the HHDH process has even more advantages and possesses the competition in the cost effectiveness. Therefore, the HHDH process will be a more economical and important approach to manufacture the PM titanium alloy components for aircraft applications. M.S.K.

**A86-27231**

**EFFECT OF PROCESSING AND HEAT TREATMENT ON THE MECHANICAL PROPERTIES OF TI-6AL-2SN-4ZR-6MO ALLOY**

H. YANO, Y. TSTUMORI, T. MATSUMOTO, K. YASUI, and T. NISHIMURA (Kobe Steel, Ltd., Japan) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 1 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 507-514.

Experimental trials were run to determine the minimum forging reduction in the alpha-beta field to obtain good ductility for the alloy Ti-6246. Attention was also given to the impacts that solution treatment conditions have on the mechanical properties of the alloy. Various forging reductions up to 80 percent in the alpha-beta field were imposed on alloy bars forged at 900 C. The bars were later tested for the tensile properties. Heat treatment effects were evaluated in terms of the results of tensile, notch test, and creep tests. Tensile strength was not affected by the forging reduction while elongation and areal reduction were both observed with forging reductions of 53-63 percent. The amount of age hardening determined the tensile strength of the end product. A double solution treatment produced enhanced tensile strength and creep resistance. The second treatment caused the material to become at least 10 percent alpha phase. The mechanical properties of all the solution treated die forged specimens satisfied criteria for use as jet engine disks. M.S.K.

**A86-27260**

**PROPERTIES OF DIFFUSION BONDED BUTT JOINTS IN TI-6AL-4V AND TI-4AL-4MO-2SN-0.5SI (IMI 550) ALLOYS**

T. S. BAKER and P. G. PARTRIDGE (Royal Aircraft Establishment, Farnborough, England) IN: Titanium: Science and Technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 2 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 861-868. refs

A critical requirement for successful superplastic forming/diffusion bonding of Ti-6Al-4V and IMI550 Ti alloys is an understanding of the factors affecting the mechanical properties of diffusion bonds. Tensile, fatigue and impact strengths are presently determined for butt joints containing various amounts of residual porosity at the interface, following diffusion bonding. The results obtained suggest that, unless impact strength is more sensitive to the presence of very small voids than is the fatigue testing method, toughness is reduced by the presence of an oxygen-rich region near the bond interface. O.C.

**A86-27264**

**FATIGUE-CRACK PROPAGATION THROUGH TITANIUM WELDS**

P. S. PAO, T. C. PENG, and J. E. ONEAL (McDonnell Douglas Research Laboratories, St. Louis, MO) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 2 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 887-894. Research supported by the McDonnell Douglas Independent Research and Development Program. refs

Attention is given to the influence exerted by gas-tungsten arc, electron beam, and laser beam weldment microstructures on the mechanical properties and fatigue crack growth kinetics of the alpha-beta alloy Ti-6Al-4V and the beta alloy Ti-15V-3Cr-3Al-3Sn. Modified wedge-opening-load specimens oriented either longitudinally or transversely were used to determine crack growth kinetics. It is found that the fatigue crack growth rates through the weld zones of both alloys are not significantly affected by the three welding processes, although scatter bands for electron and laser beam welding are narrower than for the gas-tungsten arc process. O.C.

**A86-27274**

**FATIGUE PROPERTIES OF TI-10V-2FE-03AL**

R. S. CAREY (Beckman Instruments, Inc., Palo Alto, CA), R. R. BOYER (Boeing Co., Seattle, WA), and H. W. ROSENBERG (Timet, Pittsburgh, PA) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 2 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 1261-1267. Research supported by the Boeing Co. and Timet.

The near-beta titanium forging alloy Ti-10V-2Fe-3Al has come to find frequent use in state-of-the-art commercial aircraft in virtue of its outstanding combination of weight reduction-yielding strength and toughness; recent investigations have noted excellent fatigue strength, as well. Attention is presently given to the results of investigations concerning applications where fatigue may be a critical factor: commercial airframes, helicopters, and centrifuges. In each case, Ti-10V-2Fe-3Al appears to outperform the heretofore more prominent Ti-6Al-4V alloy. O.C.

**A86-27275**

**FATIGUE BEHAVIOUR OF TITANIUM MATERIALS IN AIRCRAFT ENGINES**

R. GRAETER and H. HUFF (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 2 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 1269-1273.

Because the fatigue strength of titanium and its alloys is strongly influenced by such factors as surface finish, structure topology and material microstructure, as well as by fretting, precise definitions of surface and structure are required. An evaluation is presently made of the interrelationships among these factors, with attention to the consequences of microstructure type, the influence of tool-originated flaws on structure surface, and the geometry of loads incurred during operation (in such cases as turbomachine blades) which cause significant fretting. O.C.

**A86-27279**

**EMBRITTLED TRAILING EDGES OF COMPRESSOR BLADES (TITANIUM ALLOY TI6AL-4V AND TI6AL2SN4ZR2MO) OF GAS TURBINE AERO-ENGINES**

J. SPECHT (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 2 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 1301-1306.

The embrittlement recently noted at the trailing edges of aircraft gas turbine compressor blades is due to hydrogen, which is present in the form of titanium hydride; its absorption may be promoted by the rough airfoil surface at the upper half of the trailing edge, which is caused by surface enlargement. Hydrogen absorption is found to occur, not from moisture during operation, but from cleaning baths given in the course of maintenance with a solution of NaOH + $Na_2Cr_2O_7$. The cleaning procedure has accordingly been modified. O.C.

**A86-27370**

**THE FRETTING FATIGUE BEHAVIOUR OF THE TITANIUM ALLOY TI-6AL-4V**

E. BROSZEIT, K. H. KLOOS, and B. SCHWEIGHOEFER (Darmstadt Technische Hochschule, West Germany) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 4 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 2171-2178. DFG-supported research.

The phenomenon of fretting can be observed in many cases. It can arise, for instance, at the blade foot of turbine blades. In this case, weld marks can be the consequence of oscillating sliding movements of very small amplitude. In aircraft engines with turbine blades made from titanium alloys, macrocracks can develop as the result of fretting. The considered study is concerned with the fretting fatigue behavior of the material combination Ti-6Al-4V/Ti-6Al-4V, taking into account the feasibility of improvements on the basis of material and surface modifications. It is found that the fretting fatigue properties of the considered material combination can be improved by a number of approaches, giving attention to the combination of high residual compressive stresses with a shear resilient surface. Such a surface can be obtained by selecting a favorable machining process, or by applying soft coatings. G.R.

**A86-27383**

**THE STRAIN CONTROLLED FATIGUE BEHAVIOUR OF A NEAR-ALPHA TITANIUM ALLOY**

M. R. WINSTONE and M. J. WEAVER (Royal Aircraft Establishment, Farnborough, England) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 4 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 2275-2280. refs

This paper presents the results of an investigation which has been conducted to assess the strain controlled fatigue behavior of the near-alpha titanium alloy IMI 829 in the temperature range from 20 to 300 C. A zero to maximum strain cycle was employed for all the tests. Attention is given to details regarding the experimental procedure, the results, and aspects of engineering significance. When the near-alpha titanium alloy IMI 829 was fatigue tested under strain control using O-Max triangular waveform (0.0167 Hz), the life to failure for a given inelastic strain range was found to increase slightly with temperature in the range from 20 to 300 C. At 20 C and 80 C, the introduction of a 120 second hold time at maximum strain increases the inelastic strain range for a given cyclic life, whereas at 120 and 300 C, the relationship remains unchanged. G.R.

**A86-27384**

**STUDIES ON CRACK GROWTH RATE OF HIGH TEMPERATURE TITANIUM ALLOYS**

S. FUJISHIRO (USAF, Materials Laboratory, Wright-Patterson AFB, OH) and T. MATSUMOTO (Kobe Steel, Ltd., Japan) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 4 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 2281-2288. refs

The present study is concerned with the identification of a processing method which provides the lowest crack growth rate for high temperature Ti alloys commonly employed in aircraft engines. Ti-6246, which is utilized in advanced jet engine components, has a very high strength. However, prior studies indicate that this alloy has a much faster fatigue crack growth (FCG) rate than other high-temperature Ti alloys. Investigations were, therefore, conducted with the aim to improve the FCG rate of Ti-6246 by thermomechanical processing, taking into account also Ti-6242S, and Ti-64. At room temperature, Ti-6246, regardless of the type of processing used, was found to have the fastest FCG rate of all alloys studied. G.R.

**A86-27385**

**HIGH TEMPERATURE FATIGUE BEHAVIOR OF IMI 685**

R. MARISSEN, M. PETERS, K. SCHULTE, K.-H. TRAUTMANN, and H. NOWACK (DFVLR, Institut fuer Werkstoff-Forschung, Cologne, West Germany) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 4 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 2289-2296. DFG-supported research. refs

Near-alpha-titanium alloys show a high/specific strength combined with good corrosion resistance, and, when compared to the (alpha+beta)-Ti alloys, superior high temperature properties. For this reason, the considered alloys are widely used as compressor disk material for gas turbine aircraft engines, and information about fatigue crack initiation and crack propagation is important. The present paper is concerned with the crack propagation stage. A description is given of studies performed on the near-alpha Ti alloy IMI 685 (Ti-6Al-5Zr-0.5Mo-0.25Si). It is found that a fine equiaxed and a coarse lamellar microstructure shows considerably lower crack growth rates as compared to a fine equiaxed microstructure for room temperature as well as for 450 C. G.R.

**A86-27388**

**DEVELOPMENTS IN HIGH TEMPERATURE ALLOYS**

P. A. BLENKINSOP (IMI Titanium, Ltd., Birmingham, England) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 4 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 2323-2338. refs

The earliest work concerning high temperature alloys was carried out in the U.S. in the early 1950s. The alloys considered included alpha phase alloys, alpha+beta phase alloys, and meta-stable beta phase alloys. It was soon recognized that solid solution strengthening of the alpha phase with additions of Al, Sn, and Zr provided improvements in room and elevated temperature tensile and creep properties. Attention is given to attempts to develop 'super alpha' alloys in the mid to late 1950s, UK alloys in this group, the Ti+beta stabilizing element, Ti+alpha and beta stabilizing elements, advances in the development of creep resistant titanium alloys in the late 1950s, effects of an addition of Zr and Si, major developments related to aircraft engines and the acceptance of titanium alloys in the 1960s, and a major change of alloy philosophy occurring in the UK. Recent developments discussed are related to the importance of fatigue strength, the utilization of the effect of the cooling rate, and new development alloys. New developments are partly concerned with the temperature barrier at 600-650 C. G.R.

### ANALYTICAL AND EXPERIMENTAL STUDIES OF TEXTILE STRUCTURAL COMPOSITES

T.-W. CHOU (Delaware, University, Newark), B. I. SHEHATA (U.S. Army, Ballistic Research Laboratory, Aberdeen Proving Ground, MD), and J.-M. YANG IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 13 p. Army-Navy-supported research. refs

This paper reports the recent research in modeling the thermo-elastic behavior of textile structural composites and the parametric study of composite performance. Firstly, a three-dimensional finite-element analysis has been performed to determine the elastic properties of plain weave fabric composites, which have not been accurately predicted by the previous modeling work. The theoretical and experimental results coincide very well. Secondly, a parametric study has been performed on cross-ply, angle ply, woven fabric and three-dimensional braided composites. The variation of thermo-elastic properties of these composites with fiber and matrix properties, fiber orientation, and weaving and braiding parameters have been identified. The unique performance of textile structural composites has been demonstrated. Author

### LIFE PREDICTION FOR AROMATIC POLYAMIDE REINFORCEMENTS

A. HOWARD and N. J. PARRATT (Royal Armament Research and Development Establishment, Waltham Abbey, England) IN: ICCM - V; Proceedings of the Fifth International Conference on Composite Materials, San Diego, CA, July 29-August 1, 1985 . Warrendale, PA, Metallurgical Society, Inc., 1985, p. 277-292. refs

Mechanical tests have been carried out on Kevlar 49 yarn of 1420 denier with a view to estimating the useful life of this aromatic polyamide fiber used in aircraft and missile composite structures. It is shown that the tensile creep observed in Kevlar 49 yarn under dry conditions is reversible and unrelated to the loss of strength with time. There is instead a consolidation of the normal fiber under stress, reflected in a permanent increase in elastic modulus. From stress-rupture data at 150, 110, and 65 C, the most probable yarn lifetimes are predicted at temperatures between 25 and 200 C and stress levels between 10 and 70 percent of the ultimate strength. V.L.

### S-2 GLASS FIBER - ITS ROLE IN MILITARY APPLICATIONS

S. J. WALLING (Owens-Corning Fiberglas Corp., Advanced Composites Marketing Section, Toledo, OH) IN: ICCM - V; Proceedings of the Fifth International Conference on Composite Materials, San Diego, CA, July 29-August 1, 1985 . Warrendale, PA, Metallurgical Society, Inc., 1985, p. 443-456.

An introduction to S-2 glass fiber products, the fiber and composite properties, and the benefits of the products is presented. Comparative data for S-2 glass and E-glass are given, including physical properties, thermal properties, electrical properties, corrosion resistance, tensile and shear strength. The strength properties of laminates of these glasses are shown. Current applications of S-2 fibers are discussed, stressing lightweight composites in military vehicle structures and armor. C.D.

### DIFFUSION OF WATER IN CARBON EPOXY COMPOSITES

M. A. GRAYSON and C. J. WOLF (McDonnell Douglas Research Laboratories, St. Louis, MO) IN: ICCM - V; Proceedings of the Fifth International Conference on Composite Materials, San Diego, CA, July 29-August 1, 1985 . Warrendale, PA, Metallurgical Society, Inc., 1985, p. 1463-1473. refs

An innovative method, Precision Abrasion Mass Spectrometry (PAMS), has been used to investigate the diffusion of water in a high performance neat epoxy resin, a unidirectional carbon epoxy composite, and a cross-ply carbon epoxy composite. Test coupons were immersed in water at 50, 65, and 80 C for time intervals up to 5000 h. PAMS and gravimetric data were used to investigate diffusion processes in these materials. Two diffusion processes are observed in the resin, one fast and presumably Fickian, the other a factor of 30 slower and non-Fickian. The early stages of diffusion in the resin and the composites are essentialy the same and have an activation energy of 49 kJ/mol. The diffusion coefficient in the unidirectional composite, calculated on the basis of the fibers occupying a finite volume, is in good agreement with the measured values. Author

### NEW ARAMID DEVELOPMENTS FOR AEROSPACE/AIRCRAFT APPLICATIONS

J. J. PIGLIACAMPI and G. E. ZAHR (Du Pont de Nemours and Co., Wilmington, DE) IN: ICCM - V; Proceedings of the Fifth International Conference on Composite Materials, San Diego, CA, July 29-August 1, 1985 . Warrendale, PA, Metallurgical Society, Inc., 1985, p. 1545-1556.

Near-term aramid fiber research and development is discussed, with emphasis on its utility in aircraft/aerospace applications. The tensile strength and adhesion characteristics of new aramid fibers are given and their practical significance is addressed. New products with aramid fibers are described, including improved roving for pressure vessels, low denier Kevlar 49, short fibers, pulp-reinforced elastomers, and low-density spunlaced aramid sheet products. New applications of aramid fibers in the areas of phenolic systems for aircraft interiors, radomes, and supertough wrapped rods are discussed. C.D.

**SYNTHETIC LUBRICANTS AND WORKING FLUIDS; INTERNATIONAL COLLOQUIUM, 4TH, ESSLINGEN, WEST GERMANY, JANUARY 10-12, 1984, REPORTS [SYNTHETISCHE SCHMIERSTOFFE UND ARBEITSFLUESSIGKEITEN; INTERNATIONALES KOLLOQUIUM, 4TH, ESSLINGEN, WEST GERMANY, JANUARY 10-12, 1984, VORTRAEGE]**

W. J. BARTZ, ED. Esslingen, West Germany, Technische Akademie Esslingen, 1984, 640 p. In German and English. No individual items are abstracted in this volume.

Important subjects relevant to synthetic fluids and their application as lubricants and operational fluids are discussed. The topics covered include: ester base stocks, analysis of ester constituents in synthetic and semisynthetic oils, brake fluids, lubrication of plastics by perfluoropolyether fluids, frictional behavior of experimental synthetic and semisynthetic gear oils, potential performance of synthetic fluids for automotive gear oil applications, process variables in the manufacture of polyalphaolefins, synthetic lubricants for turbocharged passenger cars, gas engine lubricants, and nonflammable hydraulic system development for aerospace. Also discussed are: synthesis and properties of adamantine synthetic lubricants, lubrication and cooling in electricity generating plants, industrial applications of synthetic lubricants, waste treatability of aqueous-based synthetic metalworking fluids, characteristics of synthetic lubricating greases, shell fire-resistant grease, synthetic protective lubricants, experience with lead-free gear oils, properties and applications of perfluoropolyether lubricants, spreading of perfluorinated fluids on metal surfaces, and oxidation and inhibition of pentaerythritol esters. The 1-Diorganooxyphosphonyl)methyl] -2,4- and -2,6-dinitro- and diamino benzenes are prepared by nitrating an (organophosphonyl)methyl benezene to produce the dinitro compounds which are then reduced to the diamino compounds. The organo groups (alkyl, haloalkyl, aryl) on the phosphorus may be removed to give the free acids (HO)2P(=O)-. The diamino compounds may be polymerized with dianhydrides or diacyl halides to produce fire and flame resistant polymers which are useful in the manufacture of aircraft structures. NASA

**STRENGTH OF GRAPHITE/EPOXY BOLTED WING-SKIN SPLICE SPECIMENS SUBJECTED TO OUTDOOR EXPOSURE UNDER CONSTANT LOAD AND YEARLY FATIGUE LOADING**

G. R. WICHOREK and J. H. CREWS, JR. 1986 35 p refs
(NASA-TP-2542; L-16065; NAS 1.60:2542) Avail: NTIS HC
A03/MF A01 CSCL 11D

The results of an experimental study to provide long-term durability data on detailed full-scale graphite/epoxy wing-skin joint designs under environmental exposure and cyclic loading associated with commercial transport aircraft are reported. The specimens consisted of a single-row bolt configuration fabricated from T300/5208 and a double-row bolt configuration fabricated from T300/5209. The unpainted specimens were exposed to the outdoor environment under a sustained tensile load, and at yearly intervals, they were subjected to fatigue loading. Experimental results showed a slight reduction in residual tensile strength for both graphite/epoxy joints under the exposure times and fatigue loadings reported. A 7.5-percent decrease in residual strength was observed for the T300/5208 single-row joint after 5 years exposure and two lifetimes of fatigue loading. A 5.3-percent decrease in residual strength was observed for the T300/5209 double-row joint after 7 years exposure and 2.8 lifetimes of fatigue loading. The 5208 epoxy material was more susceptible to degradation by ultraviolet radiation than the 5209 epoxy material. Author

This report deals with fuel property effects on gas turbine engine combustors. In order to increase jet fuel availability and decrease cost, the Air Force is investigating alternate feedstocks such as tar sands, shale oils, heavy oils, and coal derived fuels. As these lower quality feedstocks begin to play a major role as sources of military jet fuels, it becomes increasingly important to be able to evaluate the effects of these fuels on engine life and performance. These effects have usually been measured using expensive and time-consuming engine tests. Of major concern in each of these programs was the effects of fuel properties and composition on soot formation, and the effects of soot on engine performance and durability. Being able to predict the change in soot formation due to changing fuel properties would be an invaluable tool in future research and development efforts to eliminate soot formation and its deleterious effects on engines. The reduction in exhaust plume, through reduced soot formation, reduces a vehicle's visibility for tracking and targeting purposes, thus increasing its survivability. It was concluded that smoke and combustion linear radiative heating correlate well with hydrogen content. That hydrogen content is as effective as any parameter at predicting soot formation; and the questioning of the validity of the data, and the need for more and better data. GRA

CSCL 11B

Vinyl pyridines including vinyl stilbazole materials and vinyl styrylpyridine oligomer materials are disclosed. These vinylpyridines form copolymers with bismaleimides which copolymers have good fire retardancy and decreased brittleness. The cure temperatures of the copolymers are substantially below the cure temperatures of the bismaleimides alone. Reinforced composites made from the cured copolymers are disclosed as well.

The present invention pertains generally to electroactive materials and in particular to electroactive organic ladder polymers. The electrical properties of organic polymers have attracted a great deal of attention from the scientific and industrial communities. Conductive polymers would be useful for the production of light weight batteries for electric vehicles and for use in place of metallic conductors aboard aircraft, where weight is and important consideration. They may also prove useful where corrossion resistance is required. It is one object of this invention to obtain and organic ladder polymer with high electrical conductivity. It is a further object of this invention to obtain a conductive ladder polymer that is stable against both thermal and chemical degradation.

Phenothiazine Ladder Polymer, PTL (or di-chloro-PTL) was prepared by polycondensation of 2,5-diamino-1, 4-benzenedithiol with 2,5 dichloro (or 2,3,5,5-tetrachloro)-p-benzoquinone in polyphosphoric acid at 250 C. Phenoxazine Ladder Polymer, POL, was prepared from 2,5-dichloro-p-phylendiamine and 2,5-dihydroxy-p-benezoquinone under the same conditions as used for PTL synthesis. Di-chloro-POL and other derivatives can be made under a similar condition. These polymers conduct electricity. GRA

A computer analysis conducted by Exxon Research and Engineering Company and NASA used standard refinery planning methods to determine the optimum processing path within model refineries to achieve minimum cost for various product outputs. Crude feedstock types were combined and refinery configurations selected to create regional calculation models. Principal objectives were: to determine the effect of jet fuel quality variations on the maximum yield of jet fuel; to determine the effect of jet fuel quality variations on refining costs for regional models based on future supply and demand; and to determine, for the United States Air Force, the effect of changing from wide cut (naptha) to kerosene jet fuels on refining cost and production yield in the United States and Europe. (FAA/CT-85/7; FAA-84-03-F) Avail: NTIS HC A05/MF A01

A state of the art review on composite material fatigue/damage tolerance was conducted to investigate the literature for fatigue life prediction methodologies including stress based methodologies, strength degradation models, and damage growth models. A critical review was made of each methodology and its commensurate basic equations of importance. Experimental data were reviewed and the behavior of specimens was correlated with that of civil aircraft components. Six recognized methods for the non-destructive testing of fibrous composite materials were examined and the most effective methods identified. Author

The mechanical, corrosion, metallurgical and secondary fabricability properties of the superplasticity formable Supral alloy were evaluated to assess the amenability of these alloys to standard aircraft practices. Fracture and fatigue properties were evaluated through extensive testing of superplasticity formed parts and discs. The mechanical property test results meet Alcan/Superform claims provided that the microaviation is restricted to less than three percent of the volume. Research findings show that Supral 100, 150, and 220 are alloys suitable for aircraft use. Testing of shop manufacturing practices and welding techniques indicate that the Supral alloys are comparable to standard U.S. aluminum alloys. GRA

Aminophenoxycyclotriphosphazenes such as hexakis(4-aminophenoxy)cyclotriphosphazene and tris(4-aminophenoxy)-tris phenoxycyclotriphosphazene are used as curing agents for epoxy resins. These 1,2-epoxy resins are selected from di- or polyepoxide containing organic moieties of the formula (CH2-CHO-CH2)m-W-R-W-(CH2CH-CH2O)m where R is diphenyldimethylmethane, diphenylmethane, bis(dibromophenyl)dimethylmethane. W is a nitrogen or oxygen atom; and m is 1 when W is oxygen and 2 when W is nitrogen. The resins are cured thermally in stages at between about 110 to 135 C for between about 1 and 10 min, then at between about 175 to 185 C for between about 0.5 to 10 hr and post-cured at between about 215 and 235 C for between about 0.1 and 2 hr. These resins are useful for making fire resistant elevated temperature stable composites, laminates (e.g., graphite fiber or fiberglass), molded parts, and adhesives and structures, usually for aircraft secondary structures and for spacecraft construction. This study involves the development of C-13 nuclear resonance as an on-line detector for liquid chromatography (LC-C-13 NMR) for the chemical characterization of aviation fuels. The initial focus of this study was the development of a high sensitivity flow C-13 NMR probe. Since C-13 NMR sensitivity is of paramount concern, considerable effort during the first year was directed at new NMR probe designs. In particular, various toroid coil designs were examined. In addition, corresponding shim coils for correcting the main magnetic field (B sub 0) homogeneity were examined. Based on these initial probe design studies, an LC-C-13 NMR probe was built and flow C-13 NMR data was obtained for a limited number of samples. Author

**F100 FUEL SAMPLING ANALYSIS Final Technical Report, May 1983 - Apr. 1984**

L. Q. MAURICE Sep. 1985 136 p

(Contract AF PROJ. 3048)

(AD-A161667; AFWAL-TR-85-2045) Avail: NTIS HC A07/MF A01 CSCL 21D

Fuel pump cavitation problems experienced with the F100 engine used in the F-15/F-16 aircraft have led to an extensive fuel analysis program to identify fuel properties that might be contributing to fuel pump failures. This report analyzes the chemical and physical properties of twenty-one JP-4 fuel samples obtained from United States Air Force Bases. The fuels analyzed met specifications in all but a few isolated cases, and had no unusual properties. If the fuel used is causing fuel pump failure, it must be the result of a fuel property not being measured. The fuels are as good or better than the specification prescribes. It is concluded that the F100 fuel pump cavitation problems are most likely associated with the mechanical complexity built into the design, rather than the result of the fuel used. GRA

**THE THERMO-MECHANICAL PROCESSING DURING CLOSED DIE FORGING - A METHOD OF IMPROVING AERONAUTICAL MATERIALS [LE TRAITEMENT THERMOMECANIQUE PAR MATRICAGE - FACTEUR D'AUGMENTATION DES PERFORMANCES DES MATERIAUX AERONAUTIQUES]**

F. CHEVET and A. GAVART (Compagnie Francaise de Forges et Fonderies, Paris-la-Defense, France) (Colloque sur les Aciers et les Alliages Speciaux dans l'Aeronautique, 11th, Le Bourget, France, June 6, 1985) Materiaux et Techniques (ISSN 0032-6895), Oct.-Nov. 1985, p. 611-617. In English and French.

In closed die forging, the general aim of thermomechanical processing, which is to improve mechanical properties through the control of structure by hot working, is extended to the control of local strains; difficulties arise, however, in that closed die hot forming does not yield homogeneous strain throughout the volume of the metal being worked. The development of simulation techniques that can 'visioplastically' determine local strain at every location has accordingly been undertaken. These techniques have yielded the ability to forge aircraft gas turbine elements requiring precise structural contour control, such as superalloy gas turbine disks. These techniques may also be applied to titanium, steel, etc. O.C.

**RELIABLE NONDESTRUCTIVE TESTING - THE KEY TO USING WELDMENTS IN CRITICAL FIGHTER AIRCRAFT STRUCTURE**

R. J. LORD and P. J. RAMSEY (McDonnell Aircraft Co., St. Louis, MO) Materials Evaluation (ISSN 0025-5327), vol. 44, Feb. 1986, p. 209-214, 208. refs

A nondestructive testing (NDT) procedure was developed for the purpose of controlling the weld quality of electron beam welds in critical fighter aircraft structures subjected to complex load patterns. The weldment is inspected using liquid penetrant, ultrasonic, and X-ray techniques designed specifically for the part configuration. The primary considerations of the NDT are: (1) the importance of X-ray beam alignment for detection of lack of fusion, (2) the effect of surface finish on ultrasonic inspection, and (3) the importance of pickling prior to penetrant inspection. An X-ray technique for confirming proper alloy usage was developed, together with a unique X-ray beam alignment indicator and a special sound beam reflection mirror to facilitate the X-ray and ultrasonic inspections. I.S.

**EFFICIENT IDENTIFICATION OF CRITICAL STRESSES IN STRUCTURES SUBJECT TO DYNAMIC LOADS**

R. T. HAFTKA, L. T. WATSON (Virginia Polytechnic Institute and State University, Blacksburg), and R. V. GRANDHI Computers and Structures (ISSN 0045-7949), vol. 22, no. 3, 1986, p. 373-386. refs

(Contract NAG1-224; NSF MCS-82-07217)

Optimum structural design problems generally employ constraints which are parametric in terms of space and time variables. A parametric constraint may be replaced by equivalent critical point constraints at its local minima for optimization applications. In complex structures, accurate identification of such critical points is computationally expensive due to the cost of finite element analyses. Three techniques are described for efficiently and accurately identifying critical points for space- and time-dependent parametric constraints. An adaptive search technique and a spline interpolation technique are developed for exactly known response. A least squares spline approximation is suggested for noisy behavior. A helicopter tail-boom structure subjected to transient loading is used as an example to demonstrate the techniques described. All three techniques are shown to be computationally efficient for critical point identification and the least squares approximation also removes noise from the data. The case of multiple constraints per element is shown to be particularly suited to the use of spline techniques. Author

**COMBINED EXPERIMENTAL/ANALYTICAL MODELING OF DYNAMIC STRUCTURAL SYSTEMS; PROCEEDINGS OF THE JOINT MECHANICS CONFERENCE, ALBUQUERQUE, NM, JUNE 24-26, 1985**

D. R. MARTINEZ, ED. and A. K. MILLER, ED. (Sandia National Laboratories, Albuquerque, NM) Conference sponsored by ASCE and ASME. New York, American Society of Mechanical Engineers , 1985, 235 p. For individual items see A86-26877 to A86-26885.

It is pointed out that modern structural analysis involves the use of both analytical and experimental techniques. The presented papers have the objective to report the state-of-the-art in combined experimental/analytical modeling, including the substructure synthesis techniques and experimental procedures required to apply these techniques in practical applications. An overview of analytical synthesis techniques is provided, taking into account a review of the time-domain and frequency-domain component mode synthesis method. In connection with an overview of modal testing and measurement, modal test requirements for coupled structure analysis using experimentally-derived component models are examined along with excitation, measurement, and analysis methods for model testing. Hybrid experimental/analytical dynamic models of aerospace structures are considered, and structural analysis model validation using modal test data is discussed. A description of case histories and applications is also given. G.R.

### EXPERIMENTAL SYSTEM IDENTIFICATION FOR EXPERIMENTAL/ANALYTICAL CORRELATION AND MODELLING

N. NIEDBAL (DFVLR, Institut fuer Aeroelastik, Goettingen, West Germany) IN: Combined experimental/analytical modeling of dynamic structural systems; Proceedings of the Joint Mechanics Conference, Albuquerque, NM, June 24-26, 1985 . New York, American Society of Mechanical Engineers, 1985, p. 195-204. refs

The dynamic qualification of spacecraft structures is considered, taking into account the use of modal survey tests to verify normal mode parameters. A survey is conducted of the state of the art of the classical sine-dwell methods and of some experimental modal analysis methods. The advantage of the new methods is that appropriated exciter forces, in the sense of the sine-dwell method are unnecessary. It is pointed out that in Europe the classical sine-dwell method is preferred to measure the normal mode parameters of the undamped structure for correlation and modelling of experimental and analytical results. Because of its superior flexibility, the model survey test concept is expected to attract increasing interest for purposes of dynamic qualification of future spacecraft structures. G.R.

### RELIABILITY AND FAILURE PREVENTION THROUGH ESA IN THE 80'S AND BEYOND

S. R. KATZ (Measurements Group, Inc., Raleigh, NC) IN: Failure prevention and reliability - 1985; Proceedings of the Conference, Cincinnati, OH, September 10-13, 1985 . New York, American Society of Mechanical Engineers, 1985, p. 123-126.

Experimental stress analysis (ESA) involves the measurement of strains due to the stresses to which a structure or element is subjected, and is applied where there is a risk of structural failure in service. Practical ESA techniques fall into the two broad categories of electronic and optical methods. Strain gage technology, which exemplifies the former category, has been extensively used in the aircraft industry to record the behavior of structural elements under stress. Optical ESA methods include photoelastic coatings and models that operate on the basis of patterns generated by polarized light. O.C.

### ENERGY DISSIPATION CONNECTED WITH VIBRATIONS OF MECHANICAL SYSTEMS [RASSEIANIE ENERGII PRI KOLEBANIIAKH MEKHANICHESKIKH SISTEM]

G. S. PISARENKO, ED. Kiev, Izdatel'stvo Naukova Dumka, 1985, 312 p. In Russian. For individual items see A86-27077 to A86-27086.

Results of analytical and experimental studies of the vibrations of various elastic systems under both steady-state and transient conditions are presented, with particular attention given to the effect of energy dissipation. Topics discussed include dissipative properties of cyclically deformed materials, vibrations of machine parts and components, and aerodynamic damping of the vibrations of various mechanical systems. In particular, papers are presented on the nonlinear vibrations of rectangular plates with allowance for energy dissipation; vibrations of shells of imperfectly elastic materials with allowance for geometrical nonlinearity; mathematical models for studying aircraft vibrations with allowance for structural hysteresis; and the effect of a periodic aerodynamic load on the dynamic stress level of the rotor blades of a turbomachine. V.L.

### THE PARALLEL-PLATE AND RHOMBIC EMP SIMULATORS - A SUMMARIZING REVIEW

R. W. P. KING (Harvard University, Cambridge, MA) IN: International Symposium on Electromagnetic Compatibility, Wakefield, MA, August 20-22, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 381-384. refs

Tests of the vulnerablity of aircraft and missiles to electromagnetic pulses (EMP) similar to those emanating from a nuclear explosion in the atmosphere are being conducted with the aid of large parallel-plate structures with tapered input and output ends. Thms paper provides a final report of research conducted regarding the employed EMP simulators. The induced surface currents on obstacles are considered along with CW operation of the metal-plate simulator, CW operation of a rhombic simulator, the rhombic simulator under pulse excitation, an experimental study of the metal-plate simulator, supplementary studies, and aspects of simulator-obstacle interaction. G.R.

**A86-27151**

### METHODOLOGY FOR DETERMINATION OF CIRCUIT SAFETY MARGINS FOR MIL-E-6051 EMC SYSTEM TEST

G. LEE and S. D. ELLERSICK (Boeing Military Airplane Co., Seattle, WA) IN: International Symposium on Electromagnetic Compatibility, Wakefield, MA, August 20-22, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 502-510. refs

(Contract F33657-81-C-0212)

The MIL-E-6051 electromagnetic compatibility (EMC) system test is concerned with the establishment of safety margins for avionics mission critical circuits. The safety margin (SM) of a circuit is the comparison of the circuit thereshold to the electromagnetic (EM) energy coupled into that circuit. In the case of the B-1B Avionics system certain difficulties were related to the complexity of the system with over 100 subsystem elements called line replaceable units (LRUs). A description is provided of the approaches taken and the analyses performed in selection of B-1B Avionics mission critical circuits to be sensitized or instrumented for test. Attention is given to aspects of methodology, mission critical LRU identification, interface circuit identification, circuit analysis, and wire-to-wire coupling analysis. G.R.

**A86-27157**

### AN OVERVIEW OF THE INTRASYSTEM EMC ANALYSIS PROGRAM WITH GRAPHICS

G. L. BROCK, T. L. BEDFORD, and G. M. GRANGE (Kaman Sciences Corp., Colorado Springs, CO) IN: International Symposium on Electromagnetic Compatibility, Wakefield, MA, August 20-22, 1985, Record . New York, Institute of Electrical and Electronics Engineers, 1985, p. 585-592.

The Intrasystem Electromagnetic Compatibility Analysis Program (IEMCAP) represents a computer program which was designed to perform EMC analyses of ground, aircraft, spacecraft, and missile systems. A number of improvements for IEMCAP are discussed. The resulting analysis tool with improved capabilities is called the Intrasystem Electromagnetic Compatibility Analysis Program with Graphics (IEMCAP-G). It is pointed out that the improvements help the EMC engineer in evaluating a system for compatibility. Thus, matrices, antenna plots, and line graphs make it possible to tell at a glance the severity of the potential EMI problems. Attention is given to an IEMCAP overview, available options for positive electromagnetive interference (EMI) point margins, detailed interference matrices, the extraction of data, geometry graphics, antenna position graphics, antenna gain patterns, line plots, and an analysis culling technique. G.R.

**A86-27203**

### ENGINEER'S GUIDE TO TITANIUM CASTINGS

R.H. COLLEY IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 1 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 151-156.

The main features of the Engineer's Guide to Titanium Castings are summarized. The Guide was developed to supply the essential data for cost-effective designs with Ti alloys. The Guide delineates the special properties of molten Ti in casting processes, particularly the high reactivity of Ti with other elements. Centrifuged molds and investment shell molds and their applications are described, along with the criteria which should be considered when judging whether or not to go to a cast Ti part instead of a wrought part. Design principles to avoid porosity, tooling complexity and shrinkage cavities are reviewed. Minimal stress values are provided for cast Ti alloys (Ti-6Al-4V), and factors to assess when comparing the costs of Ti alloys, which have long lifetimes, with other materials are discussed. M.S.K.

**A86-27204**

### TITANIIUM INVESTMENT CASTING - PRODUCTION, PROPERTIES AND APPLICATIONS

CH. LIESNER (Titan-Aluminum-Feinguss GmbH, Bestwig, West Germany) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 1 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 157-162. refs

Ti alloy casting techniques, repair welding of castings, and areas of applications are discussed. Investment casting by the lost wax method represents a cost savings compared to machining. Ti alloys are preferred for highly stressed aircraft parts, impellers and medical implants. Melting is performed in one of two ways for casting: in electron beam furnaces or in a vacuum arc furnace with a consumable electrode. The latter method offers superior heat distribution and less evaporative loss of alloy elements. Casts are lined with resin-bound graphite, thermodynamic high solid oxides/oxide binders such as ThO2, Y2O3 or CaO, or high melting metals/oxide binders to prevent the intrusion of liner material into the surface of the cast part. Gas holes are prevented by centrifuging the cast with the melt in it. Weld repairs to fractured parts have exhibited mechanical properties similar to the parent material. Cast Ti alloy parts find their greatest applications where a high mechanical strength/specific gravity ratio or a high solidity/low specific gravity ratio is required. Author

**A86-27211**

### RECYCLING OF TITANIUM SCRAP FOR THE PRODUCTION OF HIGH-DUTY AEROSPACE COMPONENTS

H. JAEGER, J. MAYERHOFER, R. TARMANN, J. NEUHOLD, and J. FLADISCHER (Vereinigte Edelstahlwerke AGA, Kapfenberg, Austria) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 1 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 257-264. refs

The production of Ti for aerospace applications can consume up to 50 MWh for a ton of Ti ingot, while machining practices can leave up to 90 percent of the original metal as scrap. Recyling reduces the costs of Ti feedstock, and accounts for 30 percent of all Ti used in the U.S. The non-consumable arc furnace (NAF) offers several advantages for recycling operations when compared with the consumable melting furnace (CMF). The benefits include ingots that are 100 percent scrap, control of the loss of alloying trace elements, tailored heating of the melt and no combustibles in the furnace. NAF plants are more expensive than CMF operations, and feature either a skull melting procedure or use of a ceramic-lined crucible. Both methods require a power input of 4.4 MW for a melting rate of 500-600 kg/hr at pressures of 50-100 Pa. The scrap is cut up, pickled and sandblasted, then inspected visually to remove casting, instead of milling or machining, of high performance Ti alloy components of jet aircraft is being developed as an acceptable forming technique which has a significantly lower scrap generation rate. M.S.K.

### TEN YEARS OF FRONT-FAN BLADE FORGING

O. VOIGTLAENDER and G. GUENTHER (Thyssen Schmiedetechnik, Remscheid, West Germany) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 1 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 477-481. refs

The drop forge processes employed to shape the front turbofan blades for the RB 211-554 engine are described. About 70,000 of the blades have been delivered since the beginning of the 1970s, each designed to withstand a tangential speed of Mach 1.4 and 780 KN force at the root. The blades were designed using CAD techniques which helped define a die shape that accounted for heat shrinkage, the distribution of contact stresses at the die interface, the elastic contact strains of the die and the mass distributions for preform, intermediate and finish forged shapes. Drop forging is used to alter a rod of machined material into the blade shape after successive twisting and coining operations to produce the desired shape. The transformation stages are balanced to ensure a smooth grain flow along the blade contour. M.S.K.

### ISOTHERMAL FORGING SYSTEM FOR THE PRODUCTION OF LARGE ROTATING COMPONENTS FROM TITANIUM ALLOYS OR SUPERALLOYS

F. HUGO (Leybold-Heraeus Technologies, Inc., Enfield, CT), A. HENN, R. DEBES, D. SCHWARZ, F. ANDERLE (Leybold-Heraeus GmbH, Hanau, West Germany) et al. IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 2 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 741-744.

**A86-27272**

### PRODUCIBILITY OF AIRCRAFT STRUCTURAL PARTS BY SUPERPLASTIC FORMING AND DIFFUSION BONDING

R. HOLBEIN and K.-F. SAHM (Dornier GmbH, Friedrichshafen, West Germany) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 2 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 1237-1244. refs

Weight and cost reduction assessments are made for a variety of aircraft structural components fabricated by superplastic forming/diffusion bonding (SPF/DB) of Ti alloys, with attention to component development management on the basis of experimental efforts. Two-, three-, and four- sheet (as well as single-sheet) basic structural forms from which aircraft structural elements can be compounded by SPF/DB are discussed, and fin, engine mount and fire wall structures produced by these means are evaluated. O.C.

**A86-27278**

### EB REPAIR WELDING OF A CRITICAL AIRCRAFTPART MADE FROM THE NONWELDABLE TITANIUM ALLOY 3.7184.7 (TI-AL4-MO4-SN2-SI)

G. NEYE and A. KOLLEY (Messerschmitt-Boelkow-Blohm GmbH, Bremen, West Germany) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 2 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 1291-1298. refs

Attention is given to the electron beam welding-based repair method used for the Ti alloy flap carriage torsion cell of the A300 airliner, which cost only about 28 percent as much as the fabrication of a new component. Electron beam welding yielded no distortion due to thermal loads, and no embrittlement of the weld area due to gas absorption. It is noted that such welding-based repair operations make possible the restoration of defective or damaged items for unrestricted subsequent use, at economical cost. O.C.

**FRETTING FATIGUE TESTING WITH A FRETTING BRIDGE EQUIPMENT STRESS ANALYSIS, AMPLITUDES OF SLIP, RELIABILITY**

E. BROSZEIT, K. H. KLOOS, and B. O. SCHWEIGHOEFER (Darmstadt, Technische Hochschule, West Germany) IN: Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volume 4 . Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1985, p. 2179-2186.

In aircraft engines, titanium alloys are used as material for turbine blades in the fan area, on the basis of weight considerations. In such cases, fretting can lead to macrocracks which represent serious component defects. The present paper is concerned with a study of the fretting fatigue behavior of the alloy Ti-6Al-4V with the aid of a model apparatus. The approach employed in the study is based on the fretting bridge test principle. Attention is given to the fretting bridge arrangement, typical damage observed in the case of a specimen fractured in a fretting fatigue test, and the significance of the stress distribution in the system of specimen and fretting bridge. The investigation of the stress and slip distribution in the contact system specimen-fretting bridge is discussed, taking into account the finite element structure and stress distribution, the stress profile in the contact area of specimen and fretting bridge during a cycle of load, the distribution of slip between specimen and fretting bridge, and the material stressing in the contact area. G.R.

**NOISE IMMUNITY OF SIGNALS WITH MINIMUM FSK [POMEKHOUSTOICHIVOST' SIGNALOV S MINIMAL'NOI CHASTOTNOI MANIPULIATSIEI]**

A. I. LOGVIN and S. V. NEBUSEV Radiotekhnika (ISSN 0033-8486), Jan. 1986, p. 49-54. In Russian. refs

The Markov theory of optimal nonlinear filtering is used to synthesize a receiver scheme for minimum-FSK signals with random changes of the HF phase and signal delay. Formulas for estimating the noise immunity of the synthesized scheme are presented, and numerical-integration results are given. It is noted that the proposed scheme is suitable for satellite and aircraft communications systems. B.J.

**A86-27653#**

**A STUDY OF THE STATIC POST BUCKLING BEHAVIOR OF COMPOSITE SANDWICH PLATES**

S. HANAGUD, H. P. CHEN, and P. SRIRAM (Georgia Institute of Technology, Atlanta) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 13 p. refs

A static post buckling behavior of composite sandwich plates has been analyzed in this paper. A consistent and general three dimensional approach to the formulation has been presented. Finite deformations have been considered and a total Lagrangian approach has been used. Numerical solutions have been obtained by a discrete penalty function based finite element technique. A constant arc-length method has been used for equilibrium iterations to achieve faster convergence needed in post buckling studies. Author

**MECHANICAL DESIGN AND EVALUATION OF A SLOTTED CFRP WAVEGUIDE ANTENNA**

L. KNUTSSON, S. BRUNZELL, and H. MAGNUSSON (Ericsson Radio Systems, AB, Moelndal, Sweden) IN: ICCM - V; Proceedings of the Fifth International Conference on Composite Materials, San Diego, CA, July 29-August 1, 1985 . Warrendale, PA, Metallurgical Society, Inc., 1985, p. 475-481.

A development program for a slotted waveguide array antenna made of metallized CFRP was carried out. The main objective was to minimize the weight of the structure without degrading the electrical and mechanical performance. This paper focuses on mechanical design aspects and manufacturing methods of metallized CFRP waveguides and assembly of an antenna array. A weight saving of approximately 40 percent was accomplished by the CFRP structure compared to a corresponding aluminum structure. Electrical properties and cost were essentially equal for the two concepts. Author

**AEROELASTIC TAILORING STUDY IN AIRCRAFT DESIGN**

T. UGAI, H. KIKUKAWA, J. TAKAKI (Fuji Heavy Industries, Ltd., Utsunomiya, Japan), M. SUNAKAWA, and Y. HIRANO (Tokyo, University, Japan) IN: ICCM - V; Proceedings of the Fifth International Conference on Composite Materials, San Diego, CA, July 29-August 1, 1985 . Warrendale, PA, Metallurgical Society, Inc., 1985, p. 1221-1232. Research sponsored by the Agency of Industrial Science and Technology.

A computer program to assist the tailoring of aeroelastic composite aircraft wing designs, the Composite Structure Multi-constrained Optimization System (COSMOS), is described. The program makes it possible to perform automatically repeated calculations of design constraints with respect to composite strength, deflection, flutter velocity, and vibration frequency. The main objective of the COSMOS program is the optimization of composite laminated structures, but the optimization of metal structures is also possible. In addition to the four main optimization criteria provided by COSMOS, future constraints on buckling, thermal stress, and fatigue will be incorporated in the future. In order to correlate the design constraints of the COSMOS program, a test prototype laminate structure was built and rigidity and vibration tests were carried out. The test results for strain and twist angle of the model structure are compared with COSMOS estimates in a table. I.H.

**STRUCTURAL IMPACT AND CRASHWORTHINESS; PROCEEDINGS OF THE INTERNATIONAL CONFERENCE, IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY, LONDON, ENGLAND, JULY 16-20, 1984. VOLUME 1 KEYNOTE LECTURES. VOLUME 2 - CONFERENCE PAPERS**

G. A. O. DAVIES, ED. and J. MORTON, ED. (Imperial College of Science and Technology, London, England) Conference sponsored by USAF, U.S. Army, Westland Helicopters, Ltd., and Imperial College of Science and Technology. London and New York, Elsevier Applied Science Publishers, 1984. Vol. 1, 269 p.; vol. 2, 578 p. No individual items are abstracted in these volumes.

In the present treatment, 'crashworthiness' is understood to mean the ability of land, sea and air vehicles to survive collision without unacceptable damage to payloads; the problem is therefore one of low-to-moderate velocity, and the amount of energy to be absorbed is a major parameter. 'Structural impact' is construed, however, as a more general term, encompassing many cases of high or low velocity impact between objects that may be vehicles, projectiles, ground installations, body armor, etc. Among the topics discussed are NASA research on crash dynamics, the scaling of inelastic structures, vehicle impacts and fire hazards, ballistic deformation, and impact and crashworthiness of composite structures. Also treated are topics in automobile and rail transport, concrete structures, aircraft impacts, fluid-structure interaction, composites, energy absorption, and blast and ballistic effects. O.C.

**PROBLEMS OF AIRCRAFT RELIABILITY [PROBLEMY NADEZHNOSTI LETATEL'NYKH APPARATOV]**

I. F. OBRAZTSOV, ED. and A. S. VOLMIR, ED. Moscow, Izdatel'stvo Mashinostroenie, 1985, 280 p. In Russian. For individual items see A86-28304 to A86-28322.

The papers presented in this volume provide an overview of current theoretical and experimental research in the field of aircraft reliability. Topics discussed include accelerated testing as a means of ensuring the reliability of aircraft equipment, reliability and maintenance of aircraft, optimum maintenance of aircraft systems on the basis of their condition with allowance for measurement errors, and deterministic and statistical models of durability. Papers are also presented on problems in the dynamics of aircraft structures exposed to intensive acoustic loading, optimal frequency of the periodic tests of on-board digital computers, and a combined optimal algorithm for filtering and calculating navigation coordinates. V.L.

**RELIABILITY AND MAINTENANCE OF AIRCRAFT [NADEZHNOST' I TEKHNICHESKAIA EKSPLUATATSIIA AVIATSIONNOI TEKHNIKI]**

V. V. FILIPPOV IN: Problems in aircraft reliability . Moscow, Izdatel'stvo Mashinostroenie, 1985, p. 48-62. In Russian. refs

The relationship between the reliability of aircraft systems and the approach to their maintenance is examined, and various maintenance strategies are discussed. In particular, attention is given to maintenance programs based on the remaining life criterion, on the actual condition of the equipment, and on the level of reliability. The problem of determining the optimum periodicity of maintenance is also discussed. V.L.

**A86-28314**

**RELIABILITY OF THE PLATES AND SHELLS OF AIRCRAFT [NADEZHNOST' PLASTINOK I OBOLOCHEK LETATEL'NYKH APPARATOV]**

A. S. VOLMIR and S. A. TIMASHEV IN: Problems in aircraft reliability . Moscow, Izdatel'stvo Mashinostroenie, 1985, p. 151-170. In Russian.

The reliability of the plate and shell structures of aircraft that are subjected during service to various types of loading, including axial compression, torque, and transverse loading, is investigated using a systems approach. The principal schemes for calculating the reliability of deformable systems are presented, and ways to control the reliability of mechanical systems are discussed. Particular attention is given to cases involving a decrease in the cross-sectional area of thin-walled aircraft structures or a deterioration of the physicomechanical properties of a structural material during service. V.L.

**APPLYING I. G. BUBNOV'S METHOD TO THE SOLUTION OF THE NATURAL VIBRATION PROBLEM FOR A CONICAL SANDWICH PANEL [PRIMENENIE METODA I. G. BUBNOVA K RESHENIIU ZADACHI O SVOBODNYKH KOLEBANIIAKH TREKHSLOINOI KONICHESKOI PANELI]**

E. I. GRIGOLIUK and E. A. LOPANITSYN IN: Problems in aircraft reliability . Moscow, Izdatel'stvo Mashinostroenie, 1985, p. 171-187. In Russian. refs

A direct variational approach is proposed for solving a problem concerning the natural vibrations of a conical sandwich panel with a stiff core loaded in shear. The eigenvalue problem is solved through simultaneous iteration; the convergence of the method is evaluated. V.L.

**A86-28316**

**PROBLEMS IN THE DYNAMICS OF AIRCRAFT STRUCTURES EXPOSED TO INTENSIVE ACOUSTIC LOADING [ZADACHI DINAMIKI KONSTRUKTSII LETATEL'NYKH APPARATOV PRI INTENSIVNYKH AKUSTICHESKIKH VOZDEISTVIIAKH]**

A. V. KARMISHIN and I. G. KILDIBEKOV IN: Problems in aircraft reliability . Moscow, Izdatel'stvo Mashinostroenie, 1985, p. 188-203. In Russian. refs

The current theoretical and experimental research related to the strength of aircraft structures subjected to acoustic loading is briefly reviewed. In particular, attention is given to characteristics of the behavior of thin-walled structural elements under intensive acoustic loading, nonlinear characteristics of panels, and the effect of acoustic loading on the fatigue life and the bearing capacity of structural elements. The importance of considering acoustic loading in evaluating the reliability of aircraft structures is emphasized. V.L.

**A86-28318**

**DYNAMIC STABILITY OF ELASTIC STRUCTURES UNDER RANDOM INFLUENCES [DINAMICHESKAIA USTOICHIVOST' UPRUGIKH KONSTRUKTSII PRI SLUCHAINYKH VOZDEISTVIIAKH]**

B. P. MAKAROV IN: Problems in aircraft reliability . Moscow, Izdatel'stvo Mashinostroenie, 1985, p. 223-235. In Russian. refs

The paper is concerned with problems of the stability and stochastic parametric oscillations of elastic structures that are represented as discrete systems. In particular, the spectra of the critical parameters are analyzed for the case of wide-band and narrow-band effects, and their asymptotic properties are determined. The flutter of a panel in the presence of fluctuations is analyzed as an example. V.L.

**A86-28319**

**THE LIFE OF REINFORCED THIN-WALLED STRUCTURES IN A RANDOM FORCE FIELD [DOLGOVECHNOST' TONKOSTENNYKH PODKREPLENNYKH KONSTRUKTSII V POLE SLUCHAINYKH SIL]**

V. N. MOSKALENKO IN: Problems in aircraft reliability . Moscow, Izdatel'stvo Mashinostroenie, 1985, p. 236-245. In Russian.

Solutions are presented for problems of the natural vibrations of periodic and quasi-periodic systems in gas flow, as well as problems concerned with the determination of the life of reinforced structures. The properties of the frequency spectra and of the modes of the natural vibrations of periodic and quasi-periodic systems are discussed. It is noted that excitation generally occurs at the frequencies corresponding to the pass band of the elastic skin and at the frequencies corresponding to the preferred vibrations of the acoustic volume. V.L.

**A86-28321**

**PROBLEMS IN THE STABILITY AND DYNAMICS OF AIRCRAFT STRUCTURES WITH PHYSICOMECHANICAL SINGULARITIES [ZADACHI USTOICHIVOSTI I DINAMIKI ELEMENTOV LETATEL'NYKH APPARATOV S FIZIKO-MEKHANICHESKIMI OSOBENNOSTIAMI]**

I. N. PREOBRAZHENSKII IN: Problems in aircraft reliability . Moscow, Izdatel'stvo Mashinostroenie, 1985, p. 252-262. In Russian.

A method for solving stability problems for stiffened structures is proposed which is based on the formalism of generalized, or impulsive functions. The method is illustrated for a hinged stiffened cylindrical panel with a damaged stiffening element and for a stiffened cylindrical shell. It is shown that in certain cases, the inhomogeneity of the stressed state due to a damage can be neglected in the general stability analysis of a structure. V.L.

**A86-28322**

**THE EFFECT OF CHANGES IN THE STATIC STRENGTH OF A STRUCTURE DURING SERVICE ON THE RELIABILITY OF AIRCRAFT [VLIIANIE IZMENENIIA STATICHESKOI PROCHNOSTI KONSTRUKTSII V PROTSESSE EKSPLUATATSII NA NADEZHNOST' LETATEL'NYKH APPARATOV]**

O. I. TEREBUSHKO IN: Problems in aircraft reliability . Moscow, Izdatel'stvo Mashinostroenie, 1985, p. 262-270. In Russian.

An approximate method is proposed for evaluating the effect of changes in the static strength of a structure during service on its reliability. Numerical calculations are presented which show that even a relatively small reduction in static strength can multiply the probability of failure. The effect of the variance coefficients of the initial strength and safety on the reliability is illustrated by examples. V.L.

**A86-28330**

### A FLEXIBLE PROGRAMMABLE SIGNAL PROCESSOR FOR NEXT GENERATION FIGHTER AIRCRAFT

R. ROWLETT, C. STEWART, and M. MAYOR (Sperry Corporate Technology Center, Reston, VA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 22-27. refs

The performance requirements of next generation Programmable Signal Processors (PSP) military radar applications are examined. Consideration is given to processor performance criteria (throughput rate, parameter changes, mode changes) in connection with several air-to-air radar modes including long range search, single target tracking, track-while-scan, and ECCM. Air-to-ground radar modes are also examined, with emphasis given to Moving Target Indication (MTI), Doppler mode, SAR, and terrain following/avoidance. It is shown that next-generation PSP will require processing speeds on the order of 1 billion complex operations per second. It is pointed out that conventional array processor architectures similar to those in current PSPs will need significantly larger memory bandwidths to achieve the required throughput rates. However, the use of parallel architectures such as systolic arrays and wavefront arrays can achieve such speeds with much lower memory bandwidth requirements. I.H.

**A86-28332**

### DIGITAL CHIRP DEMODULATION

C. F. ANDREN and M. A. KOMARA (Harris Corp., Melbourne, FL) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 35-40.

The results of computer simulations of process of the digital chirp demodulation are presented. It is shown that digital chirp demodulation can be accomplished using 4-bit signal quantization provided that Gaussian-distributed dither is injected 15 dB below the full-scale level of the quantizer. Comparative results obtained with ramp-type dither showed unacceptable performance, as well as those using less than 4 bits of quantization and more or less dither. Functional block diagrams of analog and digital chirp demodulation processes are provided. I.H.

**A86-28338**

### FIBER OPTIC HIGH SPEED DATA BUS

R. MONING and G. HILL (Boeing Military Airplane Co., Wichita, KS) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 88-90.

R&D activity is discussed in connection with a fiber optic data bus architecture having 48 channels for transmission of 64 Kbps PCM voice data. The system consists of three remote terminals, a gateway terminal, and a 4-port star-coupled fiber optic data bus. Each terminal consists of an 8086 processor card which controls the terminal or gateway; a digital-to-analog converter; and an interface card which controls the fiber optic data bus. The data bus protocol for the system is described and a detailed schematic diagram of the protocol initialization sequence is provided. I.H.

**A86-28340**

### IMAGING CONNECTOR INTERCONNECT SYSTEM FOR A PARALLEL FIBER OPTIC DATA BUS

R. W. UHLHORN (Harris Corp., Government Aerospace Systems Div., Melbourne, FL) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 95-102. Research supported by the Harris Corporation Independent Research and Development Fund.

A fiber optic data transfer system capable of transmitting high-speed parallel digital data is being developed. This system is part of a total network concept, known as the Distributed Memory Network (DMN), which has numerous aerospace applications and is directly applicable to bus networking requirements specified in the Advanced Systems Avionics (ASA) baseline. The data transfer system, which utilizes a new optical imaging connector, a multi-fiber transmission medium, and highly reliable electronic and electro-optic components is the heart of the DMN. Because of the very high data rates involved in future avionics systems, fiber optics is the only viable transmission medium, and the connector concept is the only practical way of achieving the required high-speed, high-density parallel interface. The present design is capable of transmitting 64-bit parallel data at word rates up to 128 megawords per second for an equivalent serial data rate of 8.192 Gbps. Author

**A86-28341**

### A ROBUST 100 MBPS NETWORK FOR AVIONICS APPLICATIONS

M. P. VARGA (Sperry Corp., Space Systems Div., Phoenix, AZ) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 103-111.

A fiber-optic Local Area Network that operates at a transmission rate of 100 MBPS is designed to feature advantages of random access (contention) networks and deterministic (token) networks. This LAN implements a contention access protocol that dynamically adjusts its performance to that of a token network as the data traffic increases. The statistical relationship between collisions and data traffic load is used to achieve this adjustment in performance. The network and bus interface units (BIUs) incorporate message fault recovery, system statistical monitor, built-in test, low power, high reliability, and radiation resistant features. The network and BIUs were designed to incorporate redundancy with cross-strapping at the physical media, and because the media is a broadcast media with simultaneous transmission over both fiber buses, immediate recovery or many physical layer failures is possible. System level redundancy is supported with BIU internal checks and an automatic switchover to redundant units. Author

**A86-28342**

### HIGH SPEED FIBER OPTIC DATA BUS FOR AVIONICS INTEGRATION

P. R. COUCH and K. D. FERRIS (FiberCom, Inc., Roanoke, VA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 114-121.
(Contract F33615-83-C-1036)

A review of the state-of-the-art of the various elements of a fiber optic data bus has been conducted. Based on the characteristics of the various components, an analysis of data bus system performance in an avionics integration application was performed. Technology/performance limits of the fiber optic data bus elements were combined with the avionics integration requirements to define the tradeoffs between topology, data rate, and number of terminals. The study concluded that fiber optic technology has matured to the point that, optical data buses supporting up to 128 terminals are feasible at data rates up to 300 Mb/s and that such buses will be key to avionics integration with future VHSIC computers and avionic sensors. Author

**A86-28343**

### HIGH SPEED BUS FOR PAVE PILLAR APPLICATIONS

M. T. LUDVIGSON and K. L. MILTON (Rockwell International Corp., Collins Government Avionics Div., Cedar Rapids, IA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 122-129.

The status of development activity in connection with the USAF High Speed Bus Technology program is reviewed. Emphasis is given to wire bus designs with applications in Pave Pillar systems. The basic design requirements of a digital data bus are discussed with respect to optimum throughput rate; the optimum number of terminals; message length; and compatibility with fiber-optic media. Network topologies for the bus are described, with attention given to linear networks, active rings, and switched networks. Optimum protocols and message formats for the linear bus topology of the bus are discussed in detail. Functional block diagrams of the wire bus coupler, terminal, and control interfaces of the bus system are provided. I.H.

**A86-28344#**

### A DUAL CHANNEL HIGH SPEED FIBER OPTICS MULTIPLEX DATA BUS SYSTEM

H. J. ALBER and W. A. THOMAS (USAF, Systems Aeronautical Systems Div., Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 130-135.

This paper provides the framework for a candidate high speed data bus. The high speed data bus is intended for use with the next generation fighter and bomber aircraft. The bus system minimizes the transport delays, optimizes the efficiency of transporting data, and minimizes the control overhead. Manchester coding plus unique start and stop identifiers are used to minimize the complexity of the encoding and decoding electronics. The token passing and centralized bus management concepts provide a deterministic system that can rapidly respond to system faults. Fiber optic point-to-point links are used to minimize the risk in connector and transceiver development, while providing for a large number of users and relatively long distances between devices. ### CONTROL OF A HIGH-SPEED, BRUSHLESS DC MOTOR DRIVEN THROUGH A CYCLOCONVERTER LINE

J. J. CATHEY, D. B. REESOR (Kentucky, University, Lexington), and J. A. WEIMER (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 376-382. refs
(Contract F33615-81-C-201)

Feasibility and concept of designing a high-speed, permanent magnet, brushless dc motor aircraft fuel pump drive using a cycloconverter link is examined. Analytical methods are developed to model the behavior of a three-phase permanent magnetic machine when operated as a self-synchronous motor supplied from a polyphase, variable voltage, variable frequency source through a midpoint cycloconverter link under circulating current free mode of control. A hybrid combination of sinusoidal and dc steady-state analysis methods is utilized to obtain a suitable equivalent circuit of the motor. Study of the motor model is made to establish the nature of the no load MMF angle as a function of current to give a minimum value while assuring proper thyristor commutation. Then, a closed loop control system with an outer loop on speed and an inner loop on current is postulated wherein a proportional plus integral controller is placed in the forward path to assure minimum speed error. A numerical study of performance is presented for speed runup and rundown conditions. Author

### POWER THYRISTOR STARTER FOR AIRCRAFT ENGINE

Z. CAI (Purdue University, West Lafayette, IN) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 383-390.

A power thyristor starter for powerful aircraft engine is introduced. Some problems which appeared during the industrial testing are analyzed. The technology-economy indices of this device were verified by the experimental curves and by comparing with those of the internal-combustion engine-dc generator power-supply vehicle. Author

**A86-28376**

### MULTIVOLTAGE HIGH POWER ELECTRICAL POWER SYSTEM

W. E. HYVARINEN (Westinghouse Electric Corp., Pittsburgh, PA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 407-412.

Applications are being identified where the optimum aircraft electrical system may not be the conventional 400 Hz approach. The requirements for a multivoltage high power airborne electrical system are presented. The methodology used to define and evaluate operating parameters, system configuration and control philosophy are presented. The approach recommended for this application is described. Author

### IMPROVED RELIABILITY OF ELECTRONIC CIRCUITS THROUGH THE USE OF HEAT PIPES

A. BASIULIS and C. P. MINNING (Hughes Aircraft Co., Culver, City, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1244-1247.

The increase in power dissipation of new avionic circuits is applying ever higher demands on the ability of conventional cooling systems to maintain circuit temperatures at accepptable levels. Since the failure rate of an electronic component is strogly temperature dependent, the design of avionics systems is often times limited by thermal considerations. In a sidewall cooled avionics chassis such as that described in MIL-STD-XXX, temperatures of PWB mounted electronic components can be reduced significantly if heat pipes instead of solid metal plates are used to transport electronic-component generated heat to the cooled sidewalls. To demonstrate this results, experimental testing of heat pipe cooled PWBs was combined with thermal analysis to show that the mean time between failure (MTBF) of an advanced bulk memory can be increased by up to 60 percent if heat pipes are used in place of solid metal plates. ### DIAGNOSIS - USING AUTOMATIC TEST EQUIPMENT AND ARTIFICIAL INTELLIGENCE EXPERT SYSTEMS

J. E. RAMSEY, JR. (USAF, Institute of Technology, Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1369-1374. USAF-supported research.

Three expert systems (ATEOPS, ATEFEXPERS, and ATEFATLAS), which were created to direct automatic test equipment (ATE), are reviewed. The purpose of the project was to develop an expert system to troubleshoot the converter-programmer power supply card for the F-15 aircraft and have that expert system direct the automatic test equipment. Each expert system uses a different knowledge base or inference engine, basing the testing on the circuit schematic, test requirements document, or ATLAS code. Implementing generalized modules allows the expert systems to be used for any different unit under test. Using converted ATLAS to LISP code allows the expert system to direct any ATE using ATLAS. The constraint propagated frame system allows for the expansion of control by creating the ATLAS code, checking the code for good software engineering techniques, directing the ATE, and changing the test sequence as needed (planning). **CONTACT HEAT TRANSFER - THE LAST DECADE**

C. V. MADHUSUDANA (New South Wales, University, Kensington, Australia) and L. S. FLETCHER (Texas A&M University, College Station) AIAA Journal (ISSN 0001-1452), vol. 24, March 1986, p. 510-523. refs

Thermal contact conductance should be high in such applications as nuclear reactors, gas tubines, aircraft structural joints, etc.; when mechanically strong insulation is required, by contrast, as in the storage of cryogenic liquids, contact resistance must be as high as possible. Attention is presently given to the results obtained since 1970 by theoretical and experimental studies of conduction through contact spots and through interstitial materials. Special problems that are introduced by the geometry of contact, load cycling, and heat flux, are also discussed. Recommendations are made concerning the most fruitful directions for future investigation. O.C.

**MATERIAL CONTRAVARIANT COMPONENTS - VORTICITY TRANSPORT AND VORTEX THEOREMS**

L. MORINO (Boston University, MA) AIAA Journal (ISSN 0001-1452), vol. 24, March 1986, p. 526-528. refs
(Contract DAAG26-83-K-0050)

The concept of material contravariant components of the vorticity in a convected curvilinear coordinate system is introduced in order to interpret classical vortex theorems. For the case of inviscid isentropic flows, the material contravariant components of the vorticity divided by the density are constant, following a material point. This result simplifies the proof and the kinematic interpretation of classical results. The present result is then extended to general viscous nonisentropic flows, and used to obtain a simple but powerful computational scheme for the solution of Beltrami's vorticity equation. O.C.

**CRYOGENIC TUNNEL MEASUREMENT OF TOTAL TEMPERATURE AND PRESSURE**

W.-F. NG and J. C. ROSSON (Virginia Polytechnic Institute and State University, Blacksburg) Journal of Aircraft (ISSN 0021-8669), vol. 23, March 1986, p. 244-249. Research supported by George Washington University and NASA. refs

A newly developed, 3-mm-diam, dual hot-wire aspirating probe was used to measure the time-resolved stagnation temperature and pressure in a transonic cryogenic wind tunnel. Measurements were taken in the freestream of the settling chamber and test section. Data were also obtained in the unsteady wake shed from an airfoil oscillating at 5 Hz. The investigation revealed the presence of large fluctuations in the settling chamber occuring at the blade passing frequency of the driving fan of the tunnel. These fluctuations decrease at the test section. The rms value of the fluctuating stagnation pressure decreased from 17.5 percent in the settling chamber to 3.7 percent in the test section. Fluctuating stagnation temperature decreased from 12.3 percent to 8.4 percent. Measurements in the wake of the oscillating airfoil showed a fluctuating stagnation temperature of as much as 42 K in rms value. Author

**ADVANCES IN AEROSPACE STRUCTURAL ANALYSIS; PROCEEDINGS OF THE WINTER ANNUAL MEETING, MIAMI BEACH, FL, NOVEMBER 17-22, 1985**

O. H. BURNSIDE, ED. and C. H. PARR, ED. (Southwest Research Institute, San Antonio, TX) Meeting sponsored by ASME. New York, American Society of Mechanical Engineers , 1985, 152 p. For individual items see A86-28652 to A86-28663.

The present conference considers the uncertain eigenvalue analysis of composite laminated plates by stochastic FEM, probabilistic finite elements for transient analysis in nonlinear continua, the numerical synthesis of trivariate velocity realizations of turbulence, efficient algorithms applicable to probabilistic finite element analysis, a stochastic model for fatigue crack growth rate, and the demonstration of a novel fast probability integration method for reliability analysis. Also discussed are advanced reliability methods for structural evaluation, probabilistic structural analysis for spacecraft propulsion system components, the prediction of micromechanical properties in flexible matrix composites, the limitations of finite elements in orthotropic laminated beam analysis, a case study of cure cycle shrinkage deformations, and mixed finite element models for laminated composite plates. O.C.

**NUMERICAL SYNTHESIS OF TRI-VARIATE VELOCITY REALIZATIONS OF TURBULENCE**

P.-T. D. SPANOS (Rice University, Houston, TX) and K. P. SCHULTZ (Lockheed Engineering and Management Services Co., Houston, TX) IN: Advances in aerospace structural analysis; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 . New York, American Society of Mechanical Engineers, 1985, p. 25-35. refs
(Contract NAG3-210)

An approach for synthesizing trivariate turbulence velocity field spatial realizations is presented. Some of the spatial frequency characteristics of the random velocity field are described by the von Karman spectrum. The simulation algorithm is based on an efficient autoregressive-moving average (ARMA) scheme involving coefficient square matrices of order three. The determination of the efficient low order ARMA algorithm is preceded by the determination of a suitable high order autoregressive (AR) simulation algorithm. The numerical results are presented in a dimensionless form. Thus, they are applicable for any scale of turbulence. Author

**TAIL PROFILE EFFECTS ON UNSTEADY LARGE SCALE FLOW STRUCTURE IN THE WING AND PLATE JUNCTION**

E. P. ROOD and D. G. ANTHONY (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD) IN: Forum on unsteady flow - 1985; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 . New York, American Society of Mechanical Engineers, 1985, p. 30-32. Navy-sponsored research.

Mean velocity contours and flow separation patterns for two tail profiles, a 28 degree circular arc and an NACA 0020, are measured to determine the characteristics of the unsteady large scale flow structure associated with the wing and plate junction. Data indicate that the pressure recovery at the tail of the wing, immersed in the otherwise steady boundary layer, is especially significant in determining the downstream dynamic vortex-wake-boundary layer interaction. It is found that adverse pressure gradients produce rapid growth of the across-stream spatial extent of the vortex legs, and that vortex rollup, which contributes to the spatial extent of the unsteadiness of the vortex legs, is indicated by the curved separation line along the wing trailing edge inside the boundary layer. **LINEAR AND NONLINEAR MODAL ANALYSIS OF AEROELASTIC STRUCTURAL SYSTEMS**

R. A. IBRAHIM (Texas Tech University, Lubbock) and T. D. WOODALL (Sandia National Laboratories, Albuquerque, NM) Computers and Structures (ISSN 0045-7949), vol. 22, no. 4, 1986, p. 699-707. refs

This paper deals with the investigation of linear modal analysis and the autoparametric interaction of aeroelastic systems. The normal-mode frequencies and the associated mode shapes are obtained in terms of the system parameters. The main objective of the linear analysis is to explore the critical regions of autoparameteric (or internal) resonance conditions, Sum(k-i omega-i) = 0 (where k-i are integers and omega-i are the normal-mode frequencies). The results show that for certain system parameters the condition of internal resonance is satisfied. The dynamic behavior of the structure in the neighborhood of internal-resonance conditions is obtained by considering the nonlinear coupling of the normal modes. Under certain conditions the steady-state response is derived analytically for the sum internal-resonance condition. It is concluded that the nonlinear modal analysis reveals certain types of response characteristics which cannot be interpreted within the framework of the linear theory of small oscillations. This paper summarizes the approach and findings of research into reliability, supportability, and survivability prediction techniques for fault-tolerant avionics systems. Since no technique existed to analyze the fault tolerance of reconfigurable systems, a new method was developed and implemented in the Mission Reliability Model (MIREM). The supportability analysis was completed by using the Simulation of Operational Availability/Readiness (SOAR) model. Both the Computation of Vulnerable Area and Repair Time (COVART) model and FASTGEN, a survivability model, proved valuable for the survivability research. Sample results are presented and several recommendations are also given for each of the three areas investigated under this study: relaibility, supportablility and survivability. GRA

A fast voltage pulse is applied to a transducer which comprises a composite of multiple layers of alternately polarized piezoelectric material. These layers are bonded together and positioned over the curved leading edge of an aircraft wing structure. Each layer is relatively thin and metallized on both sides. The strain produced in the transducer causes the composite to push forward resulting in detachment and breakup of ice on the leading edge of the aircraft wing.

**COVARIANCE SPECIFICATION FOR THE LINEAR TIME-INVARIANT OUTPUT-FEEDBACK CONTROL SYSTEMS USING A KALMAN FILTER**
M. NAGAYASU 1985 16 p refs In JAPANESE; ENGLISH summary
(NAL-TR-862; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

The covariance specification problem using a Kalman filter for the linear time-invariant output-feedback control system contaminated by observation and system noise is described. The optimal output-feedback control using a Kalman filter with which the stationary state covariance matrix coincides with the prescribed matrix is discussed. The system is disturbed by additive white/color system noise and the output signal is contaminated by white observation noise. Using a Kalman filter, the dynamic output feedback control system was obtained. The covariance specification problem, i.e., to obtain the optimal feedback gains under the requirements of the state covariance coinciding with the prescribed covarience for minimizing the control effort, is solved. The control problem of an aircraft in the atmospheric turbulence is discussed as a numerical example. Author

A rotary optical position transducer employing a pulse technique time delay multiplexor was studied during the development of a Fly-By-Light (FBL) for the aircraft control system, the aim of which is to offer inherent resistance to environments of electromagnetic interference (EMI), electromagnetic pulse (EMP) and lightning. The conventional absolute type optical digital transducer causes difficulty in the interface technique between the transducer and other devices such as a computer. The transducer system described consisting of a rotary position transducer unit, fiber optic cable, light source unit, and electronics interface unit, can improve this interface technique. The rotary transducer unit is an electrically passive device connected through optical fibers to the light source unit and electronics interface unit, and has many advantages of fiber optic techniques. Basic problems in the development of the rotary transducer system were studied. In particular, a basis for optimizing illumination irradiance and photodetector characteristics is given, and the intrinsic performance of the transducer is quantitatively examined. Author

Models of hollow fan blades were made and tested to prove that their strength is sufficient for use in real engines. The hollow blades were fabricated by diffusion bonding of two titanium alloy (6Al-4V-Ti) plates, one of which had three spanwise stiffners and the other being flat plate. The model as a nontwisted tapered blade. Impact tests were carried out on the hollow fan blade models in which the ingestion of a 1.5 pounds bird was simulated. Solid blades with the same external form were also tested by similar methods for comparison. The results of these tests show that properly designed hollow blades have sufficient stiffness and strength for use as fan blades in the turbo-fan engine. Author

R. A. ELY *In* AFWAL Vibration Damping 1984 Workshop Proceedings 32 p Nov. 1984 refs
Avail: NTIS HC A99/MF A01 CSCL 20K

The application of constrained layer damping, in the form of laminated skins, frames, and equipment racks, to control acoustic fatigue of structures and vibration of equipment in the aft fuselage sections of large aircraft is discussed. It is shown that the influence of constrained layer damping on the response of a honeycomb panel at its critical frequency is very different from the influences on its resonant responses. The discussed baseline data and background methodology include: laboratory characterization of materials, acoustical fatigue tests of baseline and laminated structures, peculiarities of structures with high damping, influences of various boundary conditions on damped panels, dynamic versus static stiffness of damped panels, and comparisons of predicted and measured stresses in damped and undamped panels that are representative of aircraft structures. Advanced metallic technology and constrained layer damping are utilized to redesign the A-7 center section leading edge flap and the F-111 outboard spoiler to achieve large increases in their acoustical fatigue lives. **USE OF SKIN DAMPING TREATMENTS TO CONTROL AIRFRAME DYNAMIC RESPONSE FOR INTERIOR NOISE CONTROL**
C. I. HOLMER *In* AFWAL Vibration Damping 1984 Workshop Proceedings 19 p Nov. 1984 refs
Avail: NTIS HC A99/MF A01 CSCL 20K

A conceptual model for airframe and interior trim dynamic response. The model suggests that skin response in the frequency range may be affected by skin damping treatments. It is suggested that this motion is of significance in producing interior noise. Laboratory data of system loss factors for a new constrained layer, skin damping treatment show improved damping performance at lighter weight than other commercially available skin damping materials. Experimental data on an effective skin damping treatment which produces system loss factors which contribute significantly to total losses in the airframe in the presence of other loss mechanisms associated with the outfitted airframe are presented. The effective skin damping treatment reduces airframe motion at representative trim panel attachment points, suggesting role in the reduction of aircraft interior noise. E.A.K.

**FULL-SCALE TRANSPORT CONTROLLED IMPACT DEMONSTRATION**

R. J. HAYDUK, comp. Jan. 1986 356 p refs Workshop held in Hampton, Va., 10 Apr. 1985; sponsored by NASA. Langley Research Center and FAA
(NASA-CP-2395; L-16048; NAS 1.55:2395) Avail: NTIS HC A16/MF A01 CSCL 20K

The controlled impact demonstration (CID) test of a transport aircraft took place on December 1, 1984, crashing at a prepared site on Rogers Dry Lakebed, Edwards Air Force Base, California. The demonstration was a setback for the antimisting kerosene (AMK) researchers. The impact conditions, considerably different from the planned scenario, exposed large quantities of degraded AMK and hydraulic fluid and caused unexpectedly hot ignition sources, bulk loss of fuel from the right wing, airflow patterns over the wings and fuselage that were untested on AMK, and fuel intrusion into the lower fuselage. The test was much more severe than planned and is generally considered to be unrepresentative of the type of survivable crash that would benefit from AMK. Ninety-seven percent of the sensors on the fuselage and wing structure, seats, dummies, restraint systems, galley, and bins were active at impact. A wealth of sensor data was collected from this once-in-a-lifetime research test. The flight data recorder experiments on board were also generally successful.

**CID OVERVIEW**

R. J. HAYDUK *In its* Full-Scale Transport Controlled Impact Demonstration p 1-16 Jan. 1986 refs
Avail: NTIS HC A16/MF A01 CSCL 20K

On December 1, 1984, NASA and the Federal Aviation Administration (FAA) conducted the first remotely piloted air-to-ground crash test of a transport category aircraft. The Full-Scale Transport Controlled Impact Demonstration (CID) was the culmination of 4 years of effort by the two agencies. NASA and the FAA had many objectives during the joint planning and execution of the Controlled Impact Demonstration. The structural loads experiment was very successful. Ninety-seven percent of the channels were active at impact. The data is still being assessed. Only a portion of the data is presented here; approximately 80 channels of data are available. Analysis of the remaining data is in progress. Interior photography was also very successful. One hundred percent of the cameras functioned. The film contains unique information on the development of fire and smoke in the interior of the aircraft. From a human tolerance point of view, the CID was simulation of a survivable crash. R.J.F.

**NASA EXPERIMENTS ON THE B-720 STRUCTURE AND SEATS**

E. ALFARO-BOU *In its* Full-Scale Transport Controlled Impact Demonstration p 29-47 Jan. 1986
Avail: NTIS HC A16/MF A01 CSCL 20K

Two experiments onboard a remotely piloted transport aircraft that was crashed on landing are discussed. The structural experiment deals with the location and distribution of the instrumentation throughout the airplane structure. In the seat experiment, the development and testing of an energy absorbing seat are discussed. The objective of the structural experiment was to obtain a data base of structural crash loads for use in the advancement of crashworthy technology of materials (such as composites) in structural design and for use in the comparison between computer and experimental results. The objective of the seat experiment was to compare the performance of an energy absorbing transport seat and a standard seat when subjected to similar crash pulses. Details are given on the location of instrumentation, on the dynamic seat test pulse and headward acceleration limits. R.J.F.

**CONTROLLED IMPACT DEMONSTRATION SEAT/CABIN RESTRAINT SYSTEMS: FAA**

R. A. JOHNSON *In* NASA. Langley Research Center Full-Scale Transport Controlled Impact Demonstration p 49-60 Jan. 1986
Avail: NTIS HC A16/MF A01 CSCL 20K

The FAA restraint system experiments consisted of 24 standard and modified seats, 2 standard galleys and 2 standard overhead compartments. Under the controlled impact demonstration (CID) program, the experimental objective was to demonstrate the effectiveness of individual restraint system designs when exposed to a survivable air-to-ground impact condition. What researchers were looking for was the performance exhibited by standard and modified designs, performance differences resulting from their installed cabin location, and interrelating performance demonstrated by test article and attaching floor and/or fuselage structure. The other restraint system experiment consisted of 2 standard overhead stowage compartments and 2 galley modules. Again, researchers were concerned with the retention of stowed equipment and carry-on articles. The overhead compartments were loaded with test weights up to their maximum capacity, and each of the galleys was filled with test articles: aft with normal galley equipment, forward with hazardous material test packages. A breakdown of instrumentation and distribution is given beginning with 11 instrumented type anthropomorphic dummies and 185 sensors which provided for acceleration and load measurements at the various experiment and associated structure locations. The onboard cameras provided additional coverage of these experiments, including the areas of cabin which were not instrumented. Test results showing the window-side leg forces versus pulse duration are given. R.J.F.

**NASA SEAT EXPERIMENT AND OCCUPANT RESPONSES**

E. L. FASANELLA *In* NASA. Langley Research Center Full-Scale Transport Controlled Impact Demonstration p 79-89 Jan. 1986 refs
Avail: NTIS HC A16/MF A01 CSCL 20K

Results of the crash test of a remotely piloted transport aircraft instrumented to measure a NASA energy-absorbing transport seat are given. Human tolerance limits to acceleration and a dynamic response index model are discussed. It was found that the acceleration levels at the rear of the airplane were quite low and were below the stroking threshold of the NASA EA-seat. Therefore, dummies in the standard and EA-seat responded approximately the same. All longitudinal accelerations were quite low for the primary impact with very low forces measured in the lap belts. The vertical (spineward) acceleration levels measured in the dummies were also relatively low and very survivable from an impact tolerance standpoint. The pilot with an 18 G peak acceleration received by far the highest vertical acceleration and could have possibly received slight spinal injury. R.J.F.

From a total of 351 instrumentation channels, 341 channels (97%) were in operation during the initial impact of the airplane. Both NASA seats, the energy absorbing seat and the standard seat, maintained their integrity during the impact. The floor accelerations at the seat locations were lower than the accelerations required for the energy absorbers to stroke; consequently, the energy absorbing seat did not stroke. The two seats remained firm in place during the crash and no seat attachment failures were observed. Due to the low accelerations experienced during the crash, both seats performed as standard seats. In the airplane structure, the accelerations were higher at both the point of impact in the left wing and at the forward end of the fuselage. The accelerations on the floor were higher toward the front than toward the rear and the floor accelerations on the left side were higher than on the right side at the front of the fuselage, but toward the rear they evened out. According to preliminary examination of the data, out of 179 data channels that were onboard the aircraft in support of the seat experiments, there is data from 168. There was somewhat more severe environment imposed in the structure of the obstacles than by the ground impact. Therefore, both ground impact and obstacle impact are of interest for crashworthiness experiments. Most of the data channels that were studied are fairly consistent with the physical evidence: they show acceleration levels that are reasonable, and in many cases those integrate out to a reasonable velocity change. Finally, from observation thus far, the ground impact did not fail or significantly damage any seat. Nor did any of the energy absorbers in the modified seats extend. The accelerations do not appear high enough and/or energetic enough to cause this to happen. At this time, the onboard films have not been studied; only some videotape have been viewed. Some of the seats were so badly damaged by the fire that any failures which might have occurred were obscured. A close examination of the onboard films using a stop-action projector will allow a more thorough evaluation. Author

**CONTROLLED IMPACT DEMONSTRATION AIRFRAME BENDING BRIDGES**
S. J. SOLTIS *In* NASA. Langley Research Center Full-Scale Transport Controlled Impact Demonstration p 157-179 Jan. 1986
Avail: NTIS HC A16/MF A01 CSCL 20K

The calibration of the KRASH and DYCAST models for transport aircraft is discussed. The FAA uses computer analysis techniques to predict the response of controlled impact demonstration (CID) during impact. The moment bridges can provide a direct correlation between the predictive loads or moments that the models will predict and what was experienced during the actual impact. Another goal is to examine structural failure mechanisms and correlate with analytical predictions. The bending bridges did achieve their goals and objectives. The data traces do provide some insight with respect to airframe loads and structural response. They demonstrate quite clearly what's happening to the airframe. A direct quantification of metal airframe loads was measured by the moment bridges. The measured moments can be correlated with the KRASH and DYCAST computer models. The bending bridge data support airframe failure mechanisms analysis and provide residual airframe strength estimation. It did not appear as if any of the bending bridges on the airframe exceeded limit loads. (The observed airframe fracture was due to the fuselage encounter with the tomahawk which tore out the keel beam.) The airframe bridges can be used to estimate the impact conditions and those estimates are correlating with some of the other data measurements. Structural response, frequency and structural damping are readily measured by the moment bridges. R.J.F.

It was found that the sampling rates from flight recorders on a remotely piloted transport aircraft that crashed into the ground were too low, although they were higher than those required now by regulations. For example, the sampling rate for roll angle was one per second. The sampling rate for normal acceleration was also fairly low. Existing regulations require only 4 samples per second; researchers had 16 samples per second. Some data was lost during the initial impact. The frequency response data was adequate. R.J.F.

Avail: NTIS HC A16/MF A01 CSCL 20K

The operation of a radio beacon position locator during and after the remotely controlled transport aircraft is discussed. The radio beacon transmission was actuated and was picked up by the Navy P-3A chase aircraft for a short time, after which reception was lost. The pilot reported that he received a signal on both 121.5 MHz and 243 MHz for a period of approximately 5 seconds. Five minutes after the crash a portable direction finding unit located on the roof of the NASA Dryden Flight Research Facility, 4 miles distant from the crash, was unable to pick up the beacon transmission. The fire crews started fighting the fires approximately 90 seconds after the time of impact. Navy personnel access to the crash site was allowed on the morning of December 2, 1984. Radio beacon locator was found resting top side up, 15 feet forward and 13 feet perpendicular from the tray location the starboard side of the aircraft. An immediate inspection indicated the airfoil suffered moderate fire damage with paint peeling but not intumescing. The visual marker strobe lamp housings were intact but extensively burned such that it was impossible to see if the lamps had survived. The airfoil suffered minor structural damage, with assorted dents, etc. The extended plunger on the ARU-21 release unit indicated that the pyrotechnic deployment system operated. The radio beacon base (tray) suffered some heat and fire damage, and was charred and blackened by smoke. The frangible switch in the nose survived and the switch in the belly was recovered and found to have actuated. It is assumed that this switch fired the ARU-21 squib. There were no other release switches installed in the normally open system in the aircraft. R.J.F.

**CONTROLLED IMPACT DEMONSTRATION ON-BOARD (INTERIOR) PHOTOGRAPHIC SYSTEM**

C. J. MAY *In its* Full-Scale Transport Controlled Impact Demonstration p 209-239 Jan. 1986 refs

Avail: NTIS HC A03/MF A01 CSCL 20K

Langley Research Center (LaRC) was responsible for the design, manufacture, and integration of all hardware required for the photographic system used to film the interior of the controlled impact demonstration (CID) B-720 aircraft during actual crash conditions. Four independent power supplies were constructed to operate the ten high-speed 16 mm cameras and twenty-four floodlights. An up-link command system, furnished by Ames Dryden Flight Research Facility (ADFRF), was necessary to activate the power supplies and start the cameras. These events were accomplished by initiation of relays located on each of the photo power pallets. The photographic system performed beyond expectations. All four power distribution pallets with their 20 year old Minuteman batteries performed flawlessly. All 24 lamps worked. All ten on-board high speed (400 fps) 16 mm cameras containing good resolution film data were recovered. R.J.F.

**CID-720 AIRCRAFT HIGH-ENVIRONMENT FLIGHT INSTRUMENTATION SYSTEM**

R. S. CALLOWAY *In its* Full-Scale Transport Controlled Impact Demonstration p 241-287 Jan. 1986

Avail: NTIS HC A16/MF A01 CSCL 20K

The high-environment flight instrumentation system was designed to acquire Langley's structural response data during the full scale transport-controlled impact demonstration test. There was only one opportunity for data acquisition. Thus, a high reliability and crashworthy design approach was implemented. The approach featured multi-level redundancy and a vigorous quality assurance testing program. Complying with an accelerated schedule, the instrumentation system was developed, tested and shipped within 18 months to Dryden Flight Research Facility. The flight instrumentation system consists of two autonomous data systems, DAS #1 and #2, and an excellent checkout subsystem. Each data system is partitioned into four pallets. The system was designed to operate on manned and unmanned flights. There are 176 data channels per data system. These channels are sequentially sampled and encoded into 1 megabit/sec pulse code modulation (PCM) data signal. To increase the probability of success, a special PCM distribution subsystem was developed. This subsystem distributes the PCM signal to two transmitters, one delay memory, and eight recorder tracks. The data on four of these trackes was digitally delayed approximately 300 msec to maximize data acquisition during impact. Therefore each data system's data is redundantly recorded onboard and on the ground. There are two time code generators. Parallel time from each is encoded into both data systems. Serial time from each is redundantly recorded on both onboard recorders. Instrumentation power is independent of aircraft power and self-contained. R.J.F.

**IMPACT DYNAMICS INSTRUMENTATION**

R. F. MCCORMCK *In its* Full-Scale Transport Controlled Impact Demonstration p 289-301 Jan. 1986

Avail: NTIS HC A16/MF A01 CSCL 20K

One of the tasks specified in the NASA Langley controlled impact demonstration (CID) work package was to furnish dynamic instrumentation sensors. The types of instrumentation sensors required were accelerometers for aircraft structural loads measurements, seat belt load cells to measure anthropomorphic dummy responses to the aircraft impact, and strain gage bending bridges to measure the aircraft fuselage and wing bending during impact. The objective in the selection of dynamic instrumentation for the CID was to provide 352 of the highest quality transducers and remain within budget allocation. The transducers that were selected for the CID evaluation process were each subjected to rigorous laboratory acceptance tests and to aircraft fuselage section drop tests at the LaRC Impact Dynamics Research Facility. Data compiled from this series of tests showed the selected transducers to be best suited for the CID mission requirement. The transducers installation technique on the airframe proved successful. The transducer quality assurance was guaranteed through rigorous acceptance testing. Data acquired was 97.0%. R.J.F.

**CID-720 AIRCRAFT LANGLEY RESEARCH CENTER PREFLIGHT HARDWARE TESTS: DEVELOPMENT, FLIGHT ACCEPTANCE AND QUALIFICATION**

J. D. PRIDE *In its* Full-Scale Transport Controlled Impact Demonstration p 303-328 Jan. 1986 refs

Avail: NTIS HC A16/MF A01 CSCL 20K

The testing conducted on LaRC-developed hardware for the controlled impact demonstration transport aircraft is discussed. To properly develop flight qualified crash systems, two environments were considered: the aircraft flight environment with the focus on vibration and temperature effects, and the crash environment with the long pulse shock effects. Also with the large quantity of fuel in the wing tanks the possibility of fire was considered to be a threat to data retrieval and thus fire tests were included in the development test process. The aircraft test successfully demonstrated the performance of the LaRC developed heat shields. Good telemetered data (S-band) was received during the impact and slide-out phase, and even after the aircraft came to rest. The two onboard DAS tape recorders were protected from the intense fire and high quality tape data was recovered. The complete photographic system performed as planned throughout the 40.0 sec of film supply. The four photo power distribution pallets remained in good condition and all ten onboard 16 mm high speed (400 frames/sec) cameras produced good film data. R.J.F.

**EQUIVALENT PLATE ANALYSIS OF AIRCRAFT WING BOX STRUCTURES WITH GENERAL PLANFORM GEOMETRY**

G. L. GILES Mar. 1986 12 p refs Proposed for presentation at the 27th AIAA/ASME/ASCE/ANS Structures, Structural Dynamics and Materials Conference, San Antonio, Tex., 19-21 May 1986

(NASA-TM-87697; NAS 1.15:87697; AIAA-86-0940-CP) Avail: NTIS HC A02/MF A01 CSCL 20K

A new equivalent plate analysis formulation is described which is capable of modeling aircraft wing structures with a general planform such as cranked wing boxes. Multiple trapezoidal segments are used to represent such planforms. A Ritz solution technique is used in conjunction with global displacement functions which encompass all the seyements. This Ritz solution procedure is implemented efficiently into a computer program so that it can be used by rigorous optimization algorithms for application in early preliminary design. A *direct method* to interface this structural analysis procedure with aerodynamic programs for use in aeroelastic calculations is described. This equivalent plate analysis procedure is used to calculate the static deflections and stresses and vibration frequencies and modes of an example wing configuration. The numerical results are compared with results from a finite element model of the same configuration to illustrate typica levels of accuracy and computation times resulting from use o this procedure. **CHARACTERIZATION OF SHALLOW OCEAN SEDIMENTS USING THE AIRBORNE ELECTROMAGNETIC METHOD**
I. J. WON (National Space Technology Laboratory, Bay St. Louis, MS; North Carolina State University, Raleigh) and K. SMITS (National Space Technology Laboratory, Bay St. Louis, MS) IEEE Journal of Oceanic Engineering (ISSN 0364-9059), vol. OE-11, Jan. 1986, p. 113-122. refs

Experimental airborne electromagnetic (AEM) survey data collected in Cape Cod Bay are used to derive continuous profiles of water depth, electrical depth, water conductivity, and bottom sediment conductivity. Through a few well-known empirical relationships, the conductivities are used, in turn, to derive density, porosity, sound speed, and acoustic reflectivity of the ocean bottom. A commercially available Dighem III AEM system was used for the survey without any significant modification. The helicopter-borne system operated at 385 and 7200 Hz; both were in a horizontal coplanar configuration. The interpreted profiles show good agreement with available ground truth data. Where no such data are available, the results appear to be very reasonable. Compared with the shipborne electrode array method, the AEM method can determine the necessary parameters at a much higher speed with a better lateral resolution over a wide range of water depths from 0 to perhaps 100 m. The bottom sediment conductivity that can be measured by the AEM method is closely related to physical properties of sediments, such as porosity, density, sound speed, and, indirectly, sediment types that might carry broad implications for various offshore activities. (Contract NAGW-468)

The directional spectrum and the microwave modulation transfer function of ocean waves can be measured with the airborne two frequency scatterometer technique. Similar to tower based observations, the aircraft measurements of the Modulation Transfer Function (MTF) show that it is strongly affected by both wind speed and sea state. Also detected are small differences in the magnitudes of the MTF between downwind and upwind radar look directions, and variations with ocean wavenumber. The MTF inferred from the two frequency radar is larger than that measured using single frequency, wave orbital velocity techniques such as tower based radars or ROWS measurements from low altitude aircraft. Possible reasons for this are discussed. The ability to measure the ocean directional spectrum with the two frequency scatterometer, with supporting MTF data, is demonstrated. M.A.C.

**FORECASTING FOR CIVIL AVIATION. I**
L. DENT (Meteorological Office, Bracknell, England) Weather (ISSN 0043-1656), vol. 41, Feb. 1986, p. 42-48.

The development of forecasts for civil aviation is described. The International Civil Aviation Organization has developed a two-tiered system to provide airlines with the forecast information they require. The procedure involves utilizing global forecast models to forecast grid point data for upper winds and temperatures up to 45,000 ft. These data are supplied to regional forecast centers where wind and temperature charts with tropopause data are prepared; terminal airport forecasts are developed from these charts and applied to landings and take-offs and flight planning. The need to have current information available on surface wind on the runway, surface pressure, weather cloudbase and visibility, upper winds, and turbulence is examined. I.F.

T. KUZNETSOVA and A. PIMENOV *In its* USSR Report: Earth Sciences (JPRS-UES-86-001) p 1-2 10 Jan. 1986 Transl. into ENGLISH from Pravda Ukrainy (Kiev, USSR), 15 Aug. 1985 p 4
Avail: NTIS HC A04

The development of the AN-30M airplane mode, which can modify the weather is discussed. It has excellent flight qualities, high reliability, and modern pilotage-and-navigation equipment that permits flight routes and course changes in the semiautomatic mode and takeoffs during daytime and nighttime, in difficult weather conditions. Ammunition against precipitation (crystalline and other reagents) is loaded into containers placed inside and outside the aircraft on external mounts with a streamlined shape. The instruments evaluate weather conditions outside the airplane and decide at what altitude the cloud cover should be seeded and on the methods to be used. The AN-30M seeds clouds with frozen carbon dioxide granules. The plane can induce additional rainfall on farmlands, increase snow cover, and extinguish forest fires. E.A.K.

**ANALYSIS OF AERODYNAMIC COEFFICIENTS USING GRADIENT DATA: SPANWISE TURBULENCE EFFECTS ON AIRPLANE RESPONSE Report, 3 Jun. 1983 - 2 Jun. 1985**
E. A. RINGNES and W. FROST Washington NASA Feb. 1986 70 p refs
(Contract NAS8-35186)
(NASA-CR-3961; NAS 1.26:3961) Avail: NTIS HC A04/MF A01 CSCL 04B

The influence of spanwise turbulence on airplane dynamic behavior is determined. Calculations are based on data collected from test flights with the NASA B-57 research aircraft. The approach is to first compute aerodynamic forces and moments due to a spanwise distribution of angle of attack and airspeed. Secondly, these quantities are incorporated into the equations of motion. Simulation of flights done with the effects of spanwise turbulence included are compared to simulations without any spanwise turbulence. The findings of the study are that the moments developed by turbulence along the span are significant and that more realistic flight simulation can be achieved by including the spanwise turbulence terms. (AD-A161543; DOT-TSC-FAA-85-8; DOT/FAA/PM-85/21) Avail: NTIS HC A05/MF A01 CSCL 04B

A microburst advisory service project was conducted at Stapleton International Airport for a six week period during the summer of 1984. This report describes what took place during the project and what was learned from an operational, air traffic control viewpoint. Specifically, the report describes: (1) The operational, Doppler weather radar-based, microburst advisory service provided to pilots; (2) An unplanned and informal, Doppler radar-based, gust front advisory service initiated partway through the project and used by the FAA for runway management purposes; (3) The operational impact on runway operations of an unexpected, low-altitude, wind shear feature in which individual microbursts form a relatively long-lived line structure; and (4) The low-altitude wind shear environment faced by Stapleton controllers and pilots during the six week project, which took place at the peak of the Denver thunderstorm season. A microburst is a small, short-lived, low-altitude, thunderstorm-related, wind shear feature that can exhibit an intense, complex wind shear pattern that can be particularly hazardous to landing and departing aircraft. FAA-funded Doppler weather radar activities during the period 1 January to 31 March 1985 are reported. The test-bed Doppler weather radar system measurements in Olive Branch, Mississippi, commenced following the installation of an improved lightning protection system. Clutter suppression testing showed that the objective of 50-dB suppression was obtained in the field against appropriate fixed targets. Weather measurements were conducted on a number of cold front passages with attendant prefrontal lines of showers and thunderstorms. The Lincoln mesonet was recalibrated at Lincoln in January and February and then installed at the site in late February. The mesonet was fully operational in March. The 1984 peak wind speed data from the mesonet and the Memphis International Airport LLWAS data were analyzed preliminarily to determine wind shear characteristics in the Memphis area. Doppler weather radar data from the National Center for Atmospheric Research JAWS program and the National Severe Storms Laboratory are being analyzed to develop low-altitude wind shear detection algorithms. **AUDITORY SIGNALS IN MILITARY AIRCRAFT - ERGONOMIC PRINCIPLES VERSUS PRACTICE**

T. J. DOLL and D. J. FOLDS (Georgia Institute of Technology, Atlanta) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 958-965. refs

(Contract F33615-82-D-0601)

The complete ensembles of auditory signals in selected USAF aircraft (the F-4D, F-15, two models of the F-16, the C-5, and the C-141) are described and evaluated. Human factors research related to the design of speech and non-speech auditory signals is reviewed. Major findings are: that auditory signals are not well standardized among the aircraft, even between those with similar combat roles; that a relatively large number of non-speech auditory signals are used, which may make it difficult for the aircrew to recall the meanings of all the signals; that some non-speech signals are sufficiently similar that they may be confused, particularly in high workload and stressful conditions; and that the criticality of the warnings is not reliably indicated by any characteristics of the signals. Four problem areas requiring further research are discussed: reduction of signal loudness, enhancement of the distinctiveness and masking resistance of non-speech signals, effects of concurrent warning signals on aircrew performance, and additional uses of auditory information. Author

**DYNAMIC RETRAINING APPROACHES FOR AN AIRBORNE SPEECH RECOGNITION SYSTEM**

R. A. NORTH and K. GRAFFUNDER (Honeywell Systems and Research Center, Minneapolis, MN) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 970-974.

(Contract F33615-83-C-3608)

Results of a preliminary investigation of the viability of dynamic updating of a word recognizer are reported. An isolated word recognizer was used to capture original templates and task oriented utterances for an aircraft cockpit radio frequency selection task performed by a group of student pilots. The task-oriented utterances were produced in low and high workload conditions to represent differing operational stress. Match scores between original templates and real-time utterances were compared with match scores between real-time vs. real-time utterances. Two strategies were formulated for improvement of match scores using certain real-time utterances as new templates, and one is demonstrated with laboratory data. Author

**SELECTING COCKPIT FUNCTIONS FOR SPEECH I/O TECHNOLOGY**

C. A. SIMPSON (Psycho-Linguistic Research Associates, Menlo Park, CA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 979-986. Army-supported research. refs

(Contract NAS2-11341)

A general methodology for the initial selection of functions for speech generation and speech recognition technology is discussed. The SCR (Stimulus/Central-Processing/Response) compatibility model of Wickens et al. (1983) is examined, and its application is demonstrated for a particular cockpit display problem. Some limits of the applicability of that model are illustrated in the context of predicting overall pilot-aircraft system performance. A program of system performance measurement is recommended for the evaluation of candidate systems. It is suggested that no one measure of system performance can necessarily be depended upon to the exclusion of others. Systems response time, system accuracy, and pilot ratings are all important measures. Finally, these measures must be collected in the context of the total flight task environment. D.H.

**WICKENS' RESOURCE ALLOCATION MODEL - IMPLICATIONS FOR THE DESIGN OF HUMAN-MACHINE SYSTEMS**

L. A. WHITAKER (Missouri-St. Louis, University, St. Louis) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1040-1044. refs

A fundamental question of systems design is examined: can one person operate a given system or will it take two? The answer depends on the load that the system imposes on the operator. The model of Wickens, Sandry and Vidulich (1983) suggests that a single operator can draw from a number of separate internal resources to perform a complex task (such as fly an aircraft, provide air traffic control, or execute underwater maintenance tasks). If this model is correct, then systems can be designed to make optimal use of these separate resources within a single operator. The model is discussed and available evidence tending to support or refute it is examined. Implications for the design of air traffic control communications are noted. D.H.

**IMPROVING INTELLIGIBILITY IN AUDIO DISTRIBUTION SYSTEMS**

P. J. GRECO (Telephonics Corp., Huntington, NY) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1564-1569. refs

Some of the most current techniques for increasing intelligibility in audio distribution systems operating in high ambient noise environments (engine noise, weapons launch, helicopter rotor slap, etc.) are examined. As part of a program to develop the new Tri-Service Digital Audio Distribution System (DADS), a systems approach has been taken to improving intelligibility. The solutions include better noise canceling microphones, active signal enhancement at the audio input, and both passive and active noise canceling devices as the headset. Initial data show that intelligibility scores of better than 75 percent in pink noise environments greater than 115 dB SPL have been achieved. D.H.

**EVALUATION OF 16 MEASURES OF MENTAL WORKLOAD USING A SIMULATED FLIGHT TASK EMPHASIZING MEDIATIONAL ACTIVITY**

W. W. WIERWILLE, M. RAHIMI, and J. G. CASALI (Virginia Polytechnic Institute and State University, Blacksburg) Human Factors (ISSN 0018-7208), vol. 27, Oct. 1985, p. 489-502. Research supported by the Virginia Polytechnic Institute and State University. refs

(Contract NAG2-17)

As aircraft and other systems become more automated, a shift is occurring in human operator participation in these systems. This shift is away from manual control and toward activities that tap the higher mental functioning of human operators. Therefore, an experiment was performed in a moving-base flight simulator to assess mediational (cognitive) workload measurement. Specifically, 16 workload estimation techniques were evaluated as to their sensitivity and intrusion in a flight task emphasizing mediational behavior. Task loading, using navigation problems presented on a display, was treated as an independent variable, and workload-measure values were treated as dependent variables. Results indicate that two mediational task measures, two rating scale measures, time estimation, and two eye behavior measures were reliably sensitive to mediational loading. The time estimation measure did, however, intrude on mediational task performance. Several of the remaining measures were completely insensitive to mediational load. Author

**HEAD-UP/HEAD-DOWN TRANSITION - MEASUREMENT OF TRANSITION TIMES**

J.-P. R. MENU (Centre d'Etudes et de Recherches de Medecine Aerospatiale, Paris, France) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 57, March 1986, p. 218-222. DRET-supported research. refs

A method to measure transition times between a head-up display (HUD) signal and a response given to a head-down display (HDD) was developed, using a three-segmented paradigm and testing various vocal and manual arrangements in a fighter aircraft mock-up. The shortest transition times were obtained for voice responses (1600 msec between a HUD signal and a simple response to the HDD). A comparison of the perception and transition times of a 'positive' contrast (green symbols on black background) with a 'negative' contrast (black symbols on green) has indicated both shorter perception and shorter transition times for the positive contrast. This method permits of the effects evaluation of changes in psychological conditions (such as heavier information processing) and physiological conditions (changing accommodation, gaze axis, and convergence) of a dynamic aeronautical environment on the speeds of acquisition and processing of information. I.S.

**THE ROLE OF VIBRATION AND RATTLE IN HUMAN RESPONSE TO HELICOPTER NOISE Final Report**

P. D. SCHOMER and R. D. NEATHAMMER Sep. 1985 161 p
(AD-A162486; CERL-TR-N-85/14) Avail: NTIS HC A08/MF A01 CSCL 05J

Our understanding of community reaction to helicopter noise remains incomplete. A technique called A-weighting appears to produce realistic data outdoors and at modest noise levels, and the community response in terms of percentage of population highly annoyed can be correlated with respect to the Day/Night Average Sound Level (DNL) descriptor. However, questions remain as to the effect of perceived building vibrations and rattle in human response to helicopter noise. To answer these questions, this study examined the role of vibration and rattle in human response to helicopter noise. Many volunteer subjects were tested under real noise conditions. The helicopter noise was generated by an Army UH-1H (Huey) helicopter. Subjects were located either in the living room of a new mobile home, outdoors, or in the living room or dining room of an old frame farmhouse near Champaign IL. The control or comparison sound was generated electronically through loudspeakers at each location using a 500-Hz octave band of white noise. By performing paired comparison tests between the helicopter and control noises, it was possible to establish equivalency between these two stimuli. Author (GRA)

**DIRECT MODEL REFERENCE ADAPTIVE CONTROL OF A FLEXIBLE ROBOTIC MANIPULATOR**

D. R. MELDRUM 15 Dec. 1985 90 p refs
(Contract NAS7-918)
(NASA-CR-176659; JPL-PUB-85-100; NAS 1.26:176659) Avail: NTIS HC A05/MF A01 CSCL 05H

Quick, precise control of a flexible manipulator in a space environment is essential for future Space Station repair and satellite servicing. Numerous control algorithms have proven successful in controlling rigid manipulators with colocated sensors and actuators; however, few have been tested on a flexible manipulator with noncolocated sensors and actuators. In this thesis, a model reference adaptive control (MRAC) scheme based on command generator tracker theory is designed for a flexible manipulator. Quicker, more precise tracking results are expected over nonadaptive control laws for this MRAC approach. Equations of motion in modal coordinates are derived for a single-link, flexible manipulator with an actuator at the pinned-end and a sensor at the free end. An MRAC is designed with the objective of controlling the torquing actuator so that the tip position follows a trajectory that is prescribed by the reference model. An appealing feature of this direct MRAC law is that it allows the reference model to have fewer states than the plant itself. Direct adaptive control also adjusts the controller parameters directly with knowledge of only the plant output and input signals. Author

**NUMERICAL FIXED-POINT SOLUTION FOR NEAR-OPTIMUM REGULATORS OF LINEAR QUADRATIC GAUSSIAN CONTROL PROBLEMS FOR SINGULARLY PERTURBED SYSTEMS**

Z. GAJIC (Rutgers University, Piscataway, NJ) International Journal of Control (ISSN 0020-7179), vol. 43, Feb. 1986, p. 373-387. refs
(Contract NSF ECF-82-05337)

The fixed-point method is developed for obtaining an efficient numerical solution of the linear quadratic Gaussian problem for singularly perturbed systems. It is shown that each iteration step improves the accuracy by an order of magnitude, that is, the accuracy O(epsilon-k) can be obtained by performing only k - 1 iterations. In addition, only low-order systems are involved in algebraic manipulations and no analyticity requirements are imposed on the system coefficients. Author

**MODELING AND SIMULATION. VOLUME 15 - PROCEEDINGS OF THE FIFTEENTH ANNUAL PITTSBURGH CONFERENCE, UNIVERSITY OF PITTSBURGH, PA, APRIL 19, 20, 1984. PART 5 - GENERAL MODELING AND SIMULATION**

W. G. VOGT, ED. and M. H. MICKLE, ED. Research Triangle Park, NC, Instrument Society of America, 1984, 317 p. No individual items are abstracted in this volume.

Consideration is given to the general modeling and simulation problems which were addressed at the Fifteenth Annual Pittsburgh Conference on Modeling and Simulation. Among the specific problems discussed are: air-traffic control simulation; the influence of sampling rate on a pilot's assessment of the handling characteristics of a simulated aircraft; and the application of job simulation in evaluating alternative layout plans. Consideration is also given to: modeling of real systems; analysis of cracking reactions in structures; polymerization simulations; and modeling of a flight operations manual for the International Ultraviolet Explorer (IUE) spacecraft. Additional topics discussed include: analog simulation of Josephson effects; simulation and optimization models for integrated production planning; and hierarchical multilevel interactive systems simulators. **DATA-DRIVEN OPERATING CONCEPTS FOR REAL-TIME SIMULATION SYSTEMS**

R. A. WALLACE, D. O. HAGUE, and J. E. MCDONALD (USAF, Avionics Laboratory, Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 156-163.

Distributed computer architectures are widely applied to the design of real-time simulation systems for military use. The paper discusses one such architecture. It is for employment in modular and computationally expendable flight simulators and embedded computer system integration support facilities. The architecture is designed to combine and replace shared memory systems and packet switched networks for real-time use. The advantages and implementation of the combination is normally obscure. Shared memory systems are easy to program but limited in network utility. Packet switched networks are easy to configure but difficult to efficiently manage for an intensive real-time environment. Laboratory designs and simple experimental tests illustrate the details and the utility of the new architecture. Author

**STATE ESTIMATION ERRORS IN DIGITAL KALMAN FILTERS CAUSED BY MEASUREMENT DELAYS AND NUMERICAL INTEGRATION**

E. J. BAUMAN and C. E. FOSHA (Colorado, University, Colorado Springs) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 336-342.
(Contract F33615-84-K-3602)

Continuing analysis of state estimator errors in director weapon control systems has led to isolating several error sources. Numerically integrated measurements, data delays and data pre-filtering all cause Kalman filter state estimation errors. A simple tracking scenario shows tutorially both analytically and by simulation that these errors can be very significant. The analysis shows that these errors can be reduced by reducing the sampling period, increasing the order of the numerical integrator and/or appropriately delaying or filtering other measurements. Author

**REAL TIME OPTIMAL FLIGHT PATH GENERATION BY STORAGE OF MASSIVE DATA BASES**

Y. K. CHAN and M. FODDY (Boeing Co., Seattle, WA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 516-521.

Dynamic programming is traditionally considered too time consuming for real time applications in a fine scale. The storage of a massive precomputed data base of intermediate results in the dynamic programming process is proposed. The numerical processing in real time is then reduced to a manageable updating of this data base to account for new information in the vicinity of the airplane. Thus the full benefit of the optimization by dynamic programming can be realized even in a real time environment. Author

**A MODELING STRUCTURE FOR COMPUTER AIDED DESIGN**

C. A. HARVEY, D. P. JOHNSON, D. J. LOWRY, and T. D. PIERCE (Honeywell Systems and Research Center, Minneapolis, MN) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 642-646.

A structure is described for the representation of analytical design models of aircraft. This structure is motivated by the desire for automated data transmittal of a model that may be used by all design groups. Such a structure could lead to model standardization and better interdisciplinary communication. An illustrative example is also described to demonstrate some of the features in a specific environment. The example vehicle is the B-1A, and the model was used for the design of integrated flight control commands for terrain following/terrain avoidance using multivariable control technology. The dynamics of the engine and flexible aircraft with unsteady aerodynamics are included in the model. For this example, the modeling software is based on Honeyx routines and the UNIX operating system, but the general structure described should be appropriate for other operating systems and software packages. **AVOIDING PROBE TO MODEL COLLISIONS IN WIND TUNNEL TESTING**

G. W. WILLIAMS, JR. (USAF, Wright-Patterson AFB, OH) and K. K. GOROWARA (Wright State University, Dayton, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 720-727. refs

A set of programs has been developed whose ultimate function is to detect potential collisions between a moving probe and a movable model in the finite work space of a wind tunnel test section. This task is accomplished in a two step process. The first step incorporates an interactive 'three-dimensional object' editor, and the second step performs axis transformations and collision detection in real time. An object is defined by a set of faces, edges, and vertices. The collision detection routines transform the probe survey stations, probe 'three-dimensional object' and the model 'three-dimensional object' to world coordinates. The collision detection routines can then analytically determine if two objects in the work space have intersected by testing edges of one object for intersection with a face of another object. If no potential collision is found, the probe drive system is then allowed to move the probe. Author

### A NEW APPROACH TO ENSURING DETERMINISTIC PROCESSING IN AN INTEGRATED AVIONICS SOFTWARE SYSTEM

J. R. ELLIS (Harris Corp., Government Aerospace Systems Div., Melbourne, FL) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 756-763.

A software architecture providing mechanisms for highly reliable avionics systems which must integrate a variety of task execution rates and criticalities is presented. The executive supports single and multiprocessor systems for both cyclic and event driven tasks; foreground and background tasking with task suspension are implemented. Also covered are built-in-test features which ensure reliability. The architecture supports the use of high-level programming languages and is compatible with such advanced language features as 'tasking' and 'rendezvous' as defined for Ada. The architecture described here has been implemented in an integrated avionics software system for the Agusta A-129 Light Attack Helicopter. V.L.

### DESIGNING INTO THE UNKNOWN

M. HACKMAN (Boeing Military Airplane Co., Seattle, WA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 764-769.

The concept of 'configurable software', i.e., software generically constructed and table-driven to suit special contexts from tables read in at program initialization, is examined. Such an approach makes it possible to bypass many of the rigidities created by attempting to design from top down and many of the uncertainties involved in designing from bottom up. General guidelines for developing configurable software are discussed with reference to an effort to design track-file software to form the core of a battle-management system intended for the next generation of tactical fighters. V.L.

### A CASE STUDY IN SIMULATION VS. STIMULATION - THE B-1 WEAPON SYSTEM TRAINER

M. H. TAINT (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1062-1067.

A topic of controversy in the training technology area is discussed, namely the relative merits of functional simulation (software modeling) as opposed to stimulation (using aircraft processors and software) to simulate avionics processors and their associated software. A case study in the 'stim vs. sim' debate is examined by comparing the design approaches to simulating the offensive and defensive avionics processors on the original B-1 (the B-1A) and B-1B weapon system trainers. For the B-1A, both stations were to be functionally simulated, while the B-1B approach is a mixture of functional simulation of the defensive station with stimulation of the offensive station. Alternate approaches to avionics processor/software simulation is also discussed. D.H.

### DATA SYSTEMS FOR LOGISTICS EVALUATION DURING OPERATIONAL TEST

J. R. FINCH and W. T. MAULDIN (USAF, Operational Test and Evaluation Center, Kirtland AFB, NM) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1286-1288.

Data collection and processing systems used by the Operational Test Center to support its suitability evaluations are addressed. The Center uses the System Effectiveness Data System (SEDS) adn OMNIVORE (which accepts data from standard Air Force data collection systems) to support its evaluations of aircraft, munitions, and command, control and communications systems. These two systems are flexible and user-oriented and provide the data necessary to assess system reliability, maintainability, and availability. Additionally, Test Center personnel have developed microcomputer tools to assist in data projection and analysis. Efforts are under way to expand the capability for remote data input and analysis via microcomputer, to develop data systems appropriate to space systems, and to estimate the maturity of system software. D.H.

### EXPERT SYSTEMS FOR REAL TIME APPLICATIONS

J. K. CLEMA (IIT Research Institute, Annapolis, MD), R. WERLING (Technion International, Wilmington, DE), and A. CHANDE (Systems and Applied Sciences Corp., Vienna, VA) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1322-1329. refs

The problems of using and building on the methodology emmployed in today's 'expert systems' in a real-time laboratory-environment approach to demonstrate machine learning are discussed. Artificial intelligence and cognitive techniques applicable to dynamic, real-time, rapidly changing combat situations are examined. Expert systems which use modeling and simulation systems (such an AVSAIL models), off-the-shelf operations research tools, fuzzy logic, control theory, and decision theoretics are recommended as the approach DARPA should use in attaining the Pilot's Associate System goal of employing emerging machine intelligence technology to assist the combat pilot in advanced aircraft in the 1995 time period. A model of a dynamic, real-time, adaptive expert system is provided. D.H.

**A86-28407**

**EXPERT SYSTEM APPLICATIONS TO THE COCKPIT OF THE '90S**

K. FRANKOVICH (USAF, Washington, DC), K. PEDERSEN, and S. BERNSTEEN IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 2 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 1330-1335.

The requirements, enabling technologies, and potential structure of the next generation of avionics - employing expert systems - are addressed. Two examples of the potential of future avionics expert systems are considered: a navigation and route planning expert and a threat assessment and threat reaction expert. D.H.

**N86-21168#** National Aeronautical Lab., Bangalore (India). Aerodynamics Div.

**PARAMETRIC BI-CUBIC SURFACE PATCH FOR COMPUTER AIDED GEOMETRIC DESIGN OF AIRCRAFT AND/OR OTHER THREE-DIMENSIONAL GEOMETRIES**

H. N. V. DUTT Sep. 1985 58 p refs

(NAL-TM-AE-8505) Avail: NTIS HC A04/MF A01

A FORTRAN program was developed to fit smooth surfaces to the component parts of an arbitrary aircraft configuration or any three dimensional geometry. The basic surface element used for this fit is a bicubic surface patch. Once the geometry was replaced by a set of patch equations, various kinds of calculations which require a three dimensional mathematical description of the surface can be performed easily. The second part of the code generates orthographic views of the given geometry on a calcomp drum plotter or on a Tektronix screen. The last part of the program generates cross sectional plots at any desired orientation through the given configuration. Also this module can be used to generate cross sectional areas, intermediate sections and other geometric details of the given configuration. The input data is oriented mainly towards aircraft geometry. But the code can be efficiently used for representing any arbitrary surface or a combination of both. Author

**COVARIANCE SPECIFICATION FOR THE LINEAR TIME-INVARIANT OUTPUT-FEEDBACK CONTROL SYSTEMS USING A KALMAN FILTER**

M. NAGAYASU Oct. 1985 16 p refs In JAPANESE; ENGLISH summary

(NAL-TR-882; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

The covariance specification problem using a Kalman filter for the linear time-invariant output-feedback control system contaminated by observation and system noise is described. Linear stochastic control problems based on the quadratic performance criteria were studied. However, the relationships between the criteria and the behavior of the resultant closed loop system are still in question today. The optimal output-feedback control using a Kalman filter with which the stationary state covariance matrix coincides with the prescribed matrix is described. The system is disturbed by additive white/color system noise and the output signal is contaminated by white observation noise. The dynamic output feedback control system is obtained by using a Kalman filter. The covariance specification problem, i.e., to obtain the optimal feedback gains under the requirement of the state covariance coinciding with the prescribed covariance for minimizing the control effort, is solved. The control problem of an aircraft in atmospheric turbulence is numerically discussed. E.A.K.

**COMPUTATION OF TRANSFER FUNCTION MATRICES**

J. K. SRIDHAR and B. SATYABHAGAVAN Aug. 1985 30 p refs

(NAL-TM-SE-8509) Avail: NTIS HC A03/MF A01

Control systems design in frequency domain involves the computation of transfer function matrices. Details of the software developed on UNIVAC-1100/60 to compute transfer function matrices and hence zeros and poles of numerator and denominator polynomials respectively are given. The software developed here is intended to form an integral part of a package available in the division to study longitudinal and lateral dynamics of an aircraft. Numerical algorithm and schematic flow chart is presented along with an example on a fighter aircraft model. The software is documented and validated. A user manual is provided. Author

**APPLICATION OF PRA TO HEMP VULNERABILITY ANALYSIS**

R. W. MENSING Sep. 1985 57 p

(Contract W-7405-ENG-48)

(DE86-001781; UCID-20553) Avail: NTIS HC A04/MF A01

Vulnerability analyses of large systems, e.g., control and communication centers, aircraft, ships, are subject to many uncertainties. A basic source of uncertainty is the random variation inherent in the physical world. Thus, vulnerability is appropriately described by an estimate of the probability of survival (or failure). The estimate of the probability of survival is not a single value but a range of values. Probabilistic risk analysis (PRA) is a methodology which deals with these uncertainty issues. This report discusses the application of PRA to HEMP vulnerability analyses. Vulnerability analysis and PRA are briefly outlined and the need to distinguish between random variation and modeling uncertainty is discussed. Then a sequence of steps appropriate for applying PRA to vulnerability problems is outlined. Finally, methods for handling modeling uncertainty are identified and discussed. DOE

**DATA REDUCTION, MANAGEMENT, AND ANALYSIS SOFTWARE FOR CID**

C. W. DAVIS *In* NASA. Langley Research Center Full-Scale Transport Controlled Impact Demonstration p 61-77 Jan. 1986 refs

Avail: NTIS HC A16/MF A01 CSCL 20K

In an overview of the Data Reduction System, three major steps are examined. First, the raw data tapes were selected from the onboard recorders. These tapes should provide the best quality data for the data reduction software system. These tapes contained 352 channels of data, plus the monitor channels recorded in 8 bit Pulsed Coded Modulation (PCM) words. The next step consists of transcribing the PCM tapes from 8 bit serial digital data to 8 bit parallel digital data. This puts the data in the correct format for processing. The transcription process was accomplished here at LaRC in the Central Data Transportation Facility (CDTF). The last step in this 3 step process is to process the data through the reduction system developed for the Impact Dynamic Research Facility in the early part of 1980. Processing system criteria, system interface routines, and engineering units program that reads digitized data from tapes, and file management programs are discussed. R.J.F.

**DIGITAL FILTERING AND ACCELERATION PULSE INTERPRETATION**

E. L. PASANELLA *In* NASA. Langley Research Center Full-Scale Transport Controlled Impact Demonstration p 103-123 Jan. 1986 refs

Avail: NTIS HC A16/MF A01 CSCL 12A

It was concluded that the post processing digital filter is quite effective for removing unwanted high frequency and noise without distorting the signal. In addition, digital filtering is effective for smoothing low-level low resolution digital data where the digital stairstep phenomena are pronounced. Integrating the acceleration data to obtain velocity traces is quite useful. The velocity change provides a check on the validity of the acceleration trace. (Zero offsets in acceleration must be removed before integrating.) Average accelerations can be obtained from the velocity trace by dividing the change in velocity for an acceleration pulse by the pulse duration. One can obtain the peak of an equivalent triangular pulse by doubling the average acceleration. Author

**SELECTION OF A MAN-MODELLING CAD (COMPUTER-AIDED DESIGN)**

P. L. ROTHWELL Sep. 1985 22 p

(AD-A161342; DCIEM-85-C-36) Avail: NTIS HC A02/MF A01 CSCL 09B

DCEIM has been tasked to review Canadian Forces (CF) aircrew/cockpit compatibility and to make recommendations regarding future aircrew selection standards. Computer man-modelling has been proposed as the method to address the evaluation. In this report, three potential computer-aided design, man-modelling programs (CAR, COMBIMAN and SAMMIE) are evaluated. The ELECTRE multi-criteria decision making process was used to select the most appropriate program. The criteria were based on man-modelling and workspace-modelling features, and the capabilities to address the problems of reach, clearance and vision in aircraft crew stations. The results of the analysis support the recommendation to procure SAMMIE. SAMMIE was also found to be suitable to other work station design applications. GRA

**MOTION PLANNING IN THE PRESENCE OF MOVING OBSTACLES**

J. H. REIF and M. SHARIR 1985 30 p

(Contract N00014-80-C-0647)

(AD-A161374; TR-06-85) Avail: NTIS HC A03/MF A01 CSCL 12A

This paper investigates the computational complexity of planning the motion of a body B in 2-D or 3-D space, so as to avoid collision with moving obstacles of known, easily computed, trajectories. Dynamic movement problems are of fundamental importance to robotics, but their computational complexity has not previously been investigated. We provide evidence that the 3-D dynamic movement problem is intractable even if B has only a constant number of degrees of freedom of movement. In particular, we prove the problem is PSPACE-hard if B is given a velocity modulus bound on its movements and is NP hard even if B has no velocity modulus bound, where in both cases B has 6 degrees of freedom. To prove these results we use a unique method of simulation of a Turing machine which uses time to encode configurations (whereas previous lower bound proofs in robotics used the system position to encode configurations and so required unbounded number of degrees of freedom). We also investigate a natural class of dynamic problems which we call asteroid avoidance problems: B, the object we wish to move, is a convex polyhedron which is free to move by translation with bounded velocity modulus and the polyhedral obstacles have known translational trajectories but cannot rotate. This problem has many applications to robot, automobile, and aircraft collision avoidance. GRA

**APPLICATION OF THE FINITE ELEMENT METHOD IN THE CALCULATION OF TRANSMISSION LOSS OF FLAT AND CURVED PANELS**

L. R. KOVAL, S. MOTAMEDI, and J. V. RAMAKRISHNAN (Missouri-Rolla, University, Rolla) IN: Fluid-structure interaction and aerodynamics damping; Proceedings of the Tenth Biennial Conference on Mechanical Vibration and Noise, Cincinnati, OH, September 10-13, 1985 . New York, American Society of Mechanical Engineers, 1985, p. 19-28. refs

(Contract NAG1-240)

This investigation represents an extension of a study of Roussos (1985) who considered the noise transmission loss of a rectangular plate in an infinite baffle. Roussos, who employed an analytical formulation, considered an unstiffened plate. While it is difficult to consider stiffeners by means of analytical methods, the difficulties can be avoided by employing a finite element procedure. For this reason, the present study is concerned with the implementation of a finite element method. The representation of the panel transmission loss is discussed, and the determination of the panel motion by means of the finite element technique is described, taking into account an isotropic flat panel, the exciting force, an eigenvalue problem, the radiation pressure, a plate element, and a cylindrical shell element. Numerical results are considered for a flat panel, a curved panel, and a stiffened flat panel. G.R.

**HELICOPTER MODEL ROTOR-BLADE VORTEX INTERACTION IMPULSIVE NOISE - SCALABILITY AND PARAMETRIC VARIATIONS**

D. A. BOXWELL, F. H. SCHMITZ (NASA, Ames Research Center, U.S. Army, Aeromechanics Laboratory, Moffett Field, CA), W. R. SPLETTSTOESSER, and K. J. SCHULTZ (DFVLR, Institut fuer Entwurfsaerodynamik, Brunswick, West Germany) (Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984) IN: International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings . Alexandria, VA, American Helicopter Society, 1985, 19 p. Previously announced in STAR as N85-16826. refs

Acoustic data taken in the anechoic Deutsch-Niederlaendischer Windkanal (DNW) have documented the blade vortex interaction (BVI) impulsive noise radiated from a 1/7-scale model main rotor of the AH-1 series helicopter. Averaged model scale data were compared with averaged full scale, inflight acoustic data under similar nondimensional test conditions. At low advance ratios (mu = 0.164 to 0.194), the data scale remarkable well in level and waveform shape, and also duplicate the directivity pattern of BVI impulsive noise. At moderate advance ratios (mu = 0.224 to 0.270), the scalig deteriorates, suggesting that the model scale rotor is not adequately simulating the full scale BVI noise; presently, no proved explanation of this discrepancy exists. Carefully performed parametric variations over a complete matrix of testing conditions have shown that all of the four governing nondimensional parameters - tip Mach number at hover, advance ratio, local inflow ratio, and thrust coefficient - are highly sensitive to BVI noise radiation. E. BOOTH, JR. and J. C. YU Mar. 1986 27 p refs
(NASA-TP-2551; L-15981; NAS 1.60:2551) Avail: NTIS HC A03/MF A01 CSCL 20A

An experimental investigation of two dimensional blade vortex interaction was held at NASA Langley Research Center. The first phase was a flow visualization study to document the approach process of a two dimensional vortex as it encountered a loaded blade model. To accomplish the flow visualization study, a method for generating two dimensional vortex filaments was required. The numerical study used to define a new vortex generation process and the use of this process in the flow visualization study were documented. Additionally, photographic techniques and data analysis methods used in the flow visualization study are examined. Author

R. C. PAYNE Aug. 1985 50 p refs
(NPL-AC-104; ISSN-0143-7143) Avail: Issuing Activity

Sound pressure levels measured using ground-plane microphone configurations are compared with pressure-doubled spectra derived from measurements using a conventional 1.2 m microphone location. Experimental data were obtained under laboratory conditions and in the field using a stationary sound source producing pure tone signals or shaped white noise. An arrangement involving a half-inch condenser microphone inverted over a circular baffle gives a close approximation to a pressure-doubled spectrum. Field trials using over-flights of light propeller-driven aircraft confirm the validity of the arrangement. Author (ESA)

A guide for the use of the Airport-Noise Level and Annoyance MOdel (ALAMO) at the Langley Research Center computer complex is provided. This document is divided into 5 primary sections, the introduction, the purpose of the model, and an in-depth description of the following subsystems: baseline, noise reduction simulation and track analysis. For each subsystem, the user is provided with a description of architecture, an explanation of subsystem use, sample results, and a case runner's check list. It is assumed that the user is familiar with the operations at the Langley Research Center (LaRC) computer complex, the Network Operating System (NOS 1.4) and CYBER Control Language. Incorporated within the ALAMO model is a census database system called SITE II. Author

**AN EVALUATION OF STUDY DESIGN FOR ESTIMATING A TIME-OF-DAY NOISE WEIGHTING**
J. M. FIELDS Mar. 1986 30 p refs
(Contract NAS1-16978)
(NASA-CR-178062; NAS 1.26:178062) Avail: NTIS HC A03/MF A01 CSCL 20A

The relative importance of daytime and nighttime noise of the same noise level is represented by a time-of-day weight in noise annoyance models. The high correlations between daytime and nighttime noise were regarded as a major reason that previous social surveys of noise annoyance could not accurately estimate the value of the time-of-day weight. Study designs which would reduce the correlation between daytime and nighttime noise are described. It is concluded that designs based on short term variations in nighttime noise levels would not be able to provide valid measures of response to nighttime noise. The accuracy of the estimate of the time-of-day weight is predicted for designs which are based on long term variations in nighttime noise levels. For these designs it is predicted that it is not possible to form satisfactorily precise estimates of the time-of-day weighting. Author

**RADIONAVIGATION PLANNING IN THE FAA**
N. A. BLAKE and J. W. BRADLEY (FAA, Washington, DC) IN: Institute of Navigation, National Technical Meeting, San Diego, CA, January 15-17, 1985, Proceedings . Washington, DC, Institute of Navigation, 1985, p. 5-17.

A review of the development and automation of the FAA's air traffic control process, in addition to its program for the future, is presented. The very high frequency omnidirectional radio range (VOR) in use since 1946 and updated to solid-state capability, and its distance measuring equipment (DME), constitute the primary civil air radio navigation systems today, and are projected to remain so into the next century. The system is supplemented by LORAN-C for low altitudes and offshore areas, and OMEGA and INS for oceanic and domestic high altitude airspace to meet all current user requirements including direct and random fuel efficient operation throughout much of the upper airspace. The Global Positioning System (GPS) may meet the requirements either as a sole-means or a supplementary navigation system in the future, accompanied by the possible phasing-out of existing supplementary systems. The military, however, plan to replace their tactical air navigation system (TACAN) with the GPS during the 1990s. R.R.

**SOFTWARE MANAGEMENT FOR INTEGRATED AVIONICS SYSTEMS**
K. C. EDWARDS (Harris Corp., Government Aerospace Systems Div., Melbourne, FL) IN: NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volume 1 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 798-805. refs

Software engineering methodologies providing the level of control necessary to achieve cost effective software development for an integrated avionics software system are discussed with particular reference to the integrated software system for the Agusta A-129 Light Attack Helicopter. The high level of control is required to maintain the functional independence of the different software elements (e.g., Automated Flight Controls, Engine Monitor, Operator Interface, Navigation, and others) in order to avoid unnecessary couplings that will drive the cost of the system development and maintenance up while reducing the reliability of the system. As a result of an implementation of this approach, the software development costs for the Agusta A-129 project have been comparable to less complex ground-based systems. V.L.

**A METHODOLOGY FOR APPLYING BAR CODE TECHNOLOGY TO AIRCRAFT MAINTENANCE UNIT SUPPORT SECTIONS M.S. Thesis**
P. VALOVCIN Sep. 1985 97 p
(AD-A161783; AFIT/GLM/LSM/85S-79) Avail: NTIS HC A05/MF A01 CSCL 09B

This study developed a methodology that decision makers can use as an aid to determine if bar code technology should be applied in Aircraft Maintenance Unit (AMU) Support Sections. The literature review revealed that the Logistics Applications of Automated Marking and Reading Symbols (LOGMARS) steering group recommended that bar code technology applications be aggressively pursued across the logistics spectrum due to the success of the LOGMARS test program. Since AMU support sections perform many functions similar to those that have already benefited form this technology as it applies to an AMU support sections. Worksheets were designed to help collect and analyze the necessary cost/benefit information so that decision makers will be able to properly assess the expected cost and benefits for a particular support section. **THE GOLDEN AGE OF THE GREAT PASSENGER AIRSHIPS: GRAF ZEPPELIN AND HINDENBURG**
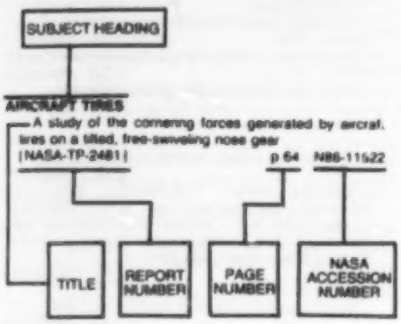
H. G. DICK and D. H. ROBINSON Washington, DC, Smithsonian Institution Press, 1985, 226 p. refs

The history of commercial airship operations in Germany during the 1920s and 1930s is reviewed, in an anecdotal style. Emphasis is given to the personal reminiscences of an American airship designer on board the Graf Zeppelin and the Hindenburg during several transatlantic crossings. A description of the Hindenburg disaster at Lakehurst, New Jersey, on May 6, 1937, is presented. Some of the political and economic factors which led to the abandonment of commercial airship transportation are discussed in detail. Original black and white photographs of the Hindenburg and the Graf Zeppelin are provided, as well as a glossary of airship terms and a verbatim reproduction of a German airship crew manual. I.H.

# SUBJECT INDEX

## Typical Subject Index Listing



SUBJECT HEADING
AIRCRAFT TIRES
A study of the cornering forces generated by aircraft tires on a tilted, free-swiveling nose gear
[NASA-TP-2481] p 64 N86-11522
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

[NASA-TP-2447] p 339 N86-20345
Installation effects of long-duct pylon-mounted nacelles on a twin-jet transport model with swept supercritical wing
[NASA-TP-2457] p 339 N86-20346

**AERODYNAMIC LOADS**
Semi-empirical simulation of steady and unsteady rotor blade aerodynamic loading p 336 A86-27656

**AERODYNAMIC STABILITY**
Side force characteristics of a 20 deg cone at high angles of attack
[NAL-TM-AE-8503] p 340 N86-20356
Operation REDWING, Project 5.2, in-flight participation of a B-52
[AD-A995286] p 357 N86-21536

**AERODYNAMIC STALLING**
Computation of three dimensional potential flow around a finite wing with a leading-edge discontinuity at high angle of attack p 341 N86-21504

Effects of wing modification on an aircraft's aerodynamic parameters as determined from flight data
[NASA-TM-87591] p 370 N86-21550

AERODYNAMICS
BASIC aerodynamics --- Book p 336 A86-26474
Transonic flow calculations for aircraft p 336 A86-29474
Aerodynamics. Part 1 - Fundamentals of theory. Aerodynamics of an airfoil and a wing --- Book p 336 A86-29840
Aerodynamics. Part 2 - Methods of aerodynamic calculations p 336 A86-29841

AEROELASTICITY
Application of modern structural optimization to vibration reduction in rotorcraft p 352 A86-26587
Mathematical models for studying aircraft vibrations with allowance for structural hysteresis p 38[illegible] A86-27081
Aeroelastic tailoring study in aircraft design p 383 A86-27741
Rotating aerodynamic exciters for in-flight flutter testing p 353 A86-27820
Dynamic stability of elastic structures under random influences p 384 A86-28318
Steady and unsteady transonic pressure distributions on NACA 0012 p 337 A86-28565
Linear and nonlinear model analysis of aeroelastic structural systems p 387 A86-28742
Aeroelasticity at the NASA Langley Research Center Recent progress, new challenges
[NASA-TM-87660] p 336 N86-20342

AEROSPACE ENGINEERING
Experimental system identification for experimental/analytical correlation and modelling p 381 A86-26883
NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volumes 1 & 2 p 348 A86-28326
Japan report: Science and technology
[JPRS-JST-86-001] p 389 N86-21723

AEROSPACE INDUSTRY
Conference on Steels and Special Alloys in Aeronautics, 11th, Le Bourget, France, June 6, 1985, Proceedings p 372 A86-26326
Recycling of titanium scrap for the production of high-duty aerospace components p 382 A86-27211
New aramid developments for aerospace/aircraft applications p 377 A86-27759

AEROSPACE SYSTEMS
Advances in aerospace structural analysis; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 387 A86-28651

AEROSPACE VEHICLES
Variable control policies for future aerospace vehicles p 367 A86-28386
Aeroelasticity at the NASA Langley Research Center Recent progress, new challenges
[NASA-TM-87660] p 336 N86-20342

AFTERBODIES
Jet plume temperature effects on afterbody pressure distribution and drag
[NAL-TM-FM-8502] p 340 N86-20354

AFTERBURNING
High frequency-heated air turbojet
[NASA-TM-77710] p 364 N86-21543

AGRICULTURAL AIRCRAFT
Vertically operating flight vehicle for drilling and agricultural use
[NASA-TM-77713] p 357 N86-21535

AIR DATA SYSTEMS
High stability pressure transducers for air data systems and test sets p 359 A86-28362
A novel primary air data quality pressure transducer p 359 A86-28363
Wind tunnel calibration of a flow direction sensor and a pilot-static tube to high angles of attack and sideslip p 359 A86-28364

AIR DEFENSE
Path-finder - An hueristic approach to aircraft routing p 368 A86-26499

AIR DROP OPERATIONS
Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS system
[DE85-017614] p 341 N86-20371

AIR FLOW
Numerical simulation of a controlled-flow tunnel for V/STOL testing p 371 A86-28561

AIR LAW
Ultralight aircraft - A need for better regulation than 14 C.F.R. Section 103 --- in air law p 343 A86-28000

AIR NAVIGATION
Radionavigation planning in the FAA p 402 A86-26427
Helicopter flight test demonstration of differential GPS p 345 A86-26438
Omega - Commercial experiences with a mature system p 345 A86-26442
Decentralization filtering and redundancy management/failure detection for multisensor integrated navigation systems p 346 A86-26443
Institute of Navigation, Annual Meeting, 41st, U.S. Naval Academy, Annapolis, MD, June 25-27, 1985, Proceedings p 346 A86-26501
Commercial aviation GPS Navigation Set flight test results p 346 A86-26507
A new system simultaneously covering en route navigation and landing p 348 A86-27898
Errare humanum est . . . sed perseverare diabolicum or navigation errors of the 747 and the 'heading' position p 348 A86-27900
A combined optimal algorithm for filtering and calculating navigation coordinates p 348 A86-28311
Reliability of aircraft navigation p 348 A86-28312
A distributed, fault-tolerant implementation of the airborne digital map using VLSI common programmable modules p 349 A86-28337
Navigation methodology - An investigation of an inertial navigation system (INS) enhancement p 349 A86-28356
JTIDS RELNAV performance evaluation --- Joint Tactical Information Distribution System in relative air navigation p 350 A86-28369
Interpolation of heights and slopes from a digital terrain elevation model
[BAE-BT-13198] p 352 N86-20382

AIR TRAFFIC
Production-theoretical study of air traffic output production --- German thesis p 402 A86-27834
Activities report of the aerospace industry in West Germany
[ISSN-0176-5086] p 403 N86-22450

AIR TRAFFIC CONTROL
Radionavigation planning in the FAA p 402 A86-26427
A procedure for the evaluation and analysis of the operational practicability and effectiveness of automated traffic flow control procedures for the near terminal area --- German thesis p 347 A86-27829
Flight mechanics contributions to the time-based trajectory control in the aircraft longitudinal plane --- German thesis p 348 A86-27852
A speech processing system for an air traffic control radar simulator p 351 A86-26447
A satellite system for aeronautical data communications
[AIAA PAPER 86-0602] p 351 A86-29578
Safety study: Ultraviolet vehicle accidents
[PB85-917001] p 343 N86-20377
The Stapleton microburst advisory service project: An operational viewpoint
[AD-A161543] p 394 N86-21078
Oversight on the Federal Aviation Administration fiscal year 1986 research, engineering and development budget request
[GPO-46-725] p 402 N86-21447

AIR TRANSPORTATION
Segmented tubular cushion springs and spring assembly
[NASA-CASE-ARC-11349-1] p 388 N86-20797

AIRBORNE EQUIPMENT
Omega - Commercial experiences with a mature system p 345 A86-26442
Frequency synthesis type airborne transmitters p 347 A86-27819
Accelerated testing as a means of ensuring the reliability of aircraft equipment p 335 A86-28306
Dynamic retraining approaches for an airborne speech recognition system p 395 A86-28444

AIRBORNE SURVEILLANCE RADAR
Detection of non-moving targets by airborne mm-wave radars p 351 A86-29783

AIRBORNE/SPACEBORNE COMPUTERS
The use of microcomputers in inertial navigation systems with strapdown sensors and for measurement systems of average accuracy --- German thesis p 347 A86-27849
A Modular Stress Management System (MSMS) with worldwide applications p 359 A86-28367
Implementation of TF/TA in the digital terrain management and display system p 359 A86-28390
Pilot/Vehicle Interface Design System (PIVIDS) p 361 A86-28512

AIRCRAFT ACCIDENT INVESTIGATION
Aircraft accident report: Air Canada Flight 797, McDonnell Douglas DC-9-32, C-FTLU Greater Cincinnati International Airport, Covington, Kentucky, June 2, 1983
[PB86-910402] p 344 N86-21525
Aircraft accident report: Galaxy Airlines, Inc., Lockheed Electra-L-188C, N5532, Reno, Nevada, January 21, 1985
[PB86-910401] p 344 N86-21526
Aircraft mishap fire pattern investigations
[AD-A161094] p 344 N86-21528

AIRCRAFT ACCIDENTS
Safety study: Ultraviolet vehicle accidents
[PB85-917001] p 343 N86-20377
Galley and overhead compartment experiment results: Full-scale transport controlled impact demonstration
[DOT/FAA/CT-85/33] p 343 N86-20378
Full-Scale Transport controlled Impact Demonstration
[NASA-CP-2395] p 390 N86-21933
CID overview p 390 N86-21934
CID flight/impact p 390 N86-21935
Controlled impact demonstration seat/cabin restraint systems: FAA p 390 N86-21937
Data reduction, management, and analysis software for CID p 399 N86-21938
NASA seat experiment and occupant responses p 390 N86-21939
Structural loads preliminary results p 391 N86-21940
Digital filtering and acceleration pulse interpretation p 400 N86-21941
Controlled impact demonstration flight data recorders/cockpit voice recorders p 391 N86-21944
United States Navy - Canadian forces solid state flight data recorder/crash position locator experiment on the B-720 controlled impact demonstration p 391 N86-21945

AIRCRAFT ANTENNAS
Aircraft coupling model evaluations at SHF/EHF p 346 A86-27126
Mechanical design and evaluation of a slotted CFRP waveguide antenna p 383 A86-27703

AIRCRAFT COMMUNICATION
The effects of atmospheric turbulence on an air-to-air optical communication link p 351 A86-28470
The development status of JTIDS dual mode TDMA and distributed TDMA (DTDMA) full scale development terminals - An update p 351 A86-28473
Improving intelligibility in audio distribution systems p 395 A86-28513
A satellite system for aeronautical data communications
[AIAA PAPER 86-0602] p 351 A86-29578

AIRCRAFT COMPARTMENTS
Galley and overhead compartment experiment results: Full-scale transport controlled impact demonstration
[DOT/FAA/CT-85/33] p 343 N86-20378
Recent experiences in the analysis of aircraft cabin noise p 401 N86-21287
Proceedings of Cabin Safety Conference and Workshop held on 11-14 December 1984
[AD-A160950] p 344 N86-21527
Controlled impact demonstration seat/cabin restraint systems: FAA p 390 N86-21937

AIRCRAFT CONFIGURATIONS
Aircraft of special configurations --- Russian book p 335 A86-28521
The joined wing - An overview --- aircraft tandem wings in diamond configurations p 355 A86-28559
Motion planning in the presence of moving obstacles
[AD-A161374] p 400 N86-22208

AIRCRAFT CONSTRUCTION MATERIALS
Conference on Steels and Special Alloys in Aeronautics 11th, Le Bourget, France, June 6, 1985, Proceedings p 372 A86-26326
New developments in the materials used in airliner, helicopter and spacecraft structures p 372 A86-26327
Development of materials used in landing gear p 373 A86-26329
Materials in thrust reversers p 373 A86-26332
The new aluminium alloys for the aeronautical industry p 373 A86-26334
The thermo-mechanical processing during closed die forging - A method of improving aeronautical materials p 380 A86-26336
The development of high strength stainless steels for the aeronautical industry p 373 A86-26337
Properties and potential aerospace applications of E Z 3 CNDA 13-08 steel. II p 374 A86-26338
Strength in adversity --- of aircraft construction materials p 335 A86-27020
Applications of titanium and titanium alloys p 374 A86-27202
Development in PM HHDH-Ti6Al4V technology for aircraft application --- High-quality Hydride Dehydriding Process p 375 A86-27224
Producibility of aircraft structural parts by superplastic forming and diffusion bonding p 382 A86-27272
EB repair welding of a critical aircraftpart made from the nonweldable titanium alloy 3.7184.7 (Ti-Al4-Mo4-Sn2-Si) p 382 A86-27278
Analytical and experimental studies of textile structural composites p 377 A86-27652

Structural materials in aeronautics: Prospects and perspectives
[RAE-TR-85077] p 357 N86-21532
NASA experiments on the B-720 structure and seats p 390 N86-21936

**AIRCRAFT CONTROL**
Flight mechanics contributions to the time-based trajectory control in the aircraft longitudinal plane --- German thesis p 348 A86-27852
Quantitative feedback design approach to pilot-in-the-loop analysis p 366 A86-28377
Multivariable control law design for the AFTI/F-16 with a failed control surface p 367 A86-28380
Variable control policies for future aerospace vehicles p 367 A86-28386
Design of direct digital flight-mode control systems for high-performance aircraft using step-response matrices p 367 A86-28387
Detection and isolation of control surface effectiveness failures in high performance aircraft p 367 A86-28392
An automatic redesign approach for restructurable control systems p 368 A86-28394
Digital fault tolerant flight actuation systems p 354 A86-28400
A survivable fly-by-wire spoiler actuation system featuring nonflammable fluid, 8,000 PSI hydraulics and direct drive valves p 355 A86-28402
An expert system for integrated aircraft/engine controls design p 355 A86-28405
Path-finder - An hueristic approach to aircraft routing p 368 A86-28499
Airplane automatic control force trimming device for asymmetric engine failures
[NASA-CASE-LAR-13280-1] p 369 N86-20397
Study on the digital position transducer with optical time-delay pulse
[NAL-TR-878] p 388 N86-20759
Propulsion and control propellers with thruster nozzles primarily for aircraft applications
[NASA-TM-77715] p 342 N86-21511

**AIRCRAFT DESIGN**
Materials in thrust reversers p 373 A86-26332
An engineering approach to the inverse transonic wing design problem p 338 A86-26409
Strength in adversity --- of aircraft construction materials p 335 A86-27020
Aeroelastic tailoring study in aircraft design p 383 A86-27741
ATRA42 - First of a family p 353 A86-28060
Light aircraft - The way ahead in design and operation; Proceedings of the Symposium, Loughborough, England, March 31, April 1, 1984 p 354 A86-28093
A robust 100 MBPS network for avionics applications p 385 A86-28341
High speed fiber optic data bus for avionics integration p 385 A86-28342
High speed bus for Pave Pillar applications p 385 A86-28343
Digital avionics for modern aircraft - A case study into the problems and promise of aircraft electronics p 358 A86-28346
A modeling structure for computer aided design p 397 A86-28403
2010 - The symbionic cockpit p 355 A86-28455
Multivariable control law design for the X-29 aircraft p 369 A86-28510
Aircraft of special configurations --- Russian book p 335 A86-28521
The joined wing - An overview --- aircraft tandem wings in diamond configurations p 355 A86-28559
Comparison of discrete and continuous gust methods for airplane design loads determination p 356 A86-28567
CAD/CAM supports flight test modifications p 356 A86-29823
Parametric Bi-cubic surface patch for computer aided geometric design of aircraft and/or other three-dimensional geometries
[NAL-TM-AE-8505] p 399 N86-21168
Comparison of computational results of a few representative three-dimensional transonic potential flow analysis programs
[NASA-TM-77963] p 341 N86-21509
Three-dimensional boundary layer analysis program Blay and its application
[NASA-TM-77962] p 342 N86-21516
Controlled impact demonstration seat/cabin restraint systems: FAA p 390 N86-21937

**AIRCRAFT ENGINES**
Will 1990s aircraft be powered by propfan or advanced turbofan? p 363 A86-26370
Propfan engine designs examined p 363 A86-26371
Electro-impulse de-icing of aircraft engine inlets
[AIAA PAPER 86-0546] p 352 A86-26647
Forced response analysis of an aerodynamically detuned supersonic turbomachine rotor p 363 A86-26902
The effect of limiting aerodynamic and structural coupling in models of mistuned bladed disk vibration p 363 A86-26905
Fatigue behaviour of titanium materials in aircraft engines p 375 A86-27275
Embrittled trailing edges of compressor blades (titanium alloy Ti6Al-4V and Ti6Al2Sn4Zr2Mo) of gas turbine aero-engines p 376 A86-27279
The strain controlled fatigue behaviour of a near-alpha titanium alloy p 376 A86-27383
Studies on crack growth rate of high temperature titanium alloys p 376 A86-27384
A loss of dynamic stability of the torsional vibrations of blades due to cascade flutter p 364 A86-27543
A unified method for evaluating the strength and reliability of the blades of the axial-flow compressors and gas turbines of aircraft engines p 364 A86-28317
Characteristics of the effect of the powerplant jet streams on the design of VTOL aircraft p 354 A86-28320
Power thyristor starter for aircraft engine p 386 A86-28373
IV&V for the automatic test control system in the USAF Aeropropulsion Systems Test Facility p 398 A86-28430
Ultrasonic liquid quantity measurement --- in oils p 360 A86-28478
Proceedings of the 1985 ONR/NAVAIR Wave Rotor Research and Technology Workshop
[AD-A161539] p 389 N86-20813
Structural materials in aeronautics: Prospects and perspectives
[RAE-TR-85077] p 357 N86-21532
Comparison of airborne data acquisition systems at ARL (Aeronautical Research Laboratories)
[AD-A161664] p 357 N86-21537

**AIRCRAFT EQUIPMENT**
High stability pressure transducers for air data systems and test sets p 359 A86-28362
A novel primary air data quality pressure transducer p 359 A86-28363
Electromechanical actuation reliability and survivability --- for flight control surface motion in military aircraft p 354 A86-28397
Electronics for advanced electromechanical actuators design considerations --- for flight control p 354 A86-28398
Unified EM transient protection requirements for aircraft avionics line replaceable units p 355 A86-28485
Piezoelectric deicing device
[NASA-CASE-LEW-13773-2] p 388 N86-20671
Aircraft interior panel test criteria derived from full-scale fire tests
[AD-A161637] p 345 N86-21529
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**AIRCRAFT FUEL SYSTEMS**
Control of a high-speed, brushless dc motor driven through a cycloconverter line --- for aircraft fuel pumps p 386 A86-28372

**AIRCRAFT FUELS**
Producibility and cost studies of aviation kerosene
[AGARD-AR-227] p 379 N86-20580
General aviation pilot and aircraft activity survey
[AD-A161665] p 345 N86-21530
Robotic refueling system for tactical and strategic aircraft
[AD-D011980] p 358 N86-21540
Development of LC-13C NMR
[NASA-CR-176656] p 379 N86-21704
Full-Scale Transport controlled Impact Demonstration
[NASA-CP-2395] p 390 N86-21933

**AIRCRAFT GUIDANCE**
Flight tests of MLS elevation guidance p 348 A86-27899
Autonomous landing guidance systems p 350 A86-28385
Algorithms for the automatic four-dimensional guidance of aircraft, taking into account the current wind situation
[ESA-TT-908] p 352 N86-21531

**AIRCRAFT HAZARDS**
Verification and application of the icing scaling equations
[AIAA PAPER 86-0481] p 343 A86-26640
Electromagnetic pulse test aircraft (EMPTAC) program p 335 A86-27145
The parallel-plate and rhombic EMP simulators - A summarizing review p 381 A86-27146
Knowledge engineering for a flight management expert system p 368 A86-28498
Measurements of the response of transport aircraft ceiling panels to fuel fires p 343 A86-28564
A numerical and experimental investigation of electrochemical aircraft deicing
[NASA-CR-175024] p 344 N86-20380

**AIRCRAFT HYDRAULIC SYSTEMS**
Microprocessor controlled and managed fly-by-wire hydraulic actuator p 368 A86-28401
A survivable fly-by-wire spoiler actuation system featuring nonflammable fluid, 8,000 PSI hydraulics and direct drive valves p 355 A86-28402

**AIRCRAFT INDUSTRY**
New aramid developments for aerospace/aircraft applications p 377 A86-27759

**AIRCRAFT INSTRUMENTS**
Errare humanum est . . . sed perseverare diabolicum or navigation errors of the 747 and the 'heading' position p 348 A86-27900
Colour design in aviation cartography p 358 A86-28066
A distributed, fault-tolerant implementation of the airborne digital map using VLSI common programmable modules p 349 A86-28337
Pilot/Vehicle Interface Design System (PIVIDS) p 361 A86-28512

**AIRCRAFT LANDING**
Microwave Landing System (MLS) p 346 A86-26444
Realtime piloted simulation investigation of helicopter flying qualities during approach and landing on nonaviation ships
[AIAA PAPER 86-0490] p 365 A86-26642
A new system simultaneously covering en route navigation and landing p 348 A86-27898
Microwave Landing System p 349 A86-28358
Autonomous landing guidance systems p 350 A86-28385
STALINS method for takeoff and landing trajectory measurements p 356 A86-28566
Thrust-vectored takeoff, landing, and ground handling of an airship p 343 A86-28571

**AIRCRAFT MAINTENANCE**
EB repair welding of a critical aircraftpart made from the nonweldable titanium alloy 3.7184.7 (Ti-Al4-Mo4-Sn2-Si) p 382 A86-27278
Remote aircraft maintenance monitoring using telemetry p 347 A86-27813
Reliability and maintenance of aircraft p 384 A86-28309
Optimum maintenance of aircraft systems on the basis of their condition with allowance for measurement errors p 354 A86-28310
Data systems for logistics evaluation during operational test p 398 A86-28483
Diagnosis - Using automatic test equipment and artificial intelligence expert systems --- for F-15 aircraft p 386 A86-28492
Development of a computerised method of determining aircraft maintenance intervals
[AD-A161339] p 336 N86-21500
A methodology for applying bar code technology to Aircraft Maintenance Unit support sections
[AD-A161783] p 402 N86-22441

**AIRCRAFT MANEUVERS**
Discrete maneuver flying qualities considerations in control system design p 366 A86-28378
Demonstration of an innovative technique for Terrain Following/Terrain Avoidance - The Dynapath Algorithm p 350 A86-28389
Multivariable control law design for the X-29 aircraft p 369 A86-28510

**AIRCRAFT MODELS**
Low-speed stability characteristics of a helicopter with a sling load p 365 A86-26586
A modeling structure for computer aided design p 397 A86-28403
Avoiding probe to model collisions in wind tunnel testing p 397 A86-28413
Lightning simulation tests on a graphite/epoxy airplane mockup p 355 A86-28514

**AIRCRAFT NOISE**
Helicopter model rotor-blade vortex interaction impulsive noise - Scalability and parametric variations p 400 A86-27658
Vibrations and structureborne noise in space station
[NASA-CR-176520] p 372 N86-20485
Noise levels for US certificated and foreign aircraft
[FAA-AC-36-1D] p 401 N86-21279
Recent experiences in the analysis of aircraft cabin noise p 401 N86-21287
The role of vibration and rattle in human response to helicopter noise
[AD-A162486] p 396 N86-22110
An experimental appraisal of the use of ground-plane microphones for aircraft noise measurement --- certification tests
[NPL-AC-104] p 401 N86-22302

Airport-Noise Levels and Annoyance Model (ALAMO) user's guide
[NASA-TM-87695] p 401 N86-22304
Airport-Noise Levels and Annoyance Model (ALAMO) system's reference manual
[NASA-TM-87694] p 401 N86-22305
An evaluation of study design for estimating a time-of-day noise weighting
[NASA-CR-178062] p 401 N86-22306
Measurement of noise from airplanes traveling at heights 3500 to 6000m
[FFA-TI-AU-2168] p 401 N86-22312

**AIRCRAFT PARTS**
Titanium near net shape components for demanding airframe applications p 380 A86-26717
Applications of titanium and titanium alloys p 374 A86-27202
Engineer's Guide to Titanium Castings p 382 A86-27203
Recycling of titanium scrap for the production of high-duty aerospace components p 382 A86-27211
Aerodynamics of aircraft elements --- Russian book p 337 A86-28525
Aerodynamics. Part 2 - Methods of aerodynamic calculations p 338 A86-29841

**AIRCRAFT PERFORMANCE**
JTIDS RELNAV performance evaluation --- Joint Tactical Information Distribution System in relative air navigation p 350 A86-28369
Real-time circle generation for raster displays --- computer graphics for aircraft displays p 361 A86-28511
STALINS method for takeoff and landing trajectory measurements p 356 A86-28566
Modal analysis of a typical fighter aircraft using transient testing technique
[NAL-TM-ST-8517] p 356 N86-20385

**AIRCRAFT PILOTS**
Expert systems for real time applications p 398 A86-28486
Knowledge engineering for a flight management expert system p 368 A86-28498

**AIRCRAFT POWER SUPPLIES**
Multivoltage high power electrical power system p 386 A86-28376
Diagnosis - Using automatic test equipment and artificial intelligence expert systems --- for F-15 aircraft p 386 A86-28492
Aircraft electrical power systems p 364 A86-28508
Solar powered vehicle may fly year-long missions p 356 A86-29824
Controlled impact demonstration on-board (interior) photographic system p 392 N86-21946

**AIRCRAFT PRODUCTION**
Requirements for recycling of valuable chips from and for aircraft manufacturing p 374 A86-27209

**AIRCRAFT RELIABILITY**
Flight Test Instrumentation System FTIS for type-certification of the Indonesian aircraft CN 235 p 358 A86-27818
Helicopter Airworthiness Symposium, 19th, London, England, December 19, 1984, Proceedings p 354 A86-28281
Problems of aircraft reliability p 383 A86-28303
Accelerated testing as a means of ensuring the reliability of aircraft equipment p 335 A86-28306
Control of the flight testing of aircraft as a means of increasing their reliability p 397 A86-28307
Reliability and maintenance of aircraft p 384 A86-28309
Reliability of aircraft navigation p 348 A86-28312
The effect of changes in the static strength of a structure during service on the reliability of aircraft p 384 A86-28322
Electromechanical actuation reliability and survivability --- for flight control surface motion in military aircraft p 354 A86-28397

**AIRCRAFT SAFETY**
Structural impact and crashworthiness; Proceedings of the International Conference, Imperial College of Science and Technology, London, England, July 16-20, 1984. Volume 1 Keynote Lectures. Volume 2 - Conference Papers p 383 A86-28276
Obstruction marking and lighting
[AC-70/7460-1G] p 371 N86-20410
Aircraft accident report: Galaxy Airlines, Inc., Lockheed Electra-L-188C, N5532, Reno, Nevada, January 21, 1985
[PB86-910401] p 344 N86-21526
Proceedings of Cabin Safety Conference and Workshop held on 11-14 December 1984
[AD-A160950] p 344 N86-21527
Aircraft mishap fire pattern investigations
[AD-A161094] p 344 N86-21528

**AIRCRAFT STABILITY**
Direct derivative measurements in the presence of sting plunging p 371 A86-28560
Effects of wing modification on an aircraft's aerodynamic parameters as determined from flight data
[NASA-TM-87591] p 370 N86-21550

**AIRCRAFT STRUCTURES**
New developments in the materials used in airliner, helicopter and spacecraft structures p 372 A86-26327
Reliable nondestructive testing - The key to using weldments in critical fighter aircraft structure p 380 A86-26544
Application of modern structural optimization to vibration reduction in rotorcraft p 352 A86-26587
Strength in adversity --- of aircraft construction materials p 335 A86-27020
Mathematical models for studying aircraft vibrations with allowance for structural hysteresis p 365 A86-27081
The damping capacity of layered materials p 374 A86-27084
A study of the static post buckling behavior of composite sandwich plates p 383 A86-27653
S-2 glass fiber - Its role in military applications p 377 A86-27702
Aerospace applications of PMR polyimide composites p 377 A86-27730
Structural impact and crashworthiness; Proceedings of the International Conference, Imperial College of Science and Technology, London, England, July 16-20, 1984. Volume 1 Keynote Lectures. Volume 2 - Conference Papers p 383 A86-28276
Reliability of the plates and shells of aircraft p 384 A86-28314
Problems in the dynamics of aircraft structures exposed to intensive acoustic loading p 384 A86-28316
The life of reinforced thin-walled structures in a random force field p 384 A86-28319
Problems in the stability and dynamics of aircraft structures with physicomechanical singularities p 384 A86-28321
Measurements of the response of transport aircraft ceiling panels to fuel fires p 343 A86-28564
Numerical synthesis of tri-variate velocity realizations of turbulence p 387 A86-28654
Linear and nonlinear model analysis of aeroelastic structural systems p 387 A86-28742
Strength analysis of flight vehicles --- Russian book p 356 A86-29842
Aeroelasticity at the NASA Langley Research Center Recent progress, new challenges
[NASA-TM-87660] p 336 N86-20342
Modal analysis of a typical fighter aircraft using transient testing technique
[NAL-TM-ST-8517] p 356 N86-20385
The 1-(diorganooxphosphonyl)methyl-2, 4- and -2, 6-dinitro and diamino benzenes and their derivatives
[NASA-CASE-ARC-11425-2] p 378 N86-20499
Development of a computerised method of determining aircraft maintenance intervals
[AD-A161339] p 336 N86-21500
Aircraft interior panel test criteria derived from full-scale fire tests
[AD-A161637] p 345 N86-21529
Structural materials in aeronautics: Prospects and perspectives
[RAE-TR-85077] p 357 N86-21532
Beam dampers for skin vibration and noise reduction in the 747 p 389 N86-21917
Integrated damped fuselage structure p 389 N86-21918
Full-Scale Transport controlled Impact Demonstration
[NASA-CP-2395] p 390 N86-21933
CID overview p 390 N86-21934
NASA experiments on the B-720 structure and seats p 390 N86-21936
Structural loads preliminary results p 391 N86-21940
Preliminary floor, seat, and dummy data p 391 N86-21942
CID-720 aircraft high-environment flight instrumentation system p 392 N86-21947
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**AIRCRAFT SURVIVABILITY**
Electromechanical actuation reliability and survivability -- for flight control surface motion in military aircraft p 354 A86-28397
Integrated communication, navigation, and identification avionics: Impact analysis. Executive summary
[AD-A161799] p 388 N86-20658

**AIRCRAFT TIRES**
Rubber removal specification development
[FAA/PM-85/33] p 371 N86-21555
Runway rubber removal specification development
[DOT/FAA/PN-85/33] p 372 N86-21556

Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**AIRFOIL PROFILES**
Steady and unsteady transonic pressure distributions on NACA 0012 p 337 A86-28565

**AIRFOILS**
An engineering approach to the inverse transonic wing design problem p 336 A86-26409
Aerodynamics. Part 1 - Fundamentals of theory. Aerodynamics of an airfoil and a wing --- Book p 338 A86-29840
The application to airfoils of a technique for reducing orifice-induced pressure error at high Reynolds numbers
[NASA-TP-2537] p 339 N86-20351
Computation of three dimensional potential flow around a finite wing with a leading-edge discontinuity at high angle of attack p 341 N86-21504
A viscous-inviscid interaction method to predict the aerodynamic performance of airfoils at transonic speed
[NAL-TR-873] p 341 N86-21506

**AIRFRAME MATERIALS**
What does the future hold for 1990's new airframe materials p 373 A86-26328
Advanced structural components by SPF/DB processing --- superplastic forming and diffusion bonding p 363 A86-27271
Fatigue properties of Ti-10V-2Fe-03Al p 375 A86-27274

**AIRFRAMES**
Titanium near net shape components for demanding airframe applications p 380 A86-26717
Model test requirements for coupled structure analysis using experimentally-derived component models p 380 A86-26878
Optimal airframe synthesis for gust loads
[NASA-CR-178047] p 357 N86-20386
Use of skin damping treatments to control airframe dynamic response for interior noise control p 389 N86-21919
Controlled impact demonstration airframe bending bridges p 391 N86-21943
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**AIRLINE OPERATIONS**
Production-theoretical study of air traffic output production --- German thesis p 402 A86-27834
Activities report of the aerospace industry in West Germany
[ISSN-0176-5066] p 403 N86-22450

**AIRPORT PLANNING**
General aviation pilot and aircraft activity survey
[AD-A161665] p 345 N86-21530

**AIRPORTS**
The Stapleton microburst advisory service project: An operational viewpoint
[AD-A161543] p 394 N86-21078
Aircraft accident report: Air Canada Flight 797, McDonnell Douglas DC-9-32, C-FTLU Greater Cincinnati International Airport, Covington, Kentucky, June 2, 1983
[PB86-910402] p 344 N86-21525
Weather radar studies
[AD-A161622] p 394 N86-22061
Airport-Noise Levels and Annoyance Model (ALAMO) user's guide
[NASA-TM-87695] p 401 N86-22304
Airport-Noise Levels and Annoyance Model (ALAMO) system's reference manual
[NASA-TM-87694] p 401 N86-22305

**AIRSHIPS**
The golden age of the great passenger airships: Graf Zeppelin and Hindenburg --- Book p 403 A86-27648
Thrust-vectored takeoff, landing, and ground handling of an airship p 343 A86-28571
Dirigible airships for Martian surface exploration
[AAS 84-176] p 372 A86-28802

**AIRSPEED**
Analysis of aerodynamic coefficients using gradient data: Spanwise turbulence effects on airplane response
[NASA-CR-3961] p 393 N86-21069

**ALGORITHMS**
Design issues in data synchronous systems p 362 N86-20407
Algorithms for the automatic four-dimensional guidance of aircraft, taking into account the current wind situation
[ESA-TT-908] p 352 N86-21531

**ALL-WEATHER LANDING SYSTEMS**
Microwave Landing System (MLS) p 346 A86-26444
Autonomous landing guidance systems p 350 A86-28385

**ALTITUDE**
A constant altitude flight survey method for mapping atmospheric ambient pressures and systematic radar errors p 360 A86-28507

**ALUMINUM ALLOYS**

The new aluminium alloys for the aeronautical industry p 373 A86-26334

Strength profile in Al-Li plate material p 374 A86-27198

Structural evaluation of superplastic aluminum. Part 1. Mechanical, corrosion, metallurgical data [AD-A161366] p 379 N86-21662

**ANGLE OF ATTACK**

Exploratory low-speed wind-tunnel study of concepts designed to improve aircraft stability and control at high angles of attack [NASA-CR-176615] p 338 N86-20344

Research on the aerodynamic characteristics of vehicles by free flight testing at supersonic speeds [NAL-TR-876] p 339 N86-20353

Side force characteristics of a 20 deg cone at high angles of attack [NAL-TM-AE-8503] p 340 N86-20356

Analysis of aerodynamic coefficients using gradient data: Spanwise turbulence effects on airplane response [NASA-CR-3961] p 393 N86-21069

Computation of three dimensional potential flow around a finite wing with a leading-edge discontinuity at high angle of attack p 341 N86-21504

Theoretical and experimental investigations of flow vector measurements with angle-of-attack and sideslip sensors on DFVLR meteorological research aircraft [DFVLR-FB-85-50] p 358 N86-21541

STEP and STEPSPL: Computer programs for aerodynamic model structure determination and parameter estimation [NASA-TM-86410] p 370 N86-21549

**ANTENNA DESIGN**

Mechanical design and evaluation of a slotted CFRP waveguide antenna p 383 A86-27703

Design considerations for Doppler VOR ground station antenna arrangement p 349 A86-28360

**ANTIMISTING FUELS**

Full-Scale Transport controlled Impact Demonstration [NASA-CP-2395] p 390 N86-21933

**ANTISUBMARINE WARFARE**

Flight testing of an ASW helicopter p 352 A86-26585

**ANTONOV AIRCRAFT**

AN-30 photography airplane outfitted for cloud-seeding missions p 393 N86-20888

**APPROACH CONTROL**

Realtime piloted simulation investigation of helicopter flying qualities during approach and landing on nonaviation ships [AIAA PAPER 86-0490] p 365 A86-26642

**APPROPRIATIONS**

Oversight on the Federal Aviation Administration fiscal year 1986 research, engineering and development budget request [GPO-46-725] p 402 N86-21447

**ARCHITECTURE (COMPUTERS)**

Data-driven operating concepts for real-time simulation systems p 397 A86-28348

Modular simulators - A comprehensive unified architecture --- for flight training p 371 A86-28458

Fault Tolerant Hardware/Software Architecture for Flight Critical Function [AGARD-LS-143] p 369 N86-20399

Introduction to Lecture Series No. 143: Fault tolerant hardware/software architectures for flight critical functions p 369 N86-20400

Digital fly-by-wire experience p 361 N86-20401

Dependable avionic data transmission p 362 N86-20405

Design issues in data synchronous systems p 362 N86-20407

Design validation of fly-by-wire flight control systems p 362 N86-20409

**ARMED FORCES (UNITED STATES)**

Development of a computerised method of determining aircraft maintenance intervals [AD-A161339] p 336 N86-21500

**AROMATIC COMPOUNDS**

Life prediction for aromatic polyamide reinforcements p 377 A86-27691

**ARTIFICIAL INTELLIGENCE**

Expert systems for real time applications p 396 A86-28486

Diagnosis - Using automatic test equipment and artificial intelligence expert systems --- for F-15 aircraft p 386 A86-28492

Path-finder - An hueristic approach to aircraft routing p 368 A86-28499

The Crew Station Information Manager - An avionics expert system p 361 A86-28515

**ARTIFICIAL SATELLITES**

Japan report: Science and technology [JPRS-JST-86-001] p 389 N86-21723

**ASPHALT**

Evaluation of the FAA design procedures for high traffic volume pavements [DOT/FAA/PM-84/14] p 352 N86-20383

**ASSEMBLIES**

Development of a computerised method of determining aircraft maintenance intervals [AD-A161339] p 336 N86-21500

**ASTEROIDS**

Motion planning in the presence of moving obstacles [AD-A161374] p 400 N86-22208

**ASTRIONICS**

NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volumes 1 & 2 p 348 A86-28326

**ASYMMETRY**

Matrix equations of the spatial flight of an asymmetrical rigid body p 365 A86-27446

Side force characteristics of a 20 deg cone at high angles of attack [NAL-TM-AE-8503] p 340 N86-20356

Asymmetric thrust warning system for dual engine aircraft [AD-D011960] p 361 N86-20387

**ATMOSPHERIC OPTICS**

The effects of atmospheric turbulence on an air-to-air optical communication link p 351 A86-28470

**ATMOSPHERIC PRESSURE**

A constant altitude flight survey method for mapping atmospheric ambient pressures and systematic radar errors p 360 A86-28507

**ATMOSPHERIC TURBULENCE**

The effects of atmospheric turbulence on an air-to-air optical communication link p 351 A86-28470

Numerical synthesis of tri-variate velocity realizations of turbulence p 387 A86-28654

Covariance specification for the linear time-invariant output-feedback control systems using a Kalman filter [NAL-TR-882] p 399 N86-21219

**AUDIO EQUIPMENT**

Improving intelligibility in audio distribution systems p 395 A86-28513

**AUDITORY SIGNALS**

Auditory signals in military aircraft - Ergonomic principles versus practice p 395 A86-28442

**AUTOMATIC CONTROL**

A procedure for the evaluation and analysis of the operational practicability and effectiveness of automated traffic flow control procedures for the near terminal area --- German thesis p 347 A86-27829

Airplane automatic control force trimming device for asymmetric engine failures [NASA-CASE-LAR-13280-1] p 369 N86-20397

**AUTOMATIC FLIGHT CONTROL**

Performance of a commercial transport under typical MLS noise environment [NASA-CR-178032] p 352 N86-20384

**AUTOMATIC LANDING CONTROL**

Microwave Landing System p 349 A86-28358

Algorithms for the automatic four-dimensional guidance of aircraft, taking into account the current wind situation [ESA-TT-908] p 352 N86-21531

**AUTOMATIC PILOTS**

An expert planner for the dynamic flight environment p 368 A86-28490

**AUTOMATIC TEST EQUIPMENT**

IV&V for the automatic test control system in the USAF Aeropropulsion Systems Test Facility p 398 A86-28430

Diagnosis - Using automatic test equipment and artificial intelligence expert systems --- for F-15 aircraft p 386 A86-28492

CAD/CAM supports flight test modifications p 356 A86-29823

**AUTOMATION**

Expert system applications to the cockpit of the '90s p 399 A86-28487

**AUTONOMOUS NAVIGATION**

Autonomous landing guidance systems p 350 A86-28385

**AUTOREGRESSIVE PROCESSES**

Numerical synthesis of tri-variate velocity realizations of turbulence p 387 A86-28654

**AUTOROTATION**

Helicopter performance computer programs for HP-41 hand-held computer [AD-A162794] p 358 N86-21539

**AVIONICS**

Decentralization filtering and redundancy management/failure detection for multisensor integrated navigation systems p 346 A86-26443

Methodology for determination of circuit safety margins for MIL-E-6051 EMC system test p 381 A86-27151

Remote aircraft maintenance monitoring using telemetry p 347 A86-27813

Optimum maintenance of aircraft systems on the basis of their condition with allowance for measurement errors p 354 A86-28310

NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volumes 1 & 2 p 348 A86-28326

A flexible programmable signal processor for next generation fighter aircraft p 385 A86-28330

A novel voice activated switch (VOX) for high noise environments p 348 A86-28335

A distributed, fault-tolerant implementation of the airborne digital map using VLSI common programmable modules p 349 A86-28337

Fiber optic high speed data bus p 385 A86-28338

Imaging connector interconnect system for a parallel fiber optic data bus p 385 A86-28340

A robust 100 MBPS network for avionics applications p 385 A86-28341

High speed fiber optic data bus for avionics integration p 385 A86-28342

High speed bus for Pave Pillar applications p 385 A86-28343

Digital avionics for modern aircraft - A case study into the problems and promise of aircraft electronics p 358 A86-28346

A Modular Stress Management System (MSMS) with worldwide applications p 356 A86-28367

Electronics for advanced electromechanical actuators design considerations --- for flight control p 354 A86-28398

A new approach to ensuring deterministic processing in an integrated avionics software system p 396 A86-28419

Designing into the unknown --- military aircraft software p 398 A86-28420

A FORTRAN algorithm for terrain perspective and plan view display p 398 A86-28421

Software management for integrated avionics systems p 402 A86-28425

A speech recognition research tool for the C-130 Hercules p 350 A86-28443

A case study in simulation vs. stimulation - The B-1 weapon system trainer p 396 A86-28456

Embedded training avionics integration p 360 A86-28463

Unified EM transient protection requirements for aircraft avionics line replaceable units p 355 A86-28485

Expert system applications to the cockpit of the '90s p 399 A86-28487

Application of magneto-optic modulators to advanced avionic displays p 360 A86-28506

The Crew Station Information Manager - An avionics expert system p 361 A86-28515

Avionics standardization: Perceptions and recommendations [AD-A161709] p 361 N86-20388

Fault Tolerant Hardware/Software Architecture for Flight Critical Function [AGARD-LS-143] p 369 N86-20399

Introduction to Lecture Series No. 143: Fault tolerant hardware/software architectures for flight critical functions p 369 N86-20400

Dependable avionic data transmission p 362 N86-20405

Digital fault-tolerant flight actuation systems [AFWAL-83-3041] p 362 N86-20408

Integrated communication, navigation, and identification avionics: Impact analysis. Executive summary [AD-A161799] p 388 N86-20658

## B

**B-1 AIRCRAFT**

A case study in simulation vs. stimulation - The B-1 weapon system trainer p 398 A86-28456

**B-52 AIRCRAFT**

Operation REDWING, Project 5.2, in-flight participation of a B-52 [AD-A995266] p 357 N86-21536

**BALLISTICS**

Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987 [AD-A162792] p 402 N86-22443

**BASIC (PROGRAMMING LANGUAGE)**

BASIC aerodynamics --- Book p 336 A86-26474

**BEAMS (SUPPORTS)**

Beam dampers for skin vibration and noise reduction in the 747 p 390 N86-21917

**BEARINGLESS ROTORS**

Dynamic stability of hingeless and bearingless rotors in forward flight p 366 A86-27662

**BENDING**

Controlled impact demonstration airframe bending bridges p 391 N86-21943

Impact dynamics instrumentation p 392 N86-21948

**BENDING MOMENTS**
Controlled impact demonstration airframe bending bridges p 391 N86-21943
**BIBLIOGRAPHIES**
Publications of the National Bureau of Standards, 1984 catalog
[PB85-245678] p 402 N86-21435
**BIOLOGICAL MODELS (MATHEMATICS)**
Wickens' resource allocation model - Implications for the design of human-machine systems
p 395 A86-28453
**BIPOLAR TRANSISTORS**
Programmable, automated transistor test system
[NASA-TP-2554] p 389 N86-21755
**BIT SYNCHRONIZATION**
Design issues in data synchronous systems
p 382 N86-20407
**BLADE SLAP NOISE**
Recent experiences in the analysis of aircraft cabin noise p 401 N86-21287
**BLADE TIPS**
The prediction of flow around blade tips
p 337 A86-27668
**BODY-WING AND TAIL CONFIGURATIONS**
Tail profile effects on unsteady large scale flow structure in the wing and plate junction p 387 A86-28666
**BODY-WING CONFIGURATIONS**
Analysis of the wing/rotor and rotor/rotor interactions present in tilt-rotor aircraft p 353 A86-27657
An experimental study of the flow and wall pressure field around a wing-body junction p 337 A86-28637
Lift distribution on a high aspect ratio circulation control wing with root lift cutout
[AD-A157024] p 341 N86-20368
Comparison of computational results of a few representative three-dimensional transonic potential flow analysis programs
[NASA-TM-77963] p 341 N86-21509
**BOEING 720 AIRCRAFT**
Electromagnetic pulse test aircraft (EMPTAC) program
p 335 A86-27145
**BOOMS (EQUIPMENT)**
Robotic refueling system for tactical and strategic aircraft
[AD-D011980] p 358 N86-21540
**BOOSTGLIDE VEHICLES**
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443
**BOUNDARY LAYER FLOW**
Material contravariant components - Vorticity transport and vortex theorems p 387 A86-28553
Comment on 'Conical similarity of shock/boundary-layer interactions generated by swept and unswept wings'
p 337 A86-28558
Comparison of computational results of a few representative three-dimensional transonic potential flow analysis programs
[NASA-TM-77963] p 341 N86-21509
**BOUNDARY LAYER SEPARATION**
An experimental study of the flow and wall pressure field around a wing-body junction p 337 A86-28637
Vortex flows in aerodynamics p 338 A86-29417
**BOUNDARY LAYER STABILITY**
Three-dimensional and unsteady boundary-layer computations p 338 A86-29415
The application to airfoils of a technique for reducing orifice-induced pressure error at high Reynolds numbers
[NASA-TP-2537] p 339 N86-20351
**BOUNDARY LAYER TRANSITION**
A new method for laminar boundary layer transition visualization in flight: Color changes in liquid crystal coatings
[NASA-TM-87666] p 342 N86-21518
**BOUNDARY VALUE PROBLEMS**
Three-dimensional boundary layer analysis program Blay and its application
[NASA-TM-77962] p 342 N86-21516
**BOX BEAMS**
Equivalent plate analysis of aircraft wing box structures with general planform geometry
[NASA-TM-87697] p 392 N86-21954
**BRAKING**
Runway rubber removal specification development
[DOT/FAA/PN-85/33] p 372 N86-21556
**BUTT JOINTS**
Properties of diffusion bonded butt joints in Ti-6Al-4V and Ti-4Al-4Mo-2Sn-0.5Si (IMI 550) alloys
p 375 A86-27260

## C

**C-130 AIRCRAFT**
A speech recognition research tool for the C-130 Hercules p 350 A86-28443
Ultrasonic liquid quantity measurement — in oils
p 380 A86-28478
**CALCULATORS**
Helicopter performance computer programs for HP-41 hand-held computer
[AD-A162794] p 358 N86-21539
**CALIBRATING**
Avner Electronic Magnetic Compass and low cost navigation system p 358 A86-28504
Theoretical and experimental investigations of flow vector measurements with angle-of-attack and sideslip sensors on DFVLR meteorological research aircraft
[DFVLR-FB-85-50] p 358 N86-21541
Controlled impact demonstration airframe bending bridges p 391 N86-21943
**CANADA**
Selection of a man-modelling CAD (Computer-Aided Design)
[AD-A161342] p 400 N86-22159
**CANARD CONFIGURATIONS**
Aircraft of special configurations — Russian book
p 335 A86-28521
**CANOPIES**
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443
**CARBON DIOXIDE**
AN-30 photography airplane outfitted for cloud-seeding missions p 393 N86-20898
**CARBON FIBER REINFORCED PLASTICS**
Mechanical design and evaluation of a slotted CFRP waveguide antenna p 383 A86-27703
Diffusion of water in carbon epoxy composites
p 377 A86-27754
**CARBON 13**
Development of LC-13C NMR
[NASA-CR-176656] p 379 N86-21704
**CARBON-CARBON COMPOSITES**
Dual material exhaust nozzle flap
[AD-D011998] p 364 N86-21548
**CARGO AIRCRAFT**
Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS system
[DE85-017614] p 341 N86-20371
**CARTESIAN COORDINATES**
A preliminary note on the development of a three dimensional potential code in Cartesian Coordinates
[NAL-TM-AE-8504] p 399 N86-21233
**CASCADE FLOW**
A loss of dynamic stability of the torsional vibrations of blades due to cascade flutter p 364 A86-27543
**CASTING**
Engineer's Guide to Titanium Castings
p 382 A86-27203
**CASTINGS**
An evaluation of centrifugally cast Ti-4Al-4Mo-2Sn-0.5Si (IMI 550) alloy p 374 A86-27207
**CATALOGS (PUBLICATIONS)**
Publications of the National Bureau of Standards, 1984 catalog
[PB85-245678] p 402 N86-21435
**CAVITATION FLOW**
F100 fuel sampling analysis
[AD-A161667] p 379 N86-21707
**CEMENTS**
Evaluation of the FAA design procedures for high traffic volume pavements
[DOT/FAA/PM-84/14] p 352 N86-20383
**CENTRIFUGAL CASTING**
An evaluation of centrifugally cast Ti-4Al-4Mo-2Sn-0.5Si (IMI 550) alloy p 374 A86-27207
**CERTIFICATION**
Flight Test Instrumentation System FTIS for type-certification of the Indonesian aircraft CN 235
p 356 A86-27818
Noise levels for US certificated and foreign aircraft
[FAA-AC-36-1D] p 401 N86-21279
General aviation pilot and aircraft activity survey
[AD-A161665] p 345 N86-21530
An experimental appraisal of the use of ground-plane microphones for aircraft noise measurement — certification tests
[NPL-AC-104] p 401 N86-22302
**CHANNELS (DATA TRANSMISSION)**
Real-time telemetry of complete 1553 data buses
p 347 A86-27789
Fiber optic high speed data bus p 385 A86-28338
Imaging connector interconnect system for a parallel fiber optic data bus p 385 A86-28340
High speed fiber optic data bus for avionics integration
p 385 A86-28342
High speed bus for Pave Pillar applications
p 385 A86-28343
A dual channel high speed fiber optics multiplex data bus system p 386 A86-28344
Design issues in data synchronous systems
p 382 N86-20407
**CHEMICAL ANALYSIS**
Development of LC-13C NMR
[NASA-CR-176656] p 379 N86-21704
**CHEMICAL ENGINEERING**
Japan report: Science and technology
[JPRS-JST-86-001] p 389 N86-21723
**CHEMICAL REACTIONS**
The 1-(diorganooxyphosphonyl)methyl-2, 4- and -2, 6-dinitro and diamino benzenes and their derivatives
[NASA-CASE-ARC-11425-2] p 378 N86-20499
**CHIRP SIGNALS**
Digital chirp demodulation p 385 A86-28332
**CIRCUIT RELIABILITY**
Methodology for determination of circuit safety margins for MIL-E-6051 EMC system test p 381 A86-27151
Improved reliability of electronic circuits through the use of heat pipes p 386 A86-28479
**CIRCULAR TUBES**
Segmented tubular cushion springs and spring assembly
[NASA-CASE-ARC-11349-1] p 388 N86-20797
**CIRCULATION CONTROL AIRFOILS**
A new and less complex alternative to the Handley Page slat p 356 A86-28563
**CIVIL AVIATION**
Radionavigation planning in the FAA
p 402 A86-26427
Forecasting for civil aviation. I p 393 A86-29002
Oversight on the Federal Aviation Administration fiscal year 1986 research, engineering and development budget request
[GPO-46-725] p 402 N86-21447
State-of-the-art review on composite material fatigue/damage tolerance
[FAA/CT-85/7] p 379 N86-21615
Activities report of the aerospace industry in West Germany
[ISSN-0176-5086] p 403 N86-22450
**CLOUD SEEDING**
AN-30 photography airplane outfitted for cloud-seeding missions p 393 N86-20898
**CLUTTER**
Detection of non-moving targets by airborne mm-wave radars p 351 A86-29783
Weather radar studies
[AD-A161622] p 394 N86-22061
**COANDA EFFECT**
Lift distribution on a high aspect ratio circulation control wing with root lift cutout
[AD-A157024] p 341 N86-20368
**COCKPITS**
A distributed, fault-tolerant implementation of the airborne digital map using VLSI common programmable modules p 349 A86-28337
Selecting cockpit functions for speech I/O technology
p 396 A86-28446
Army 21 - Aviation — strategic and tactical operational concept p 355 A86-28454
2010 - The symbionic cockpit p 355 A86-28455
Expert system applications to the cockpit of the '90s
p 399 A86-28487
Electronic display luminance and grey scale control — for military aircraft p 360 A86-28505
Pilot/Vehicle Interface Design System (PIVIDS)
p 361 A86-28512
Expert System Pilot Aid p 361 A86-28516
Selection of a man-modelling CAD (Computer-Aided Design)
[AD-A161342] p 400 N86-22159
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443
**CODING**
A methodology for applying bar code technology to Aircraft Maintenance Unit support sections
[AD-A161783] p 402 N86-22441
**COLD FRONTS**
Weather radar studies
[AD-A161622] p 394 N86-22061
**COLLISION AVOIDANCE**
Avoiding probe to model collisions in wind tunnel testing p 397 A86-28413
Motion planning in the presence of moving obstacles
[AD-A161374] p 400 N86-22208
**COLOR CODING**
Colour design in aviation cartography
p 358 A86-28066
**COMBAT**
A comparison of digital terrain models and terrain masking algorithms p 350 A86-28391
Design considerations for on-board simulation
p 360 A86-28465

COMBUSTION
Aircraft mishap fire pattern investigations
[AD-A161094] p 344 N86-21528
COMBUSTION CHAMBERS
Fuel property effects on combustion
[AD-A162451] p 378 N86-20522
COMMERCIAL AIRCRAFT
Remote aircraft maintenance monitoring using telemetry p 347 A86-27813
ATRA42 - First of a family p 353 A86-28060
Noise levels for US certificated and foreign aircraft
[FAA-AC-36-1D] p 401 N86-21279
COMMUNICATION NETWORKS
A robust 100 MBPS network for avionics applications
p 365 A86-28341
Modular simulators - Is a local area network sufficient? — for use in flight simulators p 371 A86-28460
A satellite system for aeronautical data communications
[AIAA PAPER 86-0602] p 351 A86-29578
COMMUNICATION SATELLITES
A satellite system for aeronautical data communications
[AIAA PAPER 86-0602] p 351 A86-29578
COMPARISON
Comparison of airborne data acquisition systems at ARL (Aeronautical Research Laboratories)
[AD-A161664] p 357 N86-21537
Relative accuracy of ALPEX aircraft data: An evaluation of the ALPEX intercomparison flight with the NCAR (National Center for Atmospheric Research) Electra, the NOAA (National Oceanic and Atmospheric Administration P3 and the DFVLR (Deutsche Forschungs- und Versuchsanstalt fuer Luft-und Raumfahrt) Falcon
[PB86-100823] p 394 N86-22067
COMPATIBILITY
Selection of a man-modelling CAD (Computer-Aided Design)
[AD-A161342] p 400 N86-22159
COMPENSATORS
A contribution to the digital compensation of periodic disturbances with frequencies in bounded intervals — in helicopters
[DFVLR-FB-85-55] p 370 N86-21553
COMPONENT RELIABILITY
Optimum maintenance of aircraft systems on the basis of their condition with allowance for measurement errors
p 354 A86-28310
Problems in the dynamics of aircraft structures exposed to intensive acoustic loading p 384 A86-28316
COMPOSITE MATERIALS
The damping capacity of layered materials
p 374 A86-27084
Analytical and experimental studies of textile structural composites p 377 A86-27652
State-of-the-art review on composite material fatigue/damage tolerance
[FAA/CT-85/7] p 379 N86-21615
Aminophenoxycyclotriphosphazene cured epoxy resins and the composites, laminates and structures thereof
[NASA-CASE-ARC-11548-1] p 379 N86-21686
NASA experiments on the B-720 structure and seats
p 390 N86-21936
COMPOSITE STRUCTURES
A study of the static post buckling behavior of composite sandwich plates p 383 A86-27653
Optimal design of composite power transmission shafting p 353 A86-27654
Measurements of the response of transport aircraft ceiling panels to fuel fires p 343 A86-28564
Advances in aerospace structural analysis; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 387 A86-28651
Aminophenoxycyclotriphosphazene cured epoxy resins and the composites, laminates and structures thereof
[NASA-CASE-ARC-11548-1] p 379 N86-21686
COMPRESSIBLE FLOW
A perturbative lambda formulation — for compressible flow p 337 A86-28535
COMPRESSOR BLADES
Embrittled trailing edges of compressor blades (titanium alloy Ti6Al-4V and Ti6Al2Sn4Zr2Mo) of gas turbine aero-engines p 376 A86-27279
A loss of dynamic stability of the torsional vibrations of blades due to cascade flutter p 364 A86-27543
COMPRESSOR EFFICIENCY
High frequency-heated air turbojet
[NASA-TM-77710] p 364 N86-21543
COMPUTATION
Computation of three dimensional potential flow around a finite wing with a leading-edge discontinuity at high angle of attack p 341 N86-21504
COMPUTATIONAL FLUID DYNAMICS
Nonlinear analysis of pressure oscillations in ramjet engines
[AIAA PAPER 86-0001] p 363 A86-29601
A perturbative lambda formulation — for compressible flow p 337 A86-28535
Three-dimensional and unsteady boundary-layer computations p 338 A86-29415
Vortex flows in aerodynamics p 338 A86-29417
Numerical methods in fluid dynamics
p 388 A86-29471
Transonic flow calculations for aircraft
p 338 A86-29474
Numerical analysis of nonequilibrium flow about airfoil in thin shock layer approximation p 343 N86-22258
COMPUTATIONAL GRIDS
A perturbative lambda formulation — for compressible flow p 337 A86-28535
COMPUTER AIDED DESIGN
Aeroelastic tailoring study in aircraft design
p 383 A86-27741
A modeling structure for computer aided design
p 397 A86-28403
CAD/CAM supports flight test modifications
p 356 A86-29823
Parametric Bi-cubic surface patch for computer aided geometric design of aircraft and/or other three-dimensional geometries
[NAL-TM-AE-8505] p 399 N86-21168
Three-dimensional boundary layer analysis program Blay and its application
[NASA-TM-77962] p 342 N86-21516
Helicopter performance computer programs for HP-41 hand-held computer
[AD-A162794] p 358 N86-21539
COMPUTER AIDED MANUFACTURING
CAD/CAM supports flight test modifications
p 356 A86-29823
COMPUTER GRAPHICS
An overview of the intrasystem EMC analysis program with graphics p 381 A86-27157
Implementation of TF/TA in the digital terrain management and display system p 359 A86-28390
Real-time circle generation for raster displays --- computer graphics for aircraft displays
p 361 A86-28511
Data reduction, management, and analysis software for CID p 399 N86-21938
COMPUTER NETWORKS
Dependable avionic data transmission
p 362 N86-20405
COMPUTER PROGRAM INTEGRITY
Application of fuzzy logic to the estimation of software reliability for computer systems p 396 A86-27472
COMPUTER PROGRAMS
BASIC aerodynamics — Book p 336 A86-26474
Methodology for determination of circuit safety margins for MIL-E-6051 EMC system test p 381 A86-27151
An overview of the intrasystem EMC analysis program with graphics p 381 A86-27157
The development of microcomputer codes for studying the flight dynamics and performance of helicopters
p 366 A86-27660
Avoiding probe to model collisions in wind tunnel testing p 397 A86-28413
A FORTRAN algorithm for terrain perspective and plan view display p 398 A86-28421
Instructor station for the ILLIMAC general aviation instrument training simulator p 371 A86-28462
Aeroelasticity at the NASA Langley Research Center Recent progress, new challenges
[NASA-TM-87660] p 336 N86-20342
Method for the prediction of the installation aerodynamics of a propfan at subsonic speeds: User manual
[NASA-CR-178057] p 340 N86-20360
A numerical and experimental investigation of electrochemical aircraft deicing
[NASA-CR-175024] p 344 N86-20380
Controlled impact demonstration airframe bending bridges p 391 N86-21943
Selection of a man-modelling CAD (Computer-Aided Design)
[AD-A161342] p 400 N86-22159
COMPUTER SYSTEMS DESIGN
A new approach to ensuring deterministic processing in an integrated avionics software system
p 398 A86-28419
Design considerations for on-board simulation
p 360 A86-28465
COMPUTER SYSTEMS PERFORMANCE
Application of fuzzy logic to the estimation of software reliability for computer systems p 396 A86-27472
COMPUTER SYSTEMS PROGRAMS
Fault Tolerant Hardware/Software Architecture for Flight Critical Function
[AGARD-LS-143] p 369 N86-20399
Introduction to Lecture Series No. 143: Fault tolerant hardware/software architectures for flight critical functions p 369 N86-20400
Digital fly-by-wire experience p 361 N86-20401
COMPUTER TECHNIQUES
Numerical optimization design of advanced transonic wing configurations p 356 A86-28562
COMPUTERIZED SIMULATION
Digital chirp demodulation p 385 A86-28332
Data-driven operating concepts for real-time simulation systems p 397 A86-28348
A case study in simulation vs. stimulation - The B-1 weapon system trainer p 398 A86-28456
An expert planner for the dynamic flight environment
p 368 A86-28490
Numerical simulation of a controlled-flow tunnel for V/STOL testing p 371 A86-28561
Airport-Noise Levels and Annoyance Model (ALAMO) user's guide
[NASA-TM-87695] p 401 N86-22304
CONCENTRIC CYLINDERS
Contact heat transfer - The last decade
p 387 A86-28551
CONCRETES
Evaluation of the FAA design procedures for high traffic volume pavements
[DOT/FAA/PM-84/14] p 352 N86-20383
CONFERENCES
Conference on Steels and Special Alloys in Aeronautics, 11th, Le Bourget, France, June 6, 1985, Proceedings
p 372 A86-26326
Institute of Navigation, Annual Meeting, 41st, U.S. Naval Academy, Annapolis, MD, June 25-27, 1985, Proceedings p 346 A86-26501
Combined experimental/analytical modeling of dynamic structural systems; Proceedings of the Joint Mechanics Conference, Albuquerque, NM, June 24-26, 1985

Advances in aerospace structural analysis; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 387 A86-28651
Numerical methods in fluid dynamics
p 388 A86-29471
Modal analysis of a typical fighter aircraft using transient testing technique
[NAL-TM-ST-8517] p 356 N86-20385
Proceedings of the 1985 ONR/NAVAIR Wave Rotor Research and Technology Workshop
[AD-A161539] p 389 N86-20813
Proceedings of Cabin Safety Conference and Workshop held on 11-14 December 1984
[AD-A160950] p 344 N86-21527
Full-Scale Transport controlled Impact Demonstration
[NASA-CP-2395] p 390 N86-21933
CONGRESSIONAL REPORTS
Oversight on the Federal Aviation Administration fiscal year 1986 research, engineering and development budget request
[GPO-46-725] p 402 N86-21447
CONICAL BODIES
Applying I. G. Bubnov's method to the solution of the natural vibration problem for a conical sandwich panel
p 384 A86-28315

**CONICAL FLOW**
Comment on 'Conical similarity of shock/boundary-layer interactions generated by swept and unswept wings' p 337 A86-28558

**CONSTRAINTS**
Limiting performance of nonlinear systems with applications to helicopter vibration control [AD-A161457] p 370 N86-21551

**CONSTRICTIONS**
Galley and overhead compartment experiment results: Full-scale transport controlled impact demonstration [DOT/FAA/CT-85/33] p 343 N86-20378

**CONTROL CONFIGURED VEHICLES**
YF16CCV flight control system reconfiguration design using quantitative feedback theory p 368 A86-28395

**CONTROL SIMULATION**
In-flight simulators p 356 A86-29299

**CONTROL SURFACES**
Multivariable control law design for the AFTI/F-16 with a failed control surface p 367 A86-28380
Detection and isolation of control surface effectiveness failures in high performance aircraft p 367 A86-28392
Lift distribution on a high aspect ratio circulation control wing with root lift cutout [AD-A157024] p 341 N86-20368
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987 [AD-A162792] p 402 N86-22443

**CONTROL SYSTEMS DESIGN**
Quantitative feedback design approach to pilot-in-the-loop analysis p 366 A86-28377
Discrete maneuver flying qualities considerations in control system design p 366 A86-28378
Development of hardware for X-29A flight control system p 366 A86-28379
Multivariable control law design for the AFTI/F-16 with a failed control surface p 367 A86-28380
An integrated flight control system for a STOL transport aircraft p 367 A86-28384
Variable control policies for future aerospace vehicles p 367 A86-28386
Design of direct digital flight-mode control systems for high-performance aircraft using step-response matrices p 367 A86-28387
Evaluation of control mixer concept for reconfiguration of flight control system p 367 A86-28393
An automatic redesign approach for restructurable control systems p 368 A86-28394
YF16CCV flight control system reconfiguration design using quantitative feedback theory p 368 A86-28395
Lockheed-Georgia and electric primary flight control systems p 368 A86-28396
Digital fault tolerant flight actuation systems p 354 A86-28400
Microprocessor controlled and managed fly-by-wire hydraulic actuator p 368 A86-28401
A survivable fly-by-wire spoiler actuation system featuring nonflammable fluid, 8,000 PSI hydraulics and direct drive valves p 355 A86-28402
A modeling structure for computer aided design p 397 A86-28403
An expert system for integrated aircraft/engine controls design p 355 A86-28405
IV&V for the automatic test control system in the USAF Aeropropulsion Systems Test Facility p 398 A86-28430
Advancing flight control technology p 369 A86-29058
Computation of transfer function matrices [NAL-TM-SE-8509] p 399 N86-21232

**CONTROL THEORY**
YF16CCV flight control system reconfiguration design using quantitative feedback theory p 368 A86-28395

**CONTROLLERS**
Effects of side-stick controllers on rotorcraft handling qualities for terrain flight p 366 A86-27659

**COOLING SYSTEMS**
Improved reliability of electronic circuits through the use of heat pipes p 386 A86-28479

**COPOLYMERIZATION**
Copolymers of vinyl styrylpyridines or vinyl stilbazoles with bismaleimide [NASA-CASE-ARC-11429-1-CU] p 378 N86-20560

**CORROSION**
Structural evaluation of superplastic aluminum. Part 1. Mechanical, corrosion, metallurgical data [AD-A161366] p 379 N86-21662

**CORROSION RESISTANCE**
Conductive heterocyclic ladder polymers [AD-D011915] p 378 N86-20569

**COST ANALYSIS**
EB repair welding of a critical aircraftpart made from the nonweldable titanium alloy 3.7184.7 (Ti-Al4-Mo4-Sn2-Si) p 382 A86-27278
Producibility and cost studies of aviation kerosene [AGARD-AR-227] p 379 N86-20580

**COST EFFECTIVENESS**
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987 [AD-A162792] p 402 N86-22443

**COST ESTIMATES**
Jet engine operating and support cost estimating relationship development [AD-A161663] p 364 N86-21547

**COST REDUCTION**
An engineering approach to the inverse transonic wing design problem p 336 A86-26409

**COVARIANCE**
Covariance specification for the linear time-invariant output-feedback control systems using a Kalman filter [NAL-TR-882] p 368 N86-20677
Covariance specification for the linear time-invariant output-feedback control systems using a Kalman filter [NAL-TR-882] p 399 N86-21219

**CRACK PROPAGATION**
Fatigue-crack propagation through titanium welds p 375 A86-27264
Studies on crack growth rate of high temperature titanium alloys p 376 A86-27384
High temperature fatigue behavior of IMI 685 p 376 A86-27385
References and conference proceedings towards the understanding of fracture mechanics p 388 A86-29011

**CRASH LANDING**
Aircraft accident report: Galaxy Airlines, Inc., Lockheed Electra-L-188C, N5532, Reno, Nevada, January 21, 1985 [PB86-910401] p 344 N86-21526

**CRASHES**
Galley and overhead compartment experiment results: Full-scale transport controlled impact demonstration [DOT/FAA/CT-85/33] p 343 N86-20378
Full-Scale Transport controlled Impact Demonstration [NASA-CP-2395] p 390 N86-21933
CID overview p 390 N86-21934
CID flight/impact p 390 N86-21935
NASA experiments on the B-720 structure and seats p 390 N86-21936
Controlled impact demonstration seat/cabin restraint systems: FAA p 390 N86-21937
Data reduction, management, and analysis software for CID p 399 N86-21938
NASA seat experiment and occupant responses p 390 N86-21939
Structural loads preliminary results p 391 N86-21940
Digital filtering and acceleration pulse interpretation p 400 N86-21941
Preliminary floor, seat, and dummy data p 391 N86-21942
Controlled impact demonstration flight data recorders/cockpit voice recorders p 391 N86-21944
United States Navy - Canadian forces solid state flight data recorder/crash position locator experiment on the B-720 controlled impact demonstration p 391 N86-21945
Controlled impact demonstration on-board (interior) photographic system p 392 N86-21946
CID-720 aircraft high-environment flight instrumentation system p 392 N86-21947
Impact dynamics instrumentation p 392 N86-21948
CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949

**CRASHWORTHINESS**
Structural impact and crashworthiness; Proceedings of the International Conference, Imperial College of Science and Technology, London, England, July 16-20, 1984. Volume 1 Keynote Lectures. Volume 2 - Conference Papers p 383 A86-28276
Full-Scale Transport controlled Impact Demonstration [NASA-CP-2395] p 390 N86-21933
CID overview p 390 N86-21934
NASA experiments on the B-720 structure and seats p 390 N86-21936
Controlled impact demonstration seat/cabin restraint systems: FAA p 390 N86-21937
Data reduction, management, and analysis software for CID p 399 N86-21938
Structural loads preliminary results p 391 N86-21940
Controlled impact demonstration airframe bending bridges p 391 N86-21943
Controlled impact demonstration flight data recorders/cockpit voice recorders p 391 N86-21944
CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949

**CREW PROCEDURES (INFLIGHT)**
Aircraft accident report: Galaxy Airlines, Inc., Lockheed Electra-L-188C, N5532, Reno, Nevada, January 21, 1985 [PB86-910401] p 344 N86-21526

**CREW STATIONS**
The Crew Station Information Manager - An avionics expert system p 361 A86-28515
Selection of a man-modeling CAD (Computer-Aided Design) [AD-A161342] p 400 N86-22159

**CRITICAL LOADING**
Efficient identification of critical stresses in structures subject to dynamic loads p 380 A86-26682

**CRYOGENIC WIND TUNNELS**
Cryogenic tunnel measurement of total temperature and pressure p 387 A86-28570

**CURING**
Aminophenoxycyclotriphosphazene cured epoxy resins and the composites, laminates and structures thereof [NASA-CASE-ARC-11548-1] p 379 N86-21686

**CURVED PANELS**
Applying I. G. Bubnov's method to the solution of the natural vibration problem for a conical sandwich panel p 384 A86-28315

**CYLINDRICAL SHELLS**
Segmented tubular cushion springs and spring assembly [NASA-CASE-ARC-11349-1] p 366 N86-20797

## D

**DAMAGE**
State-of-the-art review on composite material fatigue/damage tolerance [FAA/CT-85/7] p 379 N86-21615
United States Navy - Canadian forces solid state flight data recorder/crash position locator experiment on the B-720 controlled impact demonstration p 391 N86-21945

**DATA ACQUISITION**
Comparison of airborne data acquisition systems at ARL (Aeronautical Research Laboratories) [AD-A161664] p 357 N86-21537
Full-Scale Transport controlled Impact Demonstration [NASA-CP-2395] p 390 N86-21933
CID-720 aircraft high-environment flight instrumentation system p 392 N86-21947
Impact dynamics instrumentation p 392 N86-21948
CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949

**DATA BASES**
Real time optimal flight path generation by storage of massive data bases p 397 A86-28388

**DATA CORRELATION**
Controlled impact demonstration flight data recorders/cockpit voice recorders p 391 N86-21944

**DATA LINKS**
A satellite system for aeronautical data communications [AIAA PAPER 86-0602] p 351 A86-29578

**DATA MANAGEMENT**
Data reduction, management, and analysis software for CID p 399 N86-21938

**DATA PROCESSING**
TSPI data processing in the telemetry environment --- Time Space Position Information for flight tests p 347 A86-27804
Research on the aerodynamic characteristics of vehicles by free flight testing at supersonic speeds [NAL-TR-876] p 339 N86-20353
Digital filtering and acceleration pulse interpretation p 400 N86-21941
Airport-Noise Levels and Annoyance Model (ALAMO) system's reference manual [NASA-TM-87694] p 401 N86-22305

**DATA PROCESSING TERMINALS**
Instructor station for the ILLIMAC general aviation instrument training simulator p 371 A86-28462

**DATA REDUCTION**
Data reduction, management, and analysis software for CID p 399 N86-21938

**DATA SAMPLING**
Controlled impact demonstration flight data recorders/cockpit voice recorders p 391 N86-21944

**DATA SYSTEMS**
A robust 100 MBPS network for avionics applications p 385 A86-28341
A dual channel high speed fiber optics multiplex data bus system p 386 A86-28344
Data systems for logistics evaluation during operational test p 398 A86-28483

**DC 9 AIRCRAFT**
Aircraft accident report: Air Canada Flight 797, McDonnell Douglas DC-9-32, C-FTLU Greater Cincinnati International Airport, Covington, Kentucky, June 2, 1983 [PB86-910402] p 344 N86-21525

**DEATH**
Aircraft accident report: Air Canada Flight 797, McDonnell Douglas DC-9-32, C-FTLU Greater Cincinnati International Airport, Covington, Kentucky, June 2, 1983 [PB86-910402] p 344 N86-21525

**DECISION MAKING**
A methodology for applying bar code technology to Aircraft Maintenance Unit support sections [AD-A161783] p 402 N86-22441

**DEFENSE PROGRAM**
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987 [AD-A162792] p 402 N86-22443

**DEGREES OF FREEDOM**
Research on the aerodynamic characteristics of vehicles by free flight testing at supersonic speeds [NAL-TR-876] p 339 N86-20353

**DEICERS**
Piezoelectric deicing device [NASA-CASE-LEW-13773-2] p 388 N86-20671

**DEICING**
Electro-impulse de-icing of aircraft engine inlets [AIAA PAPER 86-0546] p 352 A86-26647
A numerical and experimental investigation of electrochemical aircraft deicing [NASA-CR-175024] p 344 N86-20380

**DELTA WINGS**
An attached flow design of a noninterfering leading-edge extension to a thick delta wing p 337 A86-28569
A visualisation study of the vortex flow around double-delta wings [ARL-AERO-R-165] p 340 N86-20362

**DEMAND (ECONOMICS)**
Producibility and cost studies of aviation kerosene [AGARD-AR-227] p 379 N86-20580

**DEMODULATION**
Digital chirp demodulation p 385 A86-28332

**DESIGN ANALYSIS**
YF16CCV flight control system reconfiguration design using quantitative feedback theory p 368 A86-28395
Designing into the unknown --- military aircraft software p 398 A86-28420

**DIES**
The thermo-mechanical processing during closed die forging - A method of improving aeronautical materials p 380 A86-26336

**DIESEL ENGINES**
Proceedings of the 1985 ONR/NAVAIR Wave Rotor Research and Technology Workshop [AD-A161539] p 389 N86-20813

**DIFFUSION**
Diffusion of water in carbon epoxy composites p 377 A86-27754

**DIFFUSION WELDING**
Properties of diffusion bonded butt joints in Ti-6Al-4V and Ti-4Al-4Mo-2Sn-0.5Si (IMI 550) alloys p 375 A86-27260
Advanced structural components by SPF/DB processing --- superplastic forming and diffusion bonding p 363 A86-27271
Producibility of aircraft structural parts by superplastic forming and diffusion bonding p 382 A86-27272
Fundamental investigation on the impact strength of hollow fan blades [NAL-TR-879] p 389 N86-20864

**DIGITAL DATA**
Data reduction, management, and analysis software for CID p 399 N86-21938

**DIGITAL FILTERS**
A combined optimal algorithm for filtering and calculating navigation coordinates p 348 A86-28311
Numerical synthesis of tri-variate velocity realizations of turbulence p 387 A86-28654
Digital filtering and acceleration pulse interpretation p 400 N86-21941

**DIGITAL NAVIGATION**
A combined optimal algorithm for filtering and calculating navigation coordinates p 348 A86-28311
Design techniques for improved map-aided navigation p 349 A86-28357

**DIGITAL SIMULATION**
A comparison of digital terrain models and terrain masking algorithms p 350 A86-28391

**DIGITAL SYSTEMS**
Remote aircraft maintenance monitoring using telemetry p 347 A86-27813
Digital avionics for modern aircraft - A case study into the problems and promise of aircraft electronics p 358 A86-28346
Design of direct digital flight-mode control systems for high-performance aircraft using step-response matrices p 367 A86-28387
Implementation of TF/TA in the digital terrain management and display system p 359 A86-28390
Digital fault tolerant flight actuation systems p 354 A86-28400
Digital fault-tolerant flight actuation systems [AFWAL-83-3041] p 362 N86-20408

**DIGITAL TECHNIQUES**
Digital chirp demodulation p 385 A86-28332
Flying qualities design criteria for highly augmented systems p 369 A86-28509
Digital filtering and acceleration pulse interpretation p 400 N86-21941

**DISKS (SHAPES)**
Structural evaluation of superplastic aluminum. Part 1. Mechanical, corrosion, metallurgical data [AD-A161366] p 379 N86-21662

**DISPLAY DEVICES**
Colour design in aviation cartography p 358 A86-28066
Implementation of TF/TA in the digital terrain management and display system p 359 A86-28390
A FORTRAN algorithm for terrain perspective and plan view display p 398 A86-28421
Electronic display luminance and grey scale control --- for military aircraft p 360 A86-28505
Application of magneto-optic modulators to advanced avionic displays p 360 A86-28506
Real-time circle generation for raster displays --- computer graphics for aircraft displays p 361 A86-28511
Pilot/Vehicle Interface Design System (PIVIDS) p 361 A86-28512

**DISTANCE MEASURING EQUIPMENT**
Minimum operational performance standards for airborne Distance Measuring Equipment (DME) operation within the radio frequency range of 960-1215 megahertz [RTCA/DO-189] p 382 N86-21542

**DISTRIBUTED PROCESSING**
Imaging connector interconnect system for a parallel fiber optic data bus p 385 A86-28340
The development status of JTIDS dual mode TDMA and distributed TDMA (DTDMA) full scale development terminals - An update p 351 A86-28473

**DISTRIBUTION MOMENTS**
Analysis of aerodynamic coefficients using gradient data: Spanwise turbulence effects on airplane response [NASA-CR-3961] p 393 N86-21069

**DO-28 AIRCRAFT**
The icing research aircraft DO28, D-IFMP of DFVLR, and its measuring equipment [DFVLR-MITT-85-12] p 394 N86-22064

**DOMES (STRUCTURAL FORMS)**
Airborne tracking Sun photometer apparatus and system [NASA-CASE-ARC-11622-1] p 394 N86-21982

**DOPPLER RADAR**
The Stapleton microburst advisory service project: An operational viewpoint [AD-A161543] p 394 N86-21078
Weather radar studies [AD-A161622] p 394 N86-22061

**DRILLING**
Vertically operating flight vehicle for drilling and agricultural use [NASA-TM-77713] p 357 N86-21535

**DROP TESTS**
Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS system [DE85-017614] p 341 N86-20371
CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949

**DUCT GEOMETRY**
Installation effects of long-duct pylon-mounted nacelles on a twin-jet transport model with swept supercritical wing [NASA-TP-2457] p 339 N86-20346

**DUMMIES**
Preliminary floor, seat, and dummy data p 391 N86-21942
Impact dynamics instrumentation p 392 N86-21948

**DYNAMIC CHARACTERISTICS**
Motion planning in the presence of moving obstacles [AD-A161374] p 400 N86-22208

**DYNAMIC CONTROL**
Numerical simulation of a controlled-flow tunnel for V/STOL testing p 371 A86-28561

**DYNAMIC LOADS**
Problems in the dynamics of aircraft structures exposed to intensive acoustic loading p 384 A86-28316
A design guide for damping of aerospace structures p 390 N86-21923

**DYNAMIC MODELS**
Modal test requirements for coupled structure analysis using experimentally-derived component models p 380 A86-26878
Expert systems for real time applications p 398 A86-28486

**DYNAMIC PROGRAMMING**
Real time optimal flight path generation by storage of massive data bases p 397 A86-28388
Demonstration of an innovative technique for Terrain Following/Terrain Avoidance - The Dynapath Algorithm p 350 A86-28389

**DYNAMIC RESPONSE**
Modal analysis of a typical fighter aircraft using transient testing technique [NAL-TM-ST-8517] p 356 N86-20385
Optimal airframe synthesis for gust loads [NASA-CR-178047] p 357 N86-20386
A programme of research into the aerodynamics, stability and control characteristics of a combat aircraft having a forward swept wing p 357 N86-21533
Operation REDWING, Project 5.2, in-flight participation of a B-52 [AD-A995286] p 357 N86-21536
Use of skin damping treatments to control airframe dynamic response for interior noise control p 389 N86-21919

**DYNAMIC STABILITY**
A loss of dynamic stability of the torsional vibrations of blades due to cascade flutter p 364 A86-27543
Dynamic stability of hingeless and bearingless rotors in forward flight p 366 A86-27662
Dynamic stability of elastic structures under random influences p 384 A86-28318
A design guide for damping of aerospace structures p 390 N86-21923

**DYNAMIC STRUCTURAL ANALYSIS**
Efficient identification of critical stresses in structures subject to dynamic loads p 380 A86-26682
Combined experimental/analytical modeling of dynamic structural systems; Proceedings of the Joint Mechanics Conference, Albuquerque, NM, June 24-26, 1985 p 380 A86-26876
Modal test requirements for coupled structure analysis using experimentally-derived component models p 380 A86-26878
Experimental system identification for experimental/analytical correlation and modelling p 381 A86-26883
The effect of limiting aerodynamic and structural coupling in models of mistuned bladed disk vibration p 383 A86-26905
Structural dynamic aspects of rotor antiresonant isolation p 353 A86-27663
Problems in the stability and dynamics of aircraft structures with physicomechanical singularities p 384 A86-28321
Linear and nonlinear modal analysis of aeroelastic structural systems p 387 A86-28742
Equivalent plate analysis of aircraft wing box structures with general planform geometry [NASA-TM-87697] p 392 N86-21954

**DYNAMIC TESTS**
A programme of research into the aerodynamics, stability and control characteristics of a combat aircraft having a forward swept wing p 357 N86-21533
Operation REDWING, Project 5.2, in-flight participation of a B-52 [AD-A995286] p 357 N86-21536

**DYNAMICAL SYSTEMS**
Energy dissipation connected with vibrations of mechanical systems p 381 A86-27076

## E

**EARPHONES**
Improving intelligibility in audio distribution systems p 395 A86-28513

**ECONOMIC ANALYSIS**
Production-theoretical study of air traffic output production --- German thesis p 402 A86-27834

**EFFICIENCY**
Minimum operational performance standards for airborne Distance Measuring Equipment (DME) operation within the radio frequency range of 960-1215 megahertz [RTCA/DO-189] p 382 N86-21542

**ELASTIC BODIES**
Dynamic stability of elastic structures under random influences p 384 A86-28318

**ELASTIC BUCKLING**
A study of the static post buckling behavior of composite sandwich plates p 383 A86-27653

**ELASTIC PROPERTIES**
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987 [AD-A162792] p 402 N86-22443

**ELASTODYNAMICS**
Experimental system identification for experimental/analytical correlation and modelling p 381 A86-26883

**ELECTRA AIRCRAFT**
Aircraft accident report: Galaxy Airlines, Inc., Lockheed Electra-L-188C, N5532, Reno, Nevada, January 21, 1985 [PB86-910401] p 344 N86-21526

**ELECTRIC BATTERIES**
Controlled impact demonstration on-board (interior) photographic system p 392 N86-21946

**ELECTRIC CONTROL**
Lockheed-Georgia and electric primary flight control systems p 368 A86-28396
A contribution to the digital compensation of periodic disturbances with frequencies in bounded intervals --- in helicopters [DFVLR-FB-85-55] p 370 N86-21553

**ELECTRIC GENERATORS**
Multivoltage high power electrical power system p 386 A86-28376

**ELECTRIC MOTORS**
Control of a high-speed, brushless dc motor driven through a cycloconverter line --- for aircraft fuel pumps p 386 A86-28372

**ELECTRIC POWER SUPPLIES**
Aircraft electrical power systems p 364 A86-28508

**ELECTRIC PULSES**
Electro-impulse de-icing of aircraft engine inlets [AIAA PAPER 86-0546] p 352 A86-26647

**ELECTRICAL PROPERTIES**
Conductive heterocyclic ladder polymers [AD-D011915] p 378 N86-20569

**ELECTRICAL RESISTIVITY**
Study on the digital position transducer with optical time-delay pulse [NAL-TR-878] p 368 N86-20759

**ELECTROMAGNETIC COMPATIBILITY**
International Symposium on Electromagnetic Compatibility, Wakefield, MA, August 20-22, 1985, Record p 381 A86-27126
Aircraft coupling model evaluations at SHF/EHF p 346 A86-27128
Methodology for determination of circuit safety margins for MIL-E-6051 EMC system test p 381 A86-27151
An overview of the intrasystem EMC analysis program with graphics p 381 A86-27157

**ELECTROMAGNETIC MEASUREMENT**
Characterization of shallow ocean sediments using the airborne electromagnetic method p 393 A86-28065

**ELECTROMAGNETIC PULSES**
Electromagnetic pulse test aircraft (EMPTAC) program p 335 A86-27145
The parallel-plate and rhombic EMP simulators - A summarizing review p 381 A86-27146

**ELECTROMAGNETIC SHIELDING**
Electromagnetic pulse test aircraft (EMPTAC) program p 335 A86-27145
Unified EM transient protection requirements for aircraft avionics line replaceable units p 355 A86-28485

**ELECTROMAGNETS**
Aircraft electrical power systems p 364 A86-28508

**ELECTROMECHANICAL DEVICES**
Electromechanical actuation reliability and survivability --- for flight control surface motion in military aircraft p 354 A86-28397
Electronics for advanced electromechanical actuators design considerations --- for flight control p 354 A86-28398

**ELECTRON BEAM WELDING**
Reliable nondestructive testing - The key to using weldments in critical fighter aircraft structure p 380 A86-26544
EB repair welding of a critical aircraftpart made from the nonweldable titanium alloy 3.7184.7 (Ti-Al4-Mo4-Sn2-Si) p 382 A86-27278

**ELECTRONIC AIRCRAFT**
Flying qualities design criteria for highly augmented systems p 389 A86-28509

**ELECTRONIC EQUIPMENT**
Avner Electronic Magnetic Compass and low cost navigation system p 356 A86-28504
Improved reliability of electronic circuits through the use of heat pipes p 386 A86-28479
Unified EM transient protection requirements for aircraft avionics line replaceable units p 355 A86-28485

**ELECTRONIC EQUIPMENT TESTS**
Methodology for determination of circuit safety margins for MIL-E-6051 EMC system test p 381 A86-27151

**EMBEDDED COMPUTER SYSTEMS**
Embedded training avionics integration p 390 A86-28463
Design considerations for on-board simulation p 380 A86-28465

**ENERGY ABSORPTION**
NASA experiments on the B-720 structure and seats p 390 N86-21936
NASA seat experiment and occupant responses p 390 N86-21939

**ENERGY CONSERVATION**
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987 [AD-A162792] p 402 N86-22443

**ENERGY DISSIPATION**
Energy dissipation connected with vibrations of mechanical systems p 381 A86-27076

**ENERGY LEVELS**
Operation REDWING, Project 5.2, in-flight participation of a B-52 [AD-A995286] p 357 N86-21536

**ENERGY POLICY**
Japan report: Science and technology [JPRS-JST-86-001] p 389 N86-21723

**ENERGY TECHNOLOGY**
Japan report: Science and technology [JPRS-JST-86-001] p 389 N86-21723

**ENERGY TRANSFER**
Proceedings of the 1985 ONR/NAVAIR Wave Rotor Research and Technology Workshop [AD-A161539] p 389 N86-20813

**ENGINE CONTROL**
Control of a high-speed, brushless dc motor driven through a cycloconverter line --- for aircraft fuel pumps p 386 A86-28372
An expert system for integrated aircraft/engine controls design p 355 A86-28405

**ENGINE DESIGN**
Will 1990s aircraft be powered by propfan or advanced turbofan? p 363 A86-28370
Propfan engine designs examined p 363 A86-28371
Jet engine operating and support cost estimating relationship development [AD-A161683] p 364 N86-21547

**ENGINE FAILURE**
Airplane automatic control force trimming device for asymmetric engine failures [NASA-CASE-LAR-13280-1] p 369 N86-20397

**ENGINE INLETS**
Electro-impulse de-icing of aircraft engine inlets [AIAA PAPER 86-0546] p 352 A86-26647
Effect of underwing aft-mounted nacelles on the longitudinal aerodynamic characteristics of a high-wing transport airplane [NASA-TP-2447] p 339 N86-20345
Particle trajectory computation on a 3-dimensional engine inlet [NASA-CR-175023] p 344 N86-20379

**ENGINE PARTS**
Materials in thrust reversers p 373 A86-26332
Effect of processing and heat treatment on the mechanical properties of Ti-6Al-2Sn-4Zr-6Mo alloy p 375 A86-27231
Isothermal forging system for the production of large rotating components from titanium alloys or superalloys p 382 A86-27247
Advanced structural components by SPF/DB processing --- superplastic forming and diffusion bonding p 363 A86-27271
Fatigue behaviour of titanium materials in aircraft engines p 375 A86-27275
The strain controlled fatigue behaviour of a near-alpha titanium alloy p 376 A86-27383
Fuel property effects on combustion [AD-A162451] p 378 N86-20522

**ENGINE STARTERS**
Power thyristor starter for aircraft engine p 386 A86-28373

**ENGINE TESTING LABORATORIES**
IV&V for the automatic test control system in the USAF Aeropropulsion Systems Test Facility p 398 A86-28430

**ENGINE TESTS**
A unified method for evaluating the strength and reliability of the blades of the axial-flow compressors and gas turbines of aircraft engines p 364 A86-28317

**ENGINEERING MANAGEMENT**
Oversight on the Federal Aviation Administration fiscal year 1986 research, engineering and development budget request [GPO-46-725] p 402 N86-21447

**ENGINES**
Safety study: Ultraviolet vehicle accidents [PB85-917001] p 343 N86-20377

**ENVIRONMENT SIMULATION**
Lightning simulation tests on a graphite/epoxy airplane mockup p 355 A86-28514

**ENVIRONMENTAL CONTROL**
Aircraft electrical power systems p 364 A86-28508

**EPOXY RESINS**
Diffusion of water in carbon epoxy composites p 377 A86-27754
Aminophenoxycyclotriphosphazene cured epoxy resins and the composites, laminates and structures thereof [NASA-CASE-ARC-11548-1] p 379 N86-21686

**EQUIPMENT**
Airborne tracking Sun photometer apparatus and system [NASA-CASE-ARC-11622-1] p 394 N86-21982

**ERROR ANALYSIS**
State estimation errors in digital Kalman filters caused by measurement delays and numerical integration p 397 A86-28368

**ERRORS**
A constant altitude flight survey method for mapping atmospheric ambient pressures and systematic radar errors p 380 A86-28507
The application to airfoils of a technique for reducing orifice-induced pressure error at high Reynolds numbers [NASA-TP-2537] p 339 N86-20351

**EULER EQUATIONS OF MOTION**
A perturbative lambda formulation --- for compressible flow p 337 A86-28535

**EUTECTIC ALLOYS**
The evolution of turbine blade materials p 373 A86-26330

**EVALUATION**
Structural evaluation of superplastic aluminum. Part 1. Mechanical, corrosion, metallurgical data [AD-A161366] p 379 N86-21662

**EXHAUST GASES**
Proceedings of the 1985 ONR/NAVAIR Wave Rotor Research and Technology Workshop [AD-A161539] p 389 N86-20813

**EXHAUST NOZZLES**
Dual material exhaust nozzle flap [AD-D011998] p 364 N86-21548

**EXPERT SYSTEMS**
An expert system for integrated aircraft/engine controls design p 355 A86-28405
Expert systems for real time applications p 398 A86-28486
Expert system applications to the cockpit of the '90s p 399 A86-28487
An expert planner for the dynamic flight environment p 368 A86-28490
Diagnosis - Using automatic test equipment and artificial intelligence expert systems --- for F-15 aircraft p 386 A86-28492
Knowledge engineering for a flight management expert system p 368 A86-28496
The Crew Station Information Manager - An avionics expert system p 361 A86-28515
Expert System Pilot Aid p 361 A86-28516

**EXTERNAL STORES**
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987 [AD-A162792] p 402 N86-22443

**EXTREMELY HIGH FREQUENCIES**
Aircraft coupling model evaluations at SHF/EHF p 346 A86-27128

## F

**F-15 AIRCRAFT**
Diagnosis - Using automatic test equipment and artificial intelligence expert systems --- for F-15 aircraft p 386 A86-28492

**F-16 AIRCRAFT**
Multivariable control law design for the AFTI/F-16 with a failed control surface p 367 A86-28380
Knowledge engineering for a flight management expert system p 368 A86-28496
Lightning simulation tests on a graphite/epoxy airplane mockup p 355 A86-28514

**FAILURE**
F100 fuel sampling analysis [AD-A161667] p 379 N86-21707

**FAILURE ANALYSIS**
Reliability and failure prevention through ESA in the 80's And beyond p 381 A86-26937
Controlled impact demonstration airframe bending bridges p 391 N86-21943

**FAILURE MODES**
Decentralization filtering and redundancy management/failure detection for multisensor integrated navigation systems p 346 A86-26443

**FAN BLADES**
Ten years of front-fan blade forging
p 362 A86-27227
Fundamental investigation on the impact strength of hollow fan blades
[NAL-TR-879] p 389 N86-20864
**FATIGUE (MATERIALS)**
State-of-the-art review on composite material fatigue/damage tolerance
[FAA/CT-85/7] p 379 N86-21615
Structural evaluation of superplastic aluminum. Part 1. Mechanical, corrosion, metallurgical data
[AD-A161366] p 379 N86-21662
**FATIGUE LIFE**
Fatigue-crack propagation through titanium welds
p 375 A86-27264
Fatigue behaviour of titanium materials in aircraft engines p 375 A86-27275
References and conference proceedings towards the understanding of fracture mechanics
p 388 A86-29011
**FATIGUE TESTS**
Fatigue properties of Ti-10V-2Fe-03Al
p 375 A86-27274
Fretting fatigue testing with a fretting bridge equipment Stress analysis, amplitudes of slip, reliability
p 383 A86-27371
The strain controlled fatigue behaviour of a near-alpha titanium alloy p 376 A86-27383
**FAULT TOLERANCE**
Detection and isolation of control surface effectiveness failures in high performance aircraft p 367 A86-28392
An automatic redesign approach for restructurable control systems p 368 A86-28394
Digital fault tolerant flight actuation systems
p 354 A86-28400
Fault Tolerant Hardware/Software Architecture for Flight Critical Function
[AGARD-LS-143] p 369 N86-20399
Introduction to Lecture Series No. 143: Fault tolerant hardware/software architectures for flight critical functions p 369 N86-20400
Digital fly-by-wire experience p 361 N86-20401
Dependable avionic data transmission
p 362 N86-20405
Design issues in data synchronous systems
p 362 N86-20407
Digital fault-tolerant flight actuation systems
[AFWAL-83-3041] p 362 N86-20408
Design validation of fly-by-wire flight control systems
p 362 N86-20409
Integrated communication, navigation, and identification avionics: Impact analysis. Executive summary
[AD-A161799] p 388 N86-20658
**FEDERAL BUDGETS**
Oversight on the Federal Aviation Administration fiscal year 1986 research, engineering and development budget request
[GPO-46-725] p 402 N86-21447
**FEEDBACK CONTROL**
Quantitative feedback design approach to pilot-in-the-loop analysis p 366 A86-28377
YF16CCV flight control system reconfiguration design using quantitative feedback theory p 368 A86-28395
Covariance specification for the linear time-invariant output-feedback control systems using a Kalman filter
[NAL-TR-882] p 388 N86-20677
Covariance specification for the linear time-invariant output-feedback control systems using a Kalman filter
[NAL-TR-882] p 399 N86-21219
A programme of research into the aerodynamics, stability and control characteristics of a combat aircraft having a forward swept wing p 357 N86-21533
**FIBER OPTICS**
Fiber optic high speed data bus p 385 A86-28338
Imaging connector interconnect system for a parallel fiber optic data bus p 385 A86-28340
High speed fiber optic data bus for avionics integration
p 385 A86-28342
A dual channel high speed fiber optics multiplex data bus system p 386 A86-28344
Study on the digital position transducer with optical time-delay pulse
[NAL-TR-878] p 388 N86-20759
**FIBER REINFORCED COMPOSITES**
Aerospace applications of PMR polyimide composites
p 377 A86-27730
New aramid developments for aerospace/aircraft applications p 377 A86-27759
Some recent research and development of composites in Japan p 377 A86-27765
**FIELD EFFECT TRANSISTORS**
Programmable, automated transistor test system
[NASA-TP-2554] p 389 N86-21755
**FIELD OF VIEW**
Adaptive field of view expansion via multiple model filtering for tracking dynamic target images
p 350 A86-28371
**FIGHTER AIRCRAFT**
A flexible programmable signal processor for next generation fighter aircraft p 385 A86-28330
Expert systems for real time applications
p 398 A86-28486
Expert System Pilot Aid p 361 A86-28516
Modal analysis of a typical fighter aircraft using transient testing technique
[NAL-TM-ST-8517] p 356 N86-20385
Computation of transfer function matrices
[NAL-TM-SE-8509] p 399 N86-21232
F100 fuel sampling analysis
[AD-A161667] p 379 N86-21707
**FILTRATION**
A combined optimal algorithm for filtering and calculating navigation coordinates p 348 A86-28311
**FINITE DIFFERENCE THEORY**
Numerical analysis of invisicid flows about wing-fuselage combinations. 2: Development of full potential flow code YOKUDO-P
[NAL-TR-881] p 341 N86-20364
A numerical and experimental investigation of electrochemical aircraft deicing
[NASA-CR-175024] p 344 N86-20380
A viscous-inviscid interaction method to predict the aerodynamic performance of airfoils at transonic speed
[NAL-TR-873] p 341 N86-21506
**FINITE ELEMENT METHOD**
Experimental system identification for experimental/analytical correlation and modelling
p 381 A86-26883
Application of the finite element method in the calculation of transmission loss of flat and curved panels — for noise reduction in aircraft p 400 A86-26868
**FIRE CONTROL**
Onboard simulation - A demonstrated technology breakthrough for cost effective testing and training
p 360 A86-28464
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443
**FIRE FIGHTING**
Aircraft accident report: Air Canada Flight 797, McDonnell Douglas DC-9-32, C-FTLU Greater Cincinnati International Airport, Covington, Kentucky, June 2, 1983
[PB86-910402] p 344 N86-21525
**FIRE PREVENTION**
Aircraft mishap fire pattern investigations
[AD-A161094] p 314 N86-21528
**FIREPROOFING**
CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949
**FIRES**
Measurements of the response of transport aircraft ceiling panels to fuel fires p 343 A86-28564
Aircraft interior panel test criteria derived from full-scale fire tests
[AD-A161637] p 345 N86-21529
**FIXED POINTS (MATHEMATICS)**
Numerical fixed-point solution for near-optimum regulators of linear quadratic Gaussian control problems for singularly perturbed systems p 396 A86-26577
**FLAME RETARDANTS**
The 1-(diorganooxphosphonyl)methyl-2, 4- and -2, 6-dinitro and diamino benzenes and their derivatives
[NASA-CASE-ARC-11425-2] p 378 N86-20499
Segmented tubular cushion springs and spring assembly
[NASA-CASE-ARC-11349-1] p 386 N86-20797
**FLAMMABILITY**
Measurements of the response of transport aircraft ceiling panels to fuel fires p 343 A86-28564
Aircraft mishap fire pattern investigations
[AD-A161094] p 344 N86-21528
**FLAPS (CONTROL SURFACES)**
Dual material exhaust nozzle flap
[AD-D011998] p 364 N86-21548
**FLAT SURFACES**
Contact heat transfer - The last decade
p 387 A86-28551
**FLEXIBILITY**
Direct model reference adaptive control of a flexible robotic manipulator
[NASA-CR-176659] p 396 N86-22113
**FLEXIBLE BODIES**
Experimental system identification for experimental/analytical correlation and modelling
p 381 A86-26883
**FLEXIBLE WINGS**
Flight measurements of surface pressures on a flexible supercritical research wing
[NASA-TP-2501] p 339 N86-20350
**FLIGHT CONTROL**
Effects of side-stick controllers on rotorcraft handling qualities for terrain flight p 366 A86-27659
Quantitative feedback design approach to pilot-in-the-loop analysis p 366 A86-28377
Discrete maneuver flying qualities considerations in control system design p 366 A86-28378
Development of hardware for X-29A flight control system p 366 A86-28379
An integrated flight control system for a STOL transport aircraft p 367 A86-28384
Evaluation of control mixer concept for reconfiguration of flight control system p 367 A86-28393
YF16CCV flight control system reconfiguration design using quantitative feedback theory p 368 A86-28395
Lockheed-Georgia and electric primary flight control systems p 368 A86-28396
A modeling structure for computer aided design
p 397 A86-28403
Onboard simulation - A demonstrated technology breakthrough for cost effective testing and training
p 360 A86-28464
Path-finder - An hueristic approach to aircraft routing
p 368 A86-28499
Flying qualities design criteria for highly augmented systems p 369 A86-28509
Multivariable control law design for the X-29 aircraft
p 369 A86-28510
Advancing flight control technology
p 369 A86-29058
In-flight simulators p 356 A86-29299
Fault Tolerant Hardware/Software Architecture for Flight Critical Function
[AGARD-LS-143] p 369 N86-20399
Digital fault-tolerant flight actuation systems
[AFWAL-83-3041] p 362 N86-20408
Design validation of fly-by-wire flight control systems
p 362 N86-20409
**FLIGHT MANAGEMENT SYSTEMS**
An integrated flight control system for a STOL transport aircraft p 367 A86-28384
Design of direct digital flight-mode control systems for high-performance aircraft using step-response matrices
p 367 A86-28387
Evaluation of control mixer concept for reconfiguration of flight control system p 367 A86-28393
Knowledge engineering for a flight management expert system p 368 A86-28498
The Crew Station Information Manager - An avionics expert system p 361 A86-28515
Expert System Pilot Aid p 361 A86-28516
**FLIGHT MECHANICS**
Matrix equations of the spatial flight of an asymmetrical rigid body p 365 A86-27446
The development of microcomputer codes for studying the flight dynamics and performance of helicopters
p 366 A86-27660
Flight mechanics contributions to the time-based trajectory control in the aircraft longitudinal plane --- German thesis p 348 A86-27852
**FLIGHT OPTIMIZATION**
Real time optimal flight path generation by storage of massive data bases p 397 A86-28388
**FLIGHT PATHS**
Real time optimal flight path generation by storage of massive data bases p 397 A86-28388
An expert planner for the dynamic flight environment
p 368 A86-28490
Path-finder - An hueristic approach to aircraft routing
p 368 A86-28499
**FLIGHT PLANS**
An expert planner for the dynamic flight environment
p 368 A86-28490
General aviation pilot and aircraft activity survey
[AD-A161665] p 345 N86-21530
**FLIGHT RECORDERS**
Controlled impact demonstration flight data recorders/cockpit voice recorders p 391 N86-21944
United States Navy - Canadian forces solid state flight data recorder/crash position locator experiment on the B-720 controlled impact demonstration
p 391 N86-21945
CID-720 aircraft high-environment flight instrumentation system p 392 N86-21947
CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949
**FLIGHT SAFETY**
Ultralight aircraft - A need for better regulation than 14 C.F.R. Section 103 — in air law p 343 A86-28000

**FLIGHT SIMULATION**
Future applications and prospects for flight simulation; Proceedings of the Spring Convention, London, England, May 9, 10, 1984 p 370 A86-28278
Data-driven operating concepts for real-time simulation systems p 397 A86-28348
Avoiding probe to model collisions in wind tunnel testing p 397 A86-28413
Onboard simulation - A demonstrated technology breakthrough for cost effective testing and training p 360 A86-28464
Design considerations for on-board simulation p 360 A86-28465
A ring-vortex downburst model for flight simulations p 393 A86-28568
Evaluation of 16 measures of mental workload using a simulated flight task emphasizing mediational activity p 395 A86-28864

**FLIGHT SIMULATORS**
Future applications and prospects for flight simulation; Proceedings of the Spring Convention, London, England, May 9, 10, 1984 p 370 A86-28278
Low cost part task trainer for the GBU-15 guided bomb p 370 A86-28457
Modular simulators - A comprehensive unified architecture --- for flight training p 371 A86-28458
Modular simulators - Is a local area network sufficient? --- for use in flight simulators p 371 A86-28460
Instructor station for the ILLIMAC general aviation instrument training simulator p 371 A86-28462
In-flight simulators p 356 A86-29299
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**FLIGHT STABILITY TESTS**
Flight testing of an ASW helicopter p 352 A86-26585
The development of microcomputer codes for studying the flight dynamics and performance of helicopters p 366 A86-27660

**FLIGHT TEST INSTRUMENTS**
Flight Test Instrumentation System FTIS for type-certification of the Indonesian aircraft CN 235 p 358 A86-27818
CID-720 aircraft high-environment flight instrumentation system p 392 N86-21947
CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949

**FLIGHT TESTS**
Helicopter flight test demonstration of differential GPS p 345 A86-26438
Commercial aviation GPS Navigation Set flight test results p 346 A86-26507
Civil helicopter flight operations using differential GPS p 346 A86-26509
Flight testing of an ASW helicopter p 352 A86-26585
Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics p 353 A86-27661
TSPI data processing in the telemetry environment --- Time Space Position Information for flight tests p 347 A86-27804
Rotating aerodynamic exciters for in-flight flutter testing p 353 A86-27820
Flight tests of MLS elevation guidance p 348 A86-27899
Control of the flight testing of aircraft as a means of increasing their reliability p 397 A86-28307
JTIDS RELNAV performance evaluation --- Joint Tactical Information Distribution System in relative air navigation p 350 A86-28369
LANTIRN flight test - Opening the night window --- Low Altitude Navigation and Targeting Infrared System for Night p 361 A86-28842
CAD/CAM supports flight test modifications p 356 A86-29823
Wind shear measurement on board a Morane 893 p 394 N86-21084
Comparison of airborne data acquisition systems at ARL (Aeronautical Research Laboratories)
[AD-A161664] p 357 N86-21537
Relative accuracy of ALPEX aircraft data: An evaluation of the ALPEX intercomparison flight with the NCAR (National Center for Atmospheric Research) Electra, the NOAA (National Oceanic and Atmospheric Administration P3 and the DFVLR (Deutsche Forschungs- und Versuchsanstalt fuer Luft-und Raumfahrt) Falcon
[PB86-100823] p 394 N86-22067

**FLIGHT TRAINING**
Modular simulators - How to make it work --- procurement and logistics for flight-weapon system trainer p 371 A86-28459

**FLOODS**
Preliminary floor, seat, and dummy data p 391 N86-21942

**FLOW DIRECTION INDICATORS**
Wind tunnel calibration of a flow direction sensor and a pilot-static tube to high angles of attack and sideslip p 359 A86-28364

**FLOW DISTRIBUTION**
Nonlinear analysis of pressure oscillations in ramjet engines
[AIAA PAPER 86-0001] p 363 A86-26601
Reconstruction of a three-dimensional, transonic rotor flow field from holographic interferogram data
[AIAA PAPER 85-0370] p 337 A86-27669
Numerical optimization design of advanced transonic wing configurations p 356 A86-28562
Side force characteristics of a 20 deg cone at high angles of attack
[NAL-TM-AE-8503] p 340 N86-20356
Particle trajectory computation on a 3-dimensional engine inlet
[NASA-CR-175023] p 344 N86-20379
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**FLOW MEASUREMENT**
Theoretical and experimental investigations of flow vector measurements with angle-of-attack and sideslip sensors on DFVLR meteorological research aircraft
[DFVLR-FB-85-50] p 358 N86-21541

**FLOW THEORY**
Aerodynamics. Part 1 - Fundamentals of theory. Aerodynamics of an airfoil and a wing --- Book p 338 A86-29840

**FLOW VISUALIZATION**
A visualisation study of the vortex flow around double-delta wings
[ARL-AERO-R-165] p 340 N86-20362
New techniques for experimental generation of two-dimensional blade-vortex interaction at low Reynolds numbers
[NASA-TP-2551] p 401 N86-21280
A new method for laminar boundary layer transition visualization in flight: Color changes in liquid crystal coatings
[NASA-TM-87666] p 342 N86-21518

**FLUID DYNAMICS**
Tail profile effects on unsteady large scale flow structure in the wing and plate junction p 387 A86-28666

**FLUID FLOW**
Two methods for viscous and inviscid free-wake analysis of helicopter rotors
[AD-A161513] p 342 N86-21521

**FLUTTER**
A loss of dynamic stability of the torsional vibrations of blades due to cascade flutter p 364 A86-27543
Rotating aerodynamic exciters for in-flight flutter testing p 353 A86-27820

**FLUTTER ANALYSIS**
Linear and nonlinear modal analysis of aeroelastic structural systems p 387 A86-28742

**FLY BY WIRE CONTROL**
Development of hardware for X-29A flight control system p 366 A86-28379
Microprocessor controlled and managed fly-by-wire hydraulic actuator p 366 A86-28401
A survivable fly-by-wire spoiler actuation system featuring nonflammable fluid, 8,000 PSI hydraulics and direct drive valves p 355 A86-28402
Flying qualities design criteria for highly augmented systems p 369 A86-28509
Advancing flight control technology p 369 A86-29058
Digital fly-by-wire experience p 361 N86-20401
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**FORCE DISTRIBUTION**
Side force characteristics of a 20 deg cone at high angles of attack
[NAL-TM-AE-8503] p 340 N86-20356
Lift distribution on a high aspect ratio circulation control wing with root lift cutout
[AD-A157024] p 341 N86-20368

**FORCED VIBRATION**
Forced response analysis of an aerodynamically detuned supersonic turbomachine rotor p 363 A86-26902

**FORGING**
The thermo-mechanical processing during closed die forging - A method of improving aeronautical materials p 380 A86-26336
Ten years of front-fan blade forging p 382 A86-27227
Effect of processing and heat treatment on the mechanical properties of Ti-6Al-2Sn-4Zr-6Mo alloy p 375 A86-27231
Isothermal forging system for the production of large rotating components from titanium alloys or superalloys p 382 A86-27247
Fatigue properties of Ti-10V-2Fe-03Al p 375 A86-27274

**FORMULAS (MATHEMATICS)**
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**FORTRAN**
A FORTRAN algorithm for terrain perspective and plan view display p 396 A86-28421

**FOURIER SERIES**
Vortex conception of rotor and mutual effect of screw/propellers
[NASA-TM-77979] p 342 N86-21510

**FRACTURE MECHANICS**
References and conference proceedings towards the understanding of fracture mechanics p 386 A86-29011
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**FREE FLIGHT**
Research on the aerodynamic characteristics of vehicles by free flight testing at supersonic speeds
[NAL-TR-876] p 339 N86-20353

**FREE VIBRATION**
Applying I. G. Bubnov's method to the solution of the natural vibration problem for a conical sandwich panel p 384 A86-28315

**FREQUENCY MODULATION**
Frequency synthesis type airborne transmitters p 347 A86-27819

**FREQUENCY RANGES**
Use of skin damping treatments to control airframe dynamic response for interior noise control p 389 N86-21919

**FREQUENCY SHIFT KEYING**
Noise immunity of signals with minimum FSK p 383 A86-27492

**FRETTING**
The fretting fatigue behaviour of the titanium alloy Ti-6Al-4V p 376 A86-27370
Fretting fatigue testing with a fretting bridge equipment Stress analysis, amplitudes of slip, reliability p 383 A86-27371

**FRETTING CORROSION**
Fatigue behaviour of titanium materials in aircraft engines p 375 A86-27275

**FRICTION**
Runway rubber removal specification development
[DOT/FAA/PN-85/33] p 372 N86-21556

**FUEL CELLS**
Ultrasonic liquid quantity measurement --- in oils p 360 A86-28478

**FUEL CONSUMPTION**
Will 1990s aircraft be powered by propfan or advanced turbofan? p 383 A86-26370
Method for improving the fuel efficiency of a gas turbine engine
[NASA-CASE-LEW-13142-2] p 364 N86-20389
General aviation pilot and aircraft activity survey
[AD-A161665] p 345 N86-21530

**FUEL OILS**
Ultrasonic liquid quantity measurement --- in oils p 360 A86-28478

**FUEL PUMPS**
Control of a high-speed, brushless dc motor driven through a cycloconverter line --- for aircraft fuel pumps p 386 A86-28372
F100 fuel sampling analysis
[AD-A161667] p 379 N86-21707

**FUEL SYSTEMS**
Method for improving the fuel efficiency of a gas turbine engine
[NASA-CASE-LEW-13142-2] p 364 N86-20389
F100 fuel sampling analysis
[AD-A161667] p 379 N86-21707

**FUELS**
F100 fuel sampling analysis
[AD-A161667] p 379 N86-21707

**FULL SCALE TESTS**
Aircraft interior panel test criteria derived from full-scale fire tests
[AD-A161637] p 345 N86-21529

**FUSELAGES**
Aerodynamic characteristics of several current helicopter tail boom cross sections including the effect of spoilers
[NASA-TP-2506] p 339 N86-20349
Laminated damped fuselage structures p 389 N86-21916

Integrated damped fuselage structure p 389 N86-21918

CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949

**FUZZY SYSTEMS**

Application of fuzzy logic to the estimation of software reliability for computer systems p 396 A86-27472

## G

**GAS FLOW**

Proceedings of the 1985 ONR/NAVAIR Wave Rotor Research and Technology Workshop [AD-A161539] p 389 N86-20813

**GAS PRESSURE**

Proceedings of the 1985 ONR/NAVAIR Wave Rotor Research and Technology Workshop [AD-A161539] p 389 N86-20813

**GAS TURBINE ENGINES**

Embrittled trailing edges of compressor blades (titanium alloy Ti6Al-4V and Ti6Al2Sn4Zr2Mo) of gas turbine aero-engines p 376 A86-27279

A unified method for evaluating the strength and reliability of the blades of the axial-flow compressors and gas turbines of aircraft engines p 364 A86-28317

Asymmetric thrust warning system for dual engine aircraft [AD-D011960] p 361 N86-20387

Method for improving the fuel efficiency of a gas turbine engine [NASA-CASE-LEW-13142-2] p 364 N86-20389

Fuel property effects on combustion [AD-A162451] p 378 N86-20522

Proceedings of the 1985 ONR/NAVAIR Wave Rotor Research and Technology Workshop [AD-A161539] p 389 N86-20813

**GENERAL AVIATION AIRCRAFT**

Light aircraft - The way ahead in design and operation; Proceedings of the Symposium, Loughborough, England, March 31, April 1, 1984 p 354 A86-28093

Effects of wing modification on an aircraft's aerodynamic parameters as determined from flight data [NASA-TM-87591] p 370 N86-21550

**GEOMAGNETISM**

Avner Electronic Magnetic Compass and low cost navigation system p 358 A86-26504

**GLASS FIBERS**

S-2 glass fiber - Its role in military applications p 377 A86-27702

**GLOBAL POSITIONING SYSTEM**

Helicopter flight test demonstration of differential GPS p 345 A86-26438

Commercial aviation GPS Navigation Set flight test results p 346 A86-26507

Civil helicopter flight operations using differential GPS p 346 A86-26509

GPS aided inertial navigation p 351 A86-29300

**GRAPHITE-EPOXY COMPOSITES**

Lightning simulation tests on a graphite/epoxy airplane mockup p 355 A86-26514

Strength of graphite/epoxy bolted wing-skin splice specimens subjected to outdoor exposure under constant load and yearly fatigue loading [NASA-TP-2542] p 378 N86-20508

**GRAPHITE-POLYIMIDE COMPOSITES**

Aerospace applications of PMR polyimide composites p 377 A86-27730

**GRAY SCALE**

Electronic display luminance and grey scale control --- for military aircraft p 360 A86-28505

**GROUND EFFECT MACHINES**

Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987 [AD-A162792] p 402 N86-22443

**GROUND HANDLING**

Thrust-vectored takeoff, landing, and ground handling of an airship p 343 A86-28571

**GROUND STATIONS**

Flight Test Instrumentation System FTIS for type-certification of the Indonesian aircraft CN 235 p 358 A86-27818

Design considerations for Doppler VOR ground station antenna arrangement p 349 A86-28360

**GUIDANCE SENSORS**

The use of microcomputers in inertial navigation systems with strapdown sensors and for measurement systems of average accuracy --- German thesis p 347 A86-27849

**GUST LOADS**

Comparison of discrete and continuous gust methods for airplane design loads determination p 356 A86-28567

Optimal airframe synthesis for gust loads [NASA-CR-178047] p 357 N86-20386

## H

**HARDWARE**

Development of hardware for X-29A flight control system p 366 A86-28379

Fault Tolerant Hardware/Software Architecture for Flight Critical Function [AGARD-LS-143] p 369 N86-20399

**HARNESSES**

Controlled impact demonstration seat/cabin restraint systems: FAA p 390 N86-21937

**HAZARDS**

The Stapleton microburst advisory service project: An operational viewpoint [AD-A161543] p 394 N86-21078

**HEAD-UP DISPLAYS**

Application of magneto-optic modulators to advanced avionic displays p 360 A86-28506

Head-up/head-down transition - Measurement of transition times p 396 A86-29092

**HEAT PIPES**

Improved reliability of electronic circuits through the use of heat pipes p 386 A86-28479

**HEAT RESISTANT ALLOYS**

The evolution of turbine blade materials p 373 A86-26330

Isothermal forging system for the production of large rotating components from titanium alloys or superalloys p 382 A86-27247

Studies on crack growth rate of high temperature titanium alloys p 376 A86-27384

Developments in high temperature alloys p 376 A86-27388

**HEAT SHIELDING**

CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949

**HEAT TRANSFER**

Contact heat transfer - The last decade p 387 A86-28551

**HEAT TRANSMISSION**

Contact heat transfer - The last decade p 387 A86-28551

**HEAT TREATMENT**

Effect of processing and heat treatment on the mechanical properties of Ti-6Al-2Sn-4Zr-6Mo alloy p 375 A86-27231

**HEATING**

Method for improving the fuel efficiency of a gas turbine engine [NASA-CASE-LEW-13142-2] p 364 N86-20389

**HEATING EQUIPMENT**

A numerical and experimental investigation of electrochemical aircraft deicing [NASA-CR-175024] p 344 N86-20380

**HELICOPTER CONTROL**

Kinematic observers for rotor control p 366 A86-27664

Limiting performance of nonlinear systems with applications to helicopter vibration control [AD-A161457] p 370 N86-21551

A contribution to the digital compensation of periodic disturbances with frequencies in bounded intervals --- in helicopters [DFVLR-FB-85-55] p 370 N86-21553

**HELICOPTER DESIGN**

Application of modern structural optimization to vibration reduction in rotorcraft p 352 A86-26587

International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings p 335 A86-27651

Optimal design of composite power transmission shafting p 353 A86-27654

Army 21 - Aviation --- strategic and tactical operational concept p 355 A86-28454

**HELICOPTER PERFORMANCE**

Flight testing of an ASW helicopter p 352 A86-26585

Low-speed stability characteristics of a helicopter with a sling load p 365 A86-26586

Realtime piloted simulation investigation of helicopter flying qualities during approach and landing on nonaviation ships [AIAA PAPER 86-0490] p 365 A86-26642

The development of microcomputer codes for studying the flight dynamics and performance of helicopters p 366 A86-27660

Helicopter performance computer programs for HP-41 hand-held computer [AD-A162794] p 358 N86-21539

**HELICOPTER PROPELLER DRIVE**

Optimal design of composite power transmission shafting p 353 A86-27654

**HELICOPTER TAIL ROTORS**

Reconstruction of a three-dimensional, transonic rotor flow field from holographic interferogram data [AIAA PAPER 85-0370] p 337 A86-27669

Aerodynamic characteristics of several current helicopter tail boom cross sections including the effect of spoilers [NASA-TP-2506] p 339 N86-20349

**HELICOPTER WAKES**

A wake model for high resolution airloads p 336 A86-27666

Free wake model of hovering rotors having straight or curved blades p 337 A86-27667

Material contravariant components - Vorticity transport and vortex theorems p 387 A86-28553

Two methods for viscous and inviscid free-wake analysis of helicopter rotors [AD-A161513] p 342 N86-21521

**HELICOPTERS**

Civil helicopter flight operations using differential GPS p 346 A86-26509

Modal test requirements for coupled structure analysis using experimentally-derived component models p 380 A86-26878

Helicopter model rotor-blade vortex interaction impulsive noise - Scalability and parametric variations p 400 A86-27658

Effects of side-stick controllers on rotorcraft handling qualities for terrain flight p 366 A86-27659

Structural dynamic aspects of rotor antiresonant isolation p 353 A86-27663

Helicopter Airworthiness Symposium, 19th, London, England, December 19, 1984, Proceedings p 354 A86-28281

Detection of non-moving targets by airborne mm-wave radars p 351 A86-29783

The role of vibration and rattle in human response to helicopter noise [AD-A162486] p 396 N86-22110

**HELMET MOUNTED DISPLAYS**

Application of magneto-optic modulators to advanced avionic displays p 360 A86-28506

**HETEROCYCLIC COMPOUNDS**

Conductive heterocyclic ladder polymers [AD-D011915] p 378 N86-20569

**HEURISTIC METHODS**

Path-finder - An hueristic approach to aircraft routing p 368 A86-28499

Development of a computerised method of determining aircraft maintenance intervals [AD-A161339] p 336 N86-21500

**HEXAGONAL CELLS**

The strain controlled fatigue behaviour of a near-alpha titanium alloy p 376 A86-27383

**HIGH FREQUENCIES**

High frequency-heated air turbojet [NASA-TM-77710] p 364 N86-21543

**HIGH SPEED CAMERAS**

Controlled impact demonstration on-board (interior) photographic system p 392 N86-21946

**HIGH SPEED PHOTOGRAPHY**

Controlled impact demonstration on-board (interior) photographic system p 392 N86-21946

**HIGH STRENGTH ALLOYS**

Structural evaluation of superplastic aluminum. Part 1. Mechanical, corrosion, metallurgical data [AD-A161366] p 379 N86-21662

**HIGH STRENGTH STEELS**

The development of high strength stainless steels for the aeronautical industry p 373 A86-26337

**HIGH TEMPERATURE TESTS**

High temperature fatigue behavior of IMI 685 p 376 A86-27385

Developments in high temperature alloys p 376 A86-27388

CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949

**HOLOGRAPHIC INTERFEROMETRY**

Reconstruction of a three-dimensional, transonic rotor flow field from holographic interferogram data [AIAA PAPER 85-0370] p 337 A86-27669

**HOLOGRAPHY**

Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987 [AD-A162792] p 402 N86-22443

**HORIZONTAL FLIGHT**

Dynamic stability of hingeless and bearingless rotors in forward flight p 366 A86-27662

**HOT PRESSING**

Titanium near net shape components for demanding airframe applications p 380 A86-26717

An evaluation of centrifugally cast Ti-4Al-4Mo-2Sn-0.5Si (IMI 550) alloy p 374 A86-27207

**HOVERING**

Free wake model of hovering rotors having straight or curved blades p 337 A86-27667

Reconstruction of a three-dimensional, transonic rotor flow field from holographic interferogram data [AIAA PAPER 85-0370] p 337 A86-27669

Aerodynamic characteristics of several current helicopter tail boom cross sections including the effect of spoilers [NASA-TP-2506] p 339 N86-20349

Effects of planform geometry on hover performance of a 2-meter-diameter model of a four-bladed rotor [NASA-TM-87607] p 340 N86-20358

Helicopter performance computer programs for HP-41 hand-held computer [AD-A162794] p 358 N86-21539

**HUMAN BEHAVIOR**

Aircraft accident report: Air Canada Flight 797, McDonnell Douglas DC-9-32, C-FTLU Greater Cincinnati International Airport, Covington, Kentucky, June 2, 1983 [PB86-910402] p 344 N86-21525

**HUMAN FACTORS ENGINEERING**

Colour design in aviation cartography p 358 A86-28066

Auditory signals in military aircraft - Ergonomic principles versus practice p 395 A86-28442

A speech recognition research tool for the C-130 Hercules p 350 A86-28443

**HUMAN REACTIONS**

The role of vibration and rattle in human response to helicopter noise [AD-A162486] p 396 N86-22110

**HYDRAULIC CONTROL**

A contribution to the digital compensation of periodic disturbances with frequencies in bounded intervals --- in helicopters [DFVLR-FB-85-55] p 370 N86-21553

**HYDROGEN EMBRITTLEMENT**

Embrittled trailing edges of compressor blades (titanium alloy Ti6Al-4V and Ti6Al2Sn4Zr2Mo) of gas turbine aero-engines p 376 A86-27279

**HYPERSONIC FLOW**

Numerical analysis of nonequilibrium flow about airfoil in thin shock layer approximation p 343 N86-22258

**HYPOTHERMIA**

Ship/rig personnel abandonment and helicopter crew/passenger immersion suits - The requirements in the North Atlantic p 396 A86-29100

**HYSTERESIS**

Mathematical models for studying aircraft vibrations with allowance for structural hysteresis p 365 A86-27081

## I

**ICE FORMATION**

Verification and application of the icing scaling equations [AIAA PAPER 86-0481] p 343 A86-26640

Particle trajectory computation on a 3-dimensional engine inlet [NASA-CR-175023] p 344 N86-20379

The icing research aircraft DO28, D-IFMP of DFVLR, and its measuring equipment [DFVLR-MITT-85-12] p 394 N86-22064

**IMPACT**

Galley and overhead compartment experiment results: Full-scale transport controlled impact demonstration [DOT/FAA/CT-85/33] p 343 N86-20378

**IMPACT DAMAGE**

Preliminary floor, seat, and dummy data p 391 N86-21942

Controlled impact demonstration airframe bending bridges p 391 N86-21943

**IMPACT LOADS**

CID overview p 390 N86-21934

CID flight/impact p 390 N86-21935

Controlled impact demonstration seat/cabin restraint systems: FAA p 390 N86-21937

**IMPACT STRENGTH**

Fundamental investigation on the impact strength of hollow fan blades [NAL-TR-879] p 389 N86-20864

**IMPACT TESTS**

Fundamental investigation on the impact strength of hollow fan blades [NAL-TR-879] p 389 N86-20864

Full-Scale Transport controlled Impact Demonstration [NASA-CP-2395] p 390 N86-21933

NASA seat experiment and occupant responses p 390 N86-21939

Structural loads preliminary results p 391 N86-21940

Preliminary floor, seat, and dummy data p 391 N86-21942

Controlled impact demonstration flight data recorders/cockpit voice recorders p 391 N86-21944

United States Navy - Canadian forces solid state flight data recorder/crash position locator experiment on the B-720 controlled impact demonstration p 391 N86-21945

Controlled impact demonstration on-board (interior) photographic system p 392 N86-21946

CID-720 aircraft high-environment flight instrumentation system p 392 N86-21947

Impact dynamics instrumentation p 392 N86-21948

CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949

**IN-FLIGHT MONITORING**

Flight Test Instrumentation System FTIS for type-certification of the Indonesian aircraft CN 235 p 358 A86-27818

Rotating aerodynamic exciters for in-flight flutter testing p 353 A86-27820

**INCOMPRESSIBLE BOUNDARY LAYER**

Three-dimensional and unsteady boundary-layer computations p 396 A86-29415

**INCOMPRESSIBLE FLOW**

A perturbative lambda formulation --- for compressible flow p 337 A86-26535

Material contravariant components - Vorticity transport and vortex theorems p 387 A86-26553

**INDEXES (DOCUMENTATION)**

Publications of the National Bureau of Standards, 1984 catalog [PB85-245678] p 402 N86-21435

**INDUCTION MOTORS**

Aircraft electrical power systems p 364 A86-26508

**INERTIAL GUIDANCE**

STALINS method for takeoff and landing trajectory measurements p 356 A86-26566

**INERTIAL NAVIGATION**

The use of microcomputers in inertial navigation systems with strapdown sensors and for measurement systems of average accuracy --- German thesis p 347 A86-27649

A combined optimal algorithm for filtering and calculating navigation coordinates p 348 A86-28311

Navigation methodology - An investigation of an inertial navigation system (INS) enhancement p 349 A86-28356

Concept and performance analysis of a strapdown northfinder p 349 A86-28361

GPS aided inertial navigation p 351 A86-29300

**INFORMATION SYSTEMS**

Comparison of airborne data acquisition systems at ARL (Aeronautical Research Laboratories) [AD-A161664] p 367 N86-21537

**INFRARED IMAGERY**

Adaptive field of view expansion via multiple model filtering for tracking dynamic target images p 359 A86-28371

**INFRARED INSTRUMENTS**

LANTIRN flight test - Opening the night window --- Low Altitude Navigation and Targeting Infrared System for Night p 361 A86-28842

**INFRARED TRACKING**

Adaptive field of view expansion via multiple model filtering for tracking dynamic target images p 359 A86-28371

**INLET FLOW**

Nonlinear analysis of pressure oscillations in ramjet engines [AIAA PAPER 86-0001] p 383 A86-26601

Particle trajectory computation on a 3-dimensional engine inlet [NASA-CR-175023] p 344 N86-20379

**INSTALLATION MANUALS**

Method for the prediction of the installation aerodynamics of a propfan at subsonic speeds: User manual [NASA-CR-178057] p 340 N86-20360

**INSTRUMENT ERRORS**

Errare humanum est . . . sed perseverare diabolicum or navigation errors of the 747 and the 'heading' position p 348 A86-27900

Optimum maintenance of aircraft systems on the basis of their condition with allowance for measurement errors p 354 A86-28310

**INSTRUMENT LANDING SYSTEMS**

Performance of a commercial transport under typical MLS noise environment [NASA-CR-178032] p 352 N86-20384

**INTERACTIONAL AERODYNAMICS**

Analysis of the wing/rotor and rotor/rotor interactions present in tilt-rotor aircraft p 353 A86-27857

Comment on 'Conical similarity of shock/boundary-layer interactions generated by swept and unswept wings' p 337 A86-28558

**INTERFERENCE IMMUNITY**

Noise immunity of signals with minimum FSK p 383 A86-27492

**INTERPOLATION**

Interpolation of heights and slopes from a digital terrain elevation model [BAE-BT-13198] p 352 N86-20392

**INTERPROCESSOR COMMUNICATION**

Imaging connector interconnect system for a parallel fiber optic data bus p 385 A86-28340

**INTERVALS**

Development of a computerised method of determining aircraft maintenance intervals [AD-A161339] p 336 N86-21500

**INVESTMENT CASTING**

Titanium investment casting - Production, properties and applications p 382 A86-27204

**INVISCID FLOW**

Material contravariant components - Vorticity transport and vortex theorems p 387 A86-28553

Numerical analysis of inviscid flows about wing-fuselage combinations. 2: Development of full potential flow code YOKUDO-P [NAL-TR-861] p 341 N86-20364

A viscous-inviscid interaction method to predict the aerodynamic performance of airfoils at transonic speed [NAL-TR-873] p 341 N86-21506

Two methods for viscous and inviscid free-wake analysis of helicopter rotors [AD-A161513] p 342 N86-21521

**IONS**

Comparison of computational results of a few representative three-dimensional transonic potential flow analysis programs [NASA-TM-77963] p 341 N86-21509

**ISENTROPIC PROCESSES**

Material contravariant components - Vorticity transport and vortex theorems p 387 A86-28553

**ISOSTATIC PRESSURE**

Titanium near net shape components for demanding airframe applications p 380 A86-28717

**ISOTHERMAL PROCESSES**

Isothermal forging system for the production of large rotating components from titanium alloys or superalloys p 382 A86-27247

## J

**JAPAN**

Japan report: Science and technology [JPRS-JST-86-001] p 389 N86-21723

**JET AIRCRAFT**

Installation effects of long-duct pylon-mounted nacelles on a twin-jet transport model with swept supercritical wing [NASA-TP-2457] p 339 N86-20346

Aircraft interior panel test criteria derived from full-scale fire tests [AD-A161637] p 345 N86-21529

F100 fuel sampling analysis [AD-A161667] p 379 N86-21707

**JET ENGINE FUELS**

Fuel property effects on combustion [AD-A162451] p 378 N86-20522

**JET ENGINES**

Effect of processing and heat treatment on the mechanical properties of Ti-6Al-2Sn-4Zr-6Mo alloy p 375 A86-27231

Jet engine operating and support cost estimating relationship development [AD-A161683] p 364 N86-21547

F100 fuel sampling analysis [AD-A161667] p 379 N86-21707

**JET EXHAUST**

Jet plume temperature effects on afterbody pressure distribution and drag [NAL-TM-FM-8502] p 340 N86-20354

**JET FLOW**

Characteristics of the effect of the powerplant jet streams on the design of VTOL aircraft p 354 A86-26320

## K

**KALMAN FILTERS**

Decentralization filtering and redundancy management/failure detection for multisensor integrated navigation systems p 346 A86-26443

State estimation errors in digital Kalman filters caused by measurement delays and numerical integration p 397 A86-26368

An adaptive UD-factorized Kalman filter for real-time tactical aircraft Track-While-Scan systems p 350 A86-26370

Adaptive field of view expansion via multiple model filtering for tracking dynamic target images
p 359 A86-28371
Covariance specification for the linear time-invariant output-feedback control systems using a Kalman filter
[NAL-TR-882] p 388 N86-20677
Covariance specification for the linear time-invariant output-feedback control systems using a Kalman filter
[NAL-TR-882] p 399 N86-21219

KENTUCKY
Aircraft accident report: Air Canada Flight 797, McDonnell Douglas DC-9-32, C-FTLU Greater Cincinnati International Airport, Covington, Kentucky, June 2, 1983
[PB86-910402] p 344 N86-21525

KEROSENE
Full-Scale Transport controlled Impact Demonstration
[NASA-CP-2395] p 390 N86-21933

KEVLAR (TRADEMARK)
Life prediction for aromatic polyamide reinforcements
p 377 A86-27691
New aramid developments for aerospace/aircraft applications p 377 A86-27759

L

LABORATORIES
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

LAMINAR FLOW
A new method for laminar boundary layer transition visualization in flight: Color changes in liquid crystal coatings
[NASA-TM-87666] p 342 N86-21518

LAMINATES
The damping capacity of layered materials
p 374 A86-27084
Laminated damped fuselage structures
p 389 N86-21916

LANDING AIDS
A new system simultaneously covering en route navigation and landing p 348 A86-27898

LANDING GEAR
Development of materials used in landing gear
p 373 A86-26329
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

LAUNCHING
Research on the aerodynamic characteristics of vehicles by free flight testing at supersonic speeds
[NAL-TR-876] p 339 N86-20353

LEADING EDGE FLAPS
A new and less complex alternative to the Handley Page slat p 356 A86-28563

LEADING EDGE SLATS
A new and less complex alternative to the Handley Page slat p 356 A86-28563

LEADING EDGES
An attached flow design of a noninterfering leading-edge extension to a thick delta wing p 337 A86-28569
A visualisation study of the vortex flow around double-delta wings
[ARL-AERO-R-165] p 340 N86-20362
Effects of wing modification on an aircraft's aerodynamic parameters as determined from flight data
[NASA-TM-87591] p 370 N86-21550

LEARNING MACHINES
Instructor station for the ILLIMAC general aviation instrument training simulator p 371 A86-28462

LEAST SQUARES METHOD
Efficient identification of critical stresses in structures subject to dynamic loads p 380 A86-26682

LIFE (DURABILITY)
Life prediction for aromatic polyamide reinforcements
p 377 A86-27691

LIFT
Lift distribution on a high aspect ratio circulation control wing with root lift cutout
[AD-A157024] p 341 N86-20368

LIFT DEVICES
Procedure for utilizing the lift and thrust forces of ornithopters
[NASA-TM-77682] p 357 N86-21534

LIFT DRAG RATIO
An experimental study of the lift, drag and static longitudinal stability for a three lifting surface configuration
[AIAA PAPER 86-0398] p 365 A86-26629

LIFTING BODIES
An experimental study of the lift, drag and static longitudinal stability for a three lifting surface configuration
[AIAA PAPER 86-0398] p 365 A86-26629

LIGHT AIRCRAFT
Light aircraft - The way ahead in design and operation; Proceedings of the Symposium, Loughborough, England, March 31, April 1, 1984 p 354 A86-28093
Aircraft of special configurations --- Russian book
p 335 A86-28521

LIGHT MODULATION
Application of magneto-optic modulators to advanced avionic displays p 360 A86-28506

LIGHTING EQUIPMENT
Obstruction marking and lighting
[AC-70/7460-1G] p 371 N86-20410
Controlled impact demonstration on-board (interior) photographic system p 392 N86-21946

LIGHTNING
Lightning simulation tests on a graphite/epoxy airplane mockup p 355 A86-28514

LIGHTNING SUPPRESSION
Weather radar studies
[AD-A161622] p 394 N86-22061

LINEAR SYSTEMS
Numerical fixed-point solution for near-optimum regulators of linear quadratic Gaussian control problems for singularly perturbed systems p 396 A86-26577

LIQUID CHROMATOGRAPHY
Development of LC-13C NMR
[NASA-CR-176656] p 379 N86-21704

LIQUID CRYSTALS
A new method for laminar boundary layer transition visualization in flight: Color changes in liquid crystal coatings
[NASA-TM-87666] p 342 N86-21518

LITHIUM ALLOYS
The new aluminium alloys for the aeronautical industry
p 373 A86-26334
Strength profile in Al-Li plate material
p 374 A86-27198

LOADS (FORCES)
Structural loads preliminary results
p 391 N86-21940
Controlled impact demonstration airframe bending bridges p 391 N86-21943

LOCKHEED AIRCRAFT
Aircraft accident report: Galaxy Airlines, Inc., Lockheed Electra-L-188C, N5532, Reno, Nevada, January 21, 1985
[PB86-910401] p 344 N86-21526

LOGIC
Application of fuzzy logic to the estimation of software reliability for computer systems p 396 A86-27472

LOGISTICS MANAGEMENT
Modular simulators - How to make it work --- procurement and logistics for flight-weapon system trainer
p 371 A86-28459
Data systems for logistics evaluation during operational test p 398 A86-28483

LONGITUDINAL CONTROL
Subsonic flow investigations on a cranked wing designed for high maneuverability
[NASA-CR-178046] p 340 N86-20361

LONGITUDINAL STABILITY
An experimental study of the lift, drag and static longitudinal stability for a three lifting surface configuration
[AIAA PAPER 86-0398] p 365 A86-26629

LOW ALTITUDE
LANTIRN flight test - Opening the night window --- Low Altitude Navigation and Targeting Infrared System for Night p 361 A86-28842
The Stapleton microburst advisory service project: An operational viewpoint
[AD-A161543] p 394 N86-21078
Weather radar studies
[AD-A161622] p 394 N86-22061

LOW ASPECT RATIO WINGS
Numerical analysis of nonequilibrium flow about airfoil in thin shock layer approximation p 343 N86-22258

LOW COST
Avner Electronic Magnetic Compass and low cost navigation system p 358 A86-26504
Low cost part task trainer for the GBU-15 guided bomb p 370 A86-28457

LOW PASS FILTERS
Digital filtering and acceleration pulse interpretation
p 400 N86-21941

LOW SPEED STABILITY
Low-speed stability characteristics of a helicopter with a sling load p 365 A86-26586

LUBRICANTS
Synthetic lubricants and working fluids; International Colloquium, 4th, Esslingen, West Germany, January 10-12, 1984, Reports p 378 A86-28096

LUMINANCE
Electronic display luminance and grey scale control --- for military aircraft p 360 A86-28505

M

MAGNETIC COMPASSES
Avner Electronic Magnetic Compass and low cost navigation system p 358 A86-26504

MAGNETO-OPTICS
Application of magneto-optic modulators to advanced avionic displays p 360 A86-28506

MAN MACHINE SYSTEMS
Auditory signals in military aircraft - Ergonomic principles versus practice p 395 A86-28442
A speech recognition research tool for the C-130 Hercules p 350 A86-28443
Dynamic retraining approaches for an airborne speech recognition system p 395 A86-28444
Selecting cockpit functions for speech I/O technology
p 395 A86-28446
A speech processing system for an air traffic control radar simulator p 351 A86-28447
Wickens' resource allocation model - Implications for the design of human-machine systems
p 395 A86-28453
Army 21 - Aviation --- strategic and tactical operational concept p 355 A86-28454
2010 - The symbionic cockpit p 355 A86-28455
Instructor station for the ILLIMAC general aviation instrument training simulator p 371 A86-28462
Pilot/Vehicle Interface Design System (PIVIDS)
p 361 A86-28512
The Crew Station Information Manager - An avionics expert system p 361 A86-28515
Evaluation of 16 measures of mental workload using a simulated flight task emphasizing mediational activity
p 395 A86-28864
Selection of a man-modelling CAD (Computer-Aided Design)
[AD-A161342] p 400 N86-22159

MANAGEMENT METHODS
Software management for integrated avionics systems
p 402 A86-28425
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

MANEUVERABILITY
Subsonic flow investigations on a cranked wing designed for high maneuverability
[NASA-CR-178046] p 340 N86-20361

MANUFACTURING
The 1-(diorganooxphosphonyl)methyl-2, 4- and -2, 6-dinitro and diamino benzenes and their derivatives
[NASA-CASE-ARC-11425-2] p 378 N86-20499

MAP MATCHING GUIDANCE
A distributed, fault-tolerant implementation of the airborne digital map using VLSI common programmable modules p 349 A86-28337
Design techniques for improved map-aided navigation
p 349 A86-28357

MAPPING
Colour design in aviation cartography
p 358 A86-28066
A constant altitude flight survey method for mapping atmospheric ambient pressures and systematic radar errors p 360 A86-28507

MARKERS
A methodology for applying bar code technology to Aircraft Maintenance Unit support sections
[AD-A161783] p 402 N86-22441

MARKING
Obstruction marking and lighting
[AC-70/7460-1G] p 371 N86-20410

MARKOV PROCESSES
Noise immunity of signals with minimum FSK
p 383 A86-27492

MARS SURFACE
Dirigible airships for Martian surface exploration
[AAS 84-176] p 372 A86-28802

MARTENSITIC STAINLESS STEELS
Properties and potential aerospace applications of E Z 3 CNDA 13-08 steel. II p 374 A86-26338

MASKING
A comparison of digital terrain models and terrain masking algorithms p 350 A86-28391

MATHEMATICAL MODELS
Modeling and simulation. Volume 15 - Proceedings of the Fifteenth Annual Pittsburgh Conference, University of Pittsburgh, PA, April 19, 20, 1984. Part 5 - General modeling and simulation p 397 A86-28280
Modular simulators - Is a local area network sufficient? --- for use in flight simulators p 371 A86-28460
A ring-vortex downburst model for flight simulations
p 393 A86-28568
Measurements of ocean wave spectra and modulation transfer function with the airborne two-frequency scatterometer p 393 A86-28618

Interpolation of heights and slopes from a digital terrain elevation model
[BAE-BT-13196] p 352 N86-20382

Vibrations and structureborne noise in space station
[NASA-CR-176520] p 372 N86-20485

A preliminary note on the development of a three dimensional potential code in Cartesian Coordinates
[NAL-TM-AE-8504] p 399 N86-21233

Application of PRA to HEMP vulnerability analysis
[DE86-001781] p 399 N86-21260

STEP and STEPSPL: Computer programs for aerodynamic model structure determination and parameter estimation
[NASA-TM-86410] p 370 N86-21549

**MATRICES (MATHEMATICS)**

Matrix equations of the spatial flight of an asymmetrical rigid body p 365 A86-27446

Design of direct digital flight-mode control systems for high-performance aircraft using step-response matrices p 367 A86-28387

Computation of transfer function matrices
[NAL-TM-SE-8509] p 399 N86-21232

**MEASURING INSTRUMENTS**

Ultrasonic liquid quantity measurement --- in oils p 360 A86-28478

**MECHANICAL ENGINEERING**

Mechanical design and evaluation of a slotted CFRP waveguide antenna p 383 A86-27703

**MECHANICAL PROPERTIES**

Properties and potential aerospace applications of E Z 3 CNDA 13-08 steel. II p 374 A86-26338

Effect of processing and heat treatment on the mechanical properties of Ti-6Al-2Sn-4Zr-6Mo alloy p 375 A86-27231

Properties of diffusion bonded butt joints in Ti-6Al-4V and Ti-4Al-4Mo-2Sn-0.5Si (IMI 550) alloys p 375 A86-27260

EB repair welding of a critical aircraftpart made from the nonweldable titanium alloy 3.7184.7 (Ti-Al4-Mo4-Sn2-Si) p 382 A86-27276

New aramid developments for aerospace/aircraft applications p 377 A86-27759

**MEMORY (COMPUTERS)**

Imaging connector interconnect system for a parallel fiber optic data bus p 385 A86-28340

**MENTAL PERFORMANCE**

Wickens' resource allocation model - Implications for the design of human-machine systems p 395 A86-28453

Evaluation of 16 measures of mental workload using a simulated flight task emphasizing mediational activity p 395 A86-28864

**METAL FATIGUE**

Fatigue properties of Ti-10V-2Fe-03Al p 375 A86-27274

The fretting fatigue behaviour of the titanium alloy Ti-6Al-4V p 376 A86-27370

Fretting fatigue testing with a fretting bridge equipment Stress analysis, amplitudes of slip, reliability p 383 A86-27371

The strain controlled fatigue behaviour of a near-alpha titanium alloy p 376 A86-27383

High temperature fatigue behavior of IMI 685 p 376 A86-27385

**METAL HYDRIDES**

Development in PM HHDH-Ti6Al4V technology for aircraft application --- High-quality Hydride Dehydriding Process p 375 A86-27224

**METAL MATRIX COMPOSITES**

Some recent research and development of composites in Japan p 377 A86-27765

**METAL PLATES**

Strength profile in Al-Li plate material p 374 A86-27198

**METAL SHEETS**

Producibility of aircraft structural parts by superplastic forming and diffusion bonding p 382 A86-27272

**METALS**

Conference on Steels and Special Alloys in Aeronautics, 11th, Le Bourget, France, June 6, 1985, Proceedings p 372 A86-26326

**METEOROLOGICAL FLIGHT**

Relative accuracy of ALPEX aircraft data: An evaluation of the ALPEX intercomparison flight with the NCAR (National Center for Atmospheric Research) Electra, the NOAA (National Oceanic and Atmospheric Administration P3 and the DFVLR (Deutsche Forschungs- und Versuchsanstait fuer Luft-und Raumfahrt) Falcon
[PB86-100823] p 394 N86-22067

**METEOROLOGICAL PARAMETERS**

Verification and application of the icing scaling equations
[AIAA PAPER 86-0481] p 343 A86-26640

Relative accuracy of ALPEX aircraft data: An evaluation of the ALPEX intercomparison flight with the NCAR (National Center for Atmospheric Research) Electra, the NOAA (National Oceanic and Atmospheric Administration P3 and the DFVLR (Deutsche Forschungs- und Versuchsanstait fuer Luft-und Raumfahrt) Falcon
[PB86-100823] p 394 N86-22067

**METEOROLOGICAL RADAR**

The Stapleton microburst advisory service project: An operational viewpoint
[AD-A161543] p 394 N86-21078

Weather radar studies
[AD-A161622] p 394 N86-22061

**METEOROLOGICAL RESEARCH AIRCRAFT**

Theoretical and experimental investigations of flow vector measurements with angle-of-attack and sideslip sensors on DFVLR meteorological research aircraft
[DFVLR-FB-85-50] p 358 N86-21541

The icing research aircraft DO28, D-IFMP of DFVLR, and its measuring equipment
[DFVLR-MITT-85-12] p 394 N86-22064

Relative accuracy of ALPEX aircraft data: An evaluation of the ALPEX intercomparison flight with the NCAR (National Center for Atmospheric Research) Electra, the NOAA (National Oceanic and Atmospheric Administration P3 and the DFVLR (Deutsche Forschungs- und Versuchsanstait fuer Luft-und Raumfahrt) Falcon
[PB86-100823] p 394 N86-22067

**METEOROLOGICAL SERVICES**

Forecasting for civil aviation. I p 393 A86-29002

**MICROCOMPUTERS**

The development of microcomputer codes for studying the flight dynamics and performance of helicopters p 366 A86-27660

The use of microcomputers in inertial navigation systems with strapdown sensors and for measurement systems of average accuracy --- German thesis p 347 A86-27649

**MICROPHONES**

Improving intelligibility in audio distribution systems p 395 A86-28513

An experimental appraisal of the use of ground-plane microphones for aircraft noise measurement --- certification tests
[NPL-AC-104] p 401 N86-22302

**MICROSTRUCTURE**

Fatigue-crack propagation through titanium welds p 375 A86-27264

High temperature fatigue behavior of IMI 685 p 376 A86-27385

**MICROWAVE COUPLING**

Aircraft coupling model evaluations at SHF/EHF p 346 A86-27128

**MICROWAVE IMAGERY**

Measurements of ocean wave spectra and modulation transfer function with the airborne two-frequency scatterometer p 393 A86-28618

**MICROWAVE LANDING SYSTEMS**

Microwave Landing System (MLS) p 346 A86-26444

Flight tests of MLS elevation guidance p 348 A86-27899

Microwave Landing System p 349 A86-28358

Performance of a commercial transport under typical MLS noise environment
[NASA-CR-178032] p 352 N86-20384

**MICROWAVE RESONANCE**

Measurements of ocean wave spectra and modulation transfer function with the airborne two-frequency scatterometer p 393 A86-28618

**MILITARY AIRCRAFT**

Aircraft coupling model evaluations at SHF/EHF p 346 A86-27128

Fiber optic high speed data bus p 385 A86-28338

High speed bus for Pave Pillar applications p 385 A86-28343

A dual channel high speed fiber optics multiplex data bus system p 386 A86-28344

A Modular Stress Management System (MSMS) with worldwide applications p 359 A86-28367

An adaptive UD-factorized Kalman filter for real-time tactical aircraft Track-While-Scan systems p 350 A86-28370

Autonomous landing guidance systems p 350 A86-28385

Auditory signals in military aircraft - Ergonomic principles versus practice p 395 A86-28442

Knowledge engineering for a flight management expert system p 368 A86-28498

Electronic display luminance and grey scale control --- for military aircraft p 360 A86-28505

Flying qualities design criteria for highly augmented systems p 369 A86-28509

**MILITARY AVIATION**

A comparison of digital terrain models and terrain masking algorithms p 350 A86-28391

**MILITARY OPERATIONS**

Army 21 - Aviation --- strategic and tactical operational concept p 355 A86-28454

Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**MILITARY TECHNOLOGY**

S-2 glass fiber - Its role in military applications p 377 A86-27702

NAECON 1985; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 20-24, 1985. Volumes 1 & 2 p 348 A86-28326

Robotic refueling system for tactical and strategic aircraft
[AD-D011980] p 358 N86-21540

**MILLIMETER WAVES**

Detection of non-moving targets by airborne mm-wave radars p 351 A86-29783

**MISSILES**

The parallel-plate and rhombic EMP simulators - A summarizing review p 381 A86-27146

**MODAL RESPONSE**

Linear and nonlinear modal analysis of aeroelastic structural systems p 387 A86-28742

**MODULARITY**

Modular simulators - A comprehensive unified architecture --- for flight training p 371 A86-28458

Modular simulators - How to make it work --- procurement and logistics for flight-weapon system trainer p 371 A86-28459

Modular simulators - Is a local area network sufficient? --- for use in flight simulators p 371 A86-28460

**MOISTURE CONTENT**

Diffusion of water in carbon epoxy composites p 377 A86-27754

**MOMENTUM THEORY**

A revision of the actuator disk concept and momentum theory --- rotary wing flow
[REPT-R-732-D] p 341 N86-20374

**MONITORS**

Remote aircraft maintenance monitoring using telemetry p 347 A86-27813

**MOTION SIMULATION**

Motion planning in the presence of moving obstacles
[AD-A161374] p 400 N86-22208

**MTBF**

Improved reliability of electronic circuits through the use of heat pipes p 386 A86-28479

**MULTIPLEXING**

Real-time telemetry of complete 1553 data buses p 347 A86-27789

**N**

**NACELLES**

Effect of underwing aft-mounted nacelles on the longitudinal aerodynamic characteristics of a high-wing transport airplane
[NASA-TP-2447] p 339 N86-20345

Installation effects of long-duct pylon-mounted nacelles on a twin-jet transport model with swept supercritical wing
[NASA-TP-2457] p 339 N86-20346

Integration effects of underwing forward- and rearward-mounted separate-flow, flow-through nacelles on a high-wing transport
[NASA-TM-87627] p 342 N86-21514

**NAP-OF-THE-EARTH NAVIGATION**

Design techniques for improved map-aided navigation p 349 A86-28357

**NAVIGATION AIDS**

Institute of Navigation, Annual Meeting, 41st, U.S. Naval Academy, Annapolis, MD, June 25-27, 1985, Proceedings p 346 A86-26501

Avner Electronic Magnetic Compass and low cost navigation system p 358 A86-26504

Commercial aviation GPS Navigation Set flight test results p 346 A86-26507

A new system simultaneously covering en route navigation and landing p 348 A86-27898

Design techniques for improved map-aided navigation p 349 A86-28357

Design considerations for Doppler VOR ground station antenna arrangement p 349 A86-28360

Expert System Pilot Aid p 361 A86-28516

Covariance specification for the linear time-invariant output-feedback control systems using a Kalman filter
[NAL-TR-882] p 399 N86-21219

**NAVIGATION INSTRUMENTS**

Decentralization filtering and redundancy management/failure detection for multisensor integrated navigation systems p 346 A86-26443

Reliability of aircraft navigation p 348 A86-28312

Navigation methodology - An investigation of an inertial navigation system (INS) enhancement p 349 A86-28356

Concept and performance analysis of a strapdown northfinder p 349 A86-28361

LANTIRN flight test - Opening the night window --- Low Altitude Navigation and Targeting Infrared System for Night p 361 A86-28842

**NAVSTAR SATELLITES**

Civil helicopter flight operations using differential GPS p 346 A86-26509

**NIGHT FLIGHTS (AIRCRAFT)**

LANTIRN flight test - Opening the night window --- Low Altitude Navigation and Targeting Infrared System for Night p 361 A86-28842

**NOISE INTENSITY**

Airport-Noise Levels and Annoyance Model (ALAMO) user's guide [NASA-TM-87695] p 401 N86-22304

Airport-Noise Levels and Annoyance Model (ALAMO) system's reference manual [NASA-TM-87694] p 401 N86-22305

An evaluation of study design for estimating a time-of-day noise weighting [NASA-CR-178062] p 401 N86-22306

**NOISE MEASUREMENT**

An experimental appraisal of the use of ground-plane microphones for aircraft noise measurement --- certification tests [NPL-AC-104] p 401 N86-22302

Measurement of noise from airplanes traveling at heights 3500 to 6000m [FFA-TI-AU-2168] p 401 N86-22312

**NOISE PREDICTION**

Application of the finite element method in the calculation of transmission loss of flat and curved panels --- for noise reduction in aircraft p 400 A86-26888

Vibrations and structureborne noise in space station [NASA-CR-176520] p 372 N86-20485

**NOISE PREDICTION (AIRCRAFT)**

Noise levels for US certificated and foreign aircraft [FAA-AC-36-1D] p 401 N86-21279

**NOISE PROPAGATION**

Vibrations and structureborne noise in space station [NASA-CR-176520] p 372 N86-20485

**NOISE REDUCTION**

Application of the finite element method in the calculation of transmission loss of flat and curved panels --- for noise reduction in aircraft p 400 A86-26888

Noise levels for US certificated and foreign aircraft [FAA-AC-36-1D] p 401 N86-21279

Recent experiences in the analysis of aircraft cabin noise p 401 N86-21287

Beam dampers for skin vibration and noise reduction in the 747 p 389 N86-21917

**NOISE SPECTRA**

Improving intelligibility in audio distribution systems p 395 A86-28513

**NOISE TOLERANCE**

An evaluation of study design for estimating a time-of-day noise weighting [NASA-CR-178062] p 401 N86-22306

**NONDESTRUCTIVE TESTS**

Reliable nondestructive testing - The key to using weldments in critical fighter aircraft structure p 380 A86-26544

**NONEQUILIBRIUM FLOW**

Numerical analysis of nonequilibrium flow about airfoil in thin shock layer approximation p 343 N86-22258

**NONLINEAR EQUATIONS**

Nonlinear analysis of pressure oscillations in ramjet engines [AIAA PAPER 86-0001] p 366 A86-26601

**NONLINEAR FILTERS**

Noise immunity of signals with minimum FSK p 383 A86-27492

Optimum maintenance of aircraft systems on the basis of their condition with allowance for measurement errors p 354 A86-28310

**NONLINEAR SYSTEMS**

Limiting performance of nonlinear systems with applications to helicopter vibration control [AD-A161457] p 370 N86-21551

**NOSE CONES**

Research on the aerodynamic characteristics of vehicles by free flight testing at supersonic speeds [NAL-TR-876] p 339 N86-20353

Side force characteristics of a 20 deg cone at high angles of attack [NAL-TM-AE-8503] p 340 N86-20356

**NOZZLE THRUST COEFFICIENTS**

Propulsion and control propellers with thruster nozzles primarily for aircraft applications [NASA-TM-77715] p 342 N86-21511

**NUCLEAR EXPLOSIONS**

The parallel-plate and rhombic EMP simulators - A summarizing review p 381 A86-27146

Operation REDWING, Project 5.2, in-flight participation of a B-52 [AD-A995286] p 357 N86-21536

**NUCLEAR MAGNETIC RESONANCE**

Development of LC-13C NMR [NASA-CR-176656] p 379 N86-21704

**NUCLEAR RESEARCH**

Japan report: Science and technology [JPRS-JST-86-001] p 369 N86-21723

**NUMERICAL CONTROL**

CAD/CAM supports flight test modifications p 356 A86-29823

Covariance specification for the linear time-invariant output-feedback control systems using a Kalman filter [NAL-TR-882] p 399 N86-21219

**NUMERICAL INTEGRATION**

State estimation errors in digital Kalman filters caused by measurement delays and numerical integration p 397 A86-28368

## O

**OBSTACLE AVOIDANCE**

Demonstration of an innovative technique for Terrain Following/Terrain Avoidance - The Dynapath Algorithm p 350 A86-28389

Implementation of TF/TA in the digital terrain management and display system p 350 A86-28390

**OCEAN BOTTOM**

Characterization of shallow ocean sediments using the airborne electromagnetic method p 393 A86-28065

**OCEAN SURFACE**

Measurements of ocean wave spectra and modulation transfer function with the airborne two-frequency scatterometer p 393 A86-28618

**OCEANOGRAPHY**

Characterization of shallow ocean sediments using the airborne electromagnetic method p 393 A86-28065

**OMEGA NAVIGATION SYSTEM**

Omega - Commercial experiences with a mature system p 345 A86-26442

**ONBOARD DATA PROCESSING**

Onboard simulation - A demonstrated technology breakthrough for cost effective testing and training p 360 A86-28464

Design considerations for on-board simulation p 360 A86-28465

The development status of JTIDS dual mode TDMA and distributed TDMA (DTDMA) full scale development terminals - An update p 351 A86-28473

**ONBOARD EQUIPMENT**

Controlled impact demonstration on-board (interior) photographic system p 392 N86-21946

**OPERATING COSTS**

Jet engine operating and support cost estimating relationship development [AD-A161683] p 364 N86-21547

**OPTICAL COMMUNICATION**

The effects of atmospheric turbulence on an air-to-air optical communication link p 351 A86-28470

**OPTIMAL CONTROL**

Numerical fixed-point solution for near-optimum regulators of linear quadratic Gaussian control problems for singularly perturbed systems p 396 A86-26577

**OPTIMIZATION**

Application of modern structural optimization to vibration reduction in rotorcraft p 352 A86-26587

Efficient identification of critical stresses in structures subject to dynamic loads p 380 A86-26682

Optimal design of composite power transmission shafting p 353 A86-27654

Numerical optimization design of advanced transonic wing configurations p 356 A86-28562

Optimal airframe synthesis for gust loads [NASA-CR-178047] p 357 N86-20386

**ORGANIC COMPOUNDS**

The 1-(diorganooxphosphonyl)methyl-2, 4- and -2, 6-dinitro and diamino benzenes and their derivatives [NASA-CASE-ARC-11425-2] p 378 N86-20499

Conductive heterocyclic ladder polymers [AD-D011915] p 378 N86-20569

**ORIFICES**

The application to airfoils of a technique for reducing orifice-induced pressure error at high Reynolds numbers [NASA-TP-2537] p 339 N86-20351

**OUTPUT**

Covariance specification for the linear time-invariant output-feedback control systems using a Kalman filter [NAL-TR-882] p 399 N86-21219

## P

**PANEL METHOD (FLUID DYNAMICS)**

An attached flow design of a noninterfering leading-edge extension to a thick delta wing p 337 A86-28569

Parametric Bi-cubic surface patch for computer aided geometric design of aircraft and/or other three-dimensional geometries [NAL-TM-AE-8505] p 399 N86-21168

**PANELS**

Application of the finite element method in the calculation of transmission loss of flat and curved panels --- for noise reduction in aircraft p 400 A86-26888

Measurements of the response of transport aircraft ceiling panels to fuel fires p 343 A86-28564

Aircraft interior panel test criteria derived from full-scale fire tests [AD-A161637] p 345 N86-21529

**PARALLEL PLATES**

The parallel-plate and rhombic EMP simulators - A summarizing review p 381 A86-27146

**PARAMETER IDENTIFICATION**

Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics p 353 A86-27661

Application of PRA to HEMP vulnerability analysis [DE86-001781] p 399 N86-21260

STEP and STEPSPL: Computer programs for aerodynamic model structure determination and parameter estimation [NASA-TM-86410] p 370 N86-21549

**PARTICLE TRAJECTORIES**

Particle trajectory computation on a 3-dimensional engine inlet [NASA-CR-175023] p 344 N86-20379

**PASSENGER AIRCRAFT**

The golden age of the great passenger airships: Graf Zeppelin and Hindenburg --- Book p 403 A86-27648

Flight Test Instrumentation System FTIS for type-certification of the Indonesian aircraft CN 235 p 358 A86-27818

ATRA42 - First of a family p 353 A86-28060

**PASSENGERS**

Proceedings of Cabin Safety Conference and Workshop held on 11-14 December 1984 [AD-A160950] p 344 N86-21527

**PAVEMENTS**

Evaluation of the FAA design procedures for high traffic volume pavements [DOT/FAA/PM-84/14] p 352 N86-20383

Runway rubber removal specification development [DOT/FAA/PN-85/33] p 372 N86-21556

**PCM TELEMETRY**

Real-time telemetry of complete 1553 data buses p 347 A86-27789

**PERCEPTION**

Avionics standardization: Perceptions and recommendations [AD-A161709] p 361 N86-20388

**PERFORMANCE PREDICTION**

Numerical simulation of a controlled-flow tunnel for V/STOL testing p 371 A86-28561

**PERFORMANCE TESTS**

Data systems for logistics evaluation during operational test p 398 A86-28483

STALINS method for takeoff and landing trajectory measurements p 358 A86-28566

Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS system [DE85-017614] p 341 N86-20371

Programmable, automated transistor test system [NASA-TP-2554] p 389 N86-21755

**PERTURBATION**

A contribution to the digital compensation of periodic disturbances with frequencies in bounded intervals --- in helicopters [DFVLR-FB-85-55] p 370 N86-21553

**PERTURBATION THEORY**

Numerical fixed-point solution for near-optimum regulators of linear quadratic Gaussian control problems for singularly perturbed systems p 396 A86-26577

**PHOSPHORUS COMPOUNDS**

The 1-(diorganooxphosphonyl)methyl-2, 4- and -2, 6-dinitro and diamino benzenes and their derivatives [NASA-CASE-ARC-11425-2] p 378 N86-20499

**PHYSIOLOGICAL EFFECTS**

2010 - The symbionic cockpit p 355 A86-28455

**PIEZOELECTRIC TRANSDUCERS**

Piezoelectric deicing device [NASA-CASE-LEW-13773-2] p 388 N86-20671

**PILOT INDUCED OSCILLATION**

Quantitative feedback design approach to pilot-in-the-loop analysis p 366 A86-28377

**PILOT PERFORMANCE**
Discrete maneuver flying qualities considerations in control system design p 366 A86-28378
Pilot/Vehicle Interface Design System (PIVIDS) p 361 A86-28512
Expert System Pilot Aid p 361 A86-28516
Head-up/head-down transition - Measurement of transition times p 396 A86-29092

**PILOT TRAINING**
Low cost part task trainer for the GBU-15 guided bomb p 370 A86-28457
Onboard simulation - A demonstrated technology breakthrough for cost effective testing and training p 360 A86-28464
Design considerations for on-board simulation p 360 A86-28465

**PILOTS (PERSONNEL)**
General aviation pilot and aircraft activity survey [AD-A161665] p 345 N86-21530

**PITCHING MOMENTS**
Direct derivative measurements in the presence of sting plunging p 371 A86-28560

**PITOT TUBES**
Wind tunnel calibration of a flow direction sensor and a pilot-static tube to high angles of attack and sideslip p 359 A86-28364

**PLANNING**
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987 [AD-A162792] p 402 N86-22443

**PLASTIC AIRCRAFT STRUCTURES**
Diffusion of water in carbon epoxy composites p 377 A86-27754

**PLATE THEORY**
Reliability of the plates and shells of aircraft p 384 A86-28314

**PLATES (STRUCTURAL MEMBERS)**
A study of the static post buckling behavior of composite sandwich plates p 383 A86-27653
Equivalent plate analysis of aircraft wing box structures with general planform geometry [NASA-TM-87697] p 392 N86-21954

**PLOTTING**
Data reduction, management, and analysis software for CID p 399 N86-21938

**PLUMES**
Jet plume temperature effects on afterbody pressure distribution and drag [NAL-TM-FM-8502] p 340 N86-20354

**PNEUMATIC EQUIPMENT**
Method for improving the fuel efficiency of a gas turbine engine [NASA-CASE-LEW-13142-2] p 364 N86-20389

Life prediction for aromatic polyamide reinforcements p 377 A86-27691

**POLYIMIDES**
Aerospace applications of PMR polyimide composites p 377 A86-27730

**POLYMER CHEMISTRY**
The 1-(diorganooxphosphonyl)methyl-2, 4- and -2, 6-dinitro and diamino benzenes and their derivatives [NASA-CASE-ARC-11425-2] p 378 N86-20499

**POLYMER MATRIX COMPOSITES**
Aerospace applications of PMR polyimide composites p 377 A86-27730
Copolymers of vinyl styrylpyridines or vinyl stilbazoles with bismaleimide [NASA-CASE-ARC-11429-1-CU] p 378 N86-20560

**POLYMERIZATION**
Conductive heterocyclic ladder polymers [AD-D011915] p 378 N86-20569

**POLYURETHANE FOAM**
Segmented tubular cushion springs and spring assembly [NASA-CASE-ARC-11349-1] p 388 N86-20797

**POSITION (LOCATION)**
United States Navy - Canadian forces solid state flight data recorder/crash position locator experiment on the B-720 controlled impact demonstration p 391 N86-21945
Motion planning in the presence of moving obstacles [AD-A161374] p 400 N86-22208

**POSITION ERRORS**
Commercial aviation GPS Navigation Set flight test results p 346 A86-26507
Errare humanum est . . . sed perseverare diabolicum or navigation errors of the 747 and the 'heading' position p 348 A86-27900

**POSITIONING**
A survey of commercially available positioning systems p 345 A86-26440

**POSTFLIGHT ANALYSIS**
JTIDS RELNAV performance evaluation --- Joint Tactical Information Distribution System in relative air navigation p 350 A86-28369

**POTENTIAL FLOW**
Numerical analysis of invisicid flows about wing-fuselage combinations. 2: Development of full potential flow code YOKUDO-P [NAL-TR-881] p 341 N86-20364
Computation of three dimensional potential flow around a finite wing with a leading-edge discontinuity at high angle of attack p 341 N86-21504
Two methods for viscous and inviscid free-wake analysis of helicopter rotors [AD-A161513] p 342 N86-21521

**POWDER METALLURGY**
Development in PM HHDH-Ti6Al4V technology for aircraft application --- High-quality Hydride Dehydriding Process p 375 A86-27224

**PREDICTION ANALYSIS TECHNIQUES**
Modular application of a shock/boundary layer interaction solution to supercritical viscous-inviscid flow field analysis p 338 N86-20343
An evaluation of study design for estimating a time-of-day noise weighting [NASA-CR-178062] p 401 N86-22306

**PRESSURE DISTRIBUTION**
Numerical optimization design of advanced transonic wing configurations p 356 A86-28562
Jet plume temperature effects on afterbody pressure distribution and drag [NAL-TM-FM-8502] p 340 N86-20354

**PRESSURE DRAG**
Jet plume temperature effects on afterbody pressure distribution and drag [NAL-TM-FM-8502] p 340 N86-20354

**PRESSURE MEASUREMENT**
Cryogenic tunnel measurement of total temperature and pressure p 387 A86-28570
Flight measurements of surface pressures on a flexible supercritical research wing [NASA-TP-2501] p 339 N86-20350

**PRESSURE OSCILLATIONS**
Nonlinear analysis of pressure oscillations in ramjet engines [AIAA PAPER 86-0001] p 363 A86-26601

**PRESSURE SENSORS**
High stability pressure transducers for air data systems and test sets p 359 A86-28362
A novel primary air data quality pressure transducer p 359 A86-28363
Wind shear measurement on board a Morane 893 p 394 N86-21084

**PREVENTION**
Reliability and failure prevention through ESA in the 80's And beyond p 381 A86-26937

**PROBABILITY THEORY**
Reliability of aircraft navigation p 348 A86-28312
Application of PRA to HEMP vulnerability analysis [DE86-001781] p 399 N86-21260

**PROCUREMENT MANAGEMENT**
Modular simulators - How to make it work --- procurement and logistics for flight-weapon system trainer p 371 A86-28459

**PRODUCT DEVELOPMENT**
Software management for integrated avionics systems p 402 A86-28425

**PRODUCTION MANAGEMENT**
Production-theoretical study of air traffic output production --- German thesis p 402 A86-27834

**PRODUCTIVITY**
Production-theoretical study of air traffic output production --- German thesis p 402 A86-27834

**PROGRAM VERIFICATION (COMPUTERS)**
IV&V for the automatic test control system in the USAF Aeropropulsion Systems Test Facility p 398 A86-28430

**PROP-FAN TECHNOLOGY**
Will 1990s aircraft be powered by propfan or advanced turbofan? p 363 A86-26370
Propfan engine designs examined p 363 A86-26371

**PROPELLER BLADES**
Vortex conception of rotor and mutual effect of screw/propellers [NASA-TM-77979] p 342 N86-21510

**PROPELLER FANS**
Method for the prediction of the installation aerodynamics of a propfan at subsonic speeds: User manual [NASA-CR-178057] p 340 N86-20360

**PROPELLERS**
Propfan engine designs examined p 363 A86-26371
Propulsion and control propellers with thruster nozzles primarily for aircraft applications [NASA-TM-77715] p 342 N86-21511
Measurement of noise from airplanes traveling at heights 3500 to 6000m [FFA-TI-AU-2168] p 401 N86-22312

**PROPULSION SYSTEM CONFIGURATIONS**
Propulsion and control propellers with thruster nozzles primarily for aircraft applications [NASA-TM-77715] p 342 N86-21511
Comparison of airborne data acquisition systems at ARL (Aeronautical Research Laboratories) [AD-A161664] p 357 N86-21537

**PROTOCOL (COMPUTERS)**
Real-time telemetry of complete 1553 data buses p 347 A86-27789

**PSYCHOLOGICAL EFFECTS**
2010 - The symbionic cockpit p 355 A86-28455

**PULSE COMMUNICATION**
Noise immunity of signals with minimum FSK p 383 A86-27492

**PULSE GENERATORS**
CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949

**PULSES**
Digital filtering and acceleration pulse interpretation p 400 N86-21941

**PYLONS**
Integration effects of underwing forward- and rearward-mounted separate-flow, flow-through nacelles on a high-wing transport [NASA-TM-87627] p 342 N86-21514

**PYRIDINES**
Copolymers of vinyl styrylpyridines or vinyl stilbazoles with bismaleimide [NASA-CASE-ARC-11429-1-CU] p 378 N86-20560

## Q

**QUADRATIC EQUATIONS**
Numerical fixed-point solution for near-optimum regulators of linear quadratic Gaussian control problems for singularly perturbed systems p 396 A86-26577

**QUALIFICATIONS**
General aviation pilot and aircraft activity survey [AD-A161665] p 345 N86-21530

## R

**RADAR DETECTION**
A flexible programmable signal processor for next generation fighter aircraft p 385 A86-28330

**RADAR TARGETS**
Detection of non-moving targets by airborne mm-wave radars p 351 A86-29783

**RADAR TRACKING**
An adaptive UD-factorized Kalman filter for real-time tactical aircraft Track-While-Scan systems p 350 A86-28370
A constant altitude flight survey method for mapping atmospheric ambient pressures and systematic radar errors p 360 A86-26507

**RADIANT HEATING**
High frequency-heated air turbojet [NASA-TM-77710] p 364 N86-21543

**RADIATION PROTECTION**
Unified EM transient protection requirements for aircraft avionics line replaceable units p 355 A86-28485

**RADIO ANTENNAS**
Design considerations for Doppler VOR ground station antenna arrangement p 349 A86-28360

**RADIO BEACONS**
United States Navy - Canadian forces solid state flight data recorder/crash position locator experiment on the B-720 controlled impact demonstration p 391 N86-21945

**RADIO DIRECTION FINDERS**
United States Navy - Canadian forces solid state flight data recorder/crash position locator experiment on the B-720 controlled impact demonstration p 391 N86-21945

**RADIO NAVIGATION**
Radionavigation planning in the FAA p 402 A86-26427
A survey of commercially available positioning systems p 345 A86-26440
Omega - Commercial experiences with a mature system p 345 A86-26442

**RADIO RECEIVERS**
Noise immunity of signals with minimum FSK p 383 A86-27492

**RADIOGRAPHY**
Reliable nondestructive testing - The key to using weldments in critical fighter aircraft structure p 380 A86-26544

**RAMJET ENGINES**
Nonlinear analysis of pressure oscillations in ramjet engines [AIAA PAPER 86-0001] p 363 A86-26601

**RANDOM VIBRATION**

Dynamic stability of elastic structures under random influences p 384 A86-28318

The life of reinforced thin-walled structures in a random force field p 384 A86-28319

**READERS**

A methodology for applying bar code technology to Aircraft Maintenance Unit support sections [AD-A151783] p 402 N86-22441

**REAL TIME OPERATION**

Real-time telemetry of complete 1553 data buses p 347 A86-27789

Data-driven operating concepts for real-time simulation systems p 397 A86-28348

Real time optimal flight path generation by storage of massive data bases p 397 A86-28388

Expert systems for real time applications p 398 A86-28486

Real-time circle generation for raster displays --- computer graphics for aircraft displays p 361 A86-28511

A ring-vortex downburst model for flight simulations p 393 A86-28568

**RECREATION**

Vertically operating flight vehicle for drilling and agricultural use [NASA-TM-77713] p 357 N86-21535

**RECYCLING**

Requirements for recycling of valuable chips from and for aircraft manufacturing p 374 A86-27209

Recycling of titanium scrap for the production of high-duty aerospace components p 382 A86-27211

**REDUNDANCY**

Decentralization filtering and redundancy management/failure detection for multisensor integrated navigation systems p 346 A86-26443

**REFRACTORY MATERIALS**

Dual material exhaust nozzle flap [AD-D011998] p 364 N86-21548

**REFUELING**

Robotic refueling system for tactical and strategic aircraft [AD-D011980] p 358 N86-21540

**REGRESSION ANALYSIS**

STEP and STEPSPL: Computer programs for aerodynamic model structure determination and parameter estimation [NASA-TM-86410] p 370 N86-21549

**REGULATIONS**

Ultralight aircraft - A need for better regulation than 14 C.F.R. Section 103 --- in air law p 343 A86-28000

**REGULATORS**

Numerical fixed-point solution for near-optimum regulators of linear quadratic Gaussian control problems for singularly perturbed systems p 396 A86-26577

**REINFORCED PLASTICS**

Some recent research and development of composites in Japan p 377 A86-27765

**REINFORCED SHELLS**

The life of reinforced thin-walled structures in a random force field p 384 A86-28319

**REINFORCING FIBERS**

Life prediction for aromatic polyamide reinforcements p 377 A86-27691

**RELIABILITY**

Design validation of fly-by-wire flight control systems p 362 N86-20409

**RELIABILITY ANALYSIS**

Reliability and failure prevention through ESA in the 80's And beyond p 381 A86-26937

Application of fuzzy logic to the estimation of software reliability for computer systems p 396 A86-27472

Reliability and maintenance of aircraft p 384 A86-28309

Reliability of aircraft navigation p 348 A86-28312

Reliability of the plates and shells of aircraft p 384 A86-28314

Problems in the dynamics of aircraft structures exposed to intensive acoustic loading p 384 A86-28316

A unified method for evaluating the strength and reliability of the blades of the axial-flow compressors and gas turbines of aircraft engines p 364 A86-28317

The effect of changes in the static strength of a structure during service on the reliability of aircraft p 384 A86-28322

**RELIABILITY ENGINEERING**

Problems of aircraft reliability p 383 A86-28303

Control of the flight testing of aircraft as a means of increasing their reliability p 397 A86-28307

**REMOTE CONTROL**

Robotic refueling system for tactical and strategic aircraft [AD-D011980] p 358 N86-21540

**REMOTE MANIPULATOR SYSTEM**

Direct model reference adaptive control of a flexible robotic manipulator [NASA-CR-176659] p 396 N86-22113

**REMOTE SENSING**

Characterization of shallow ocean sediments using the airborne electromagnetic method p 393 A86-28065

**REMOTELY PILOTED VEHICLES**

Solar powered vehicle may fly year-long missions p 356 A86-29824

Full-Scale Transport controlled Impact Demonstration [NASA-CP-2395] p 390 N86-21933

**REMOVAL**

Rubber removal specification development [FAA/PM-85/33] p 371 N86-21555

**REPLACING**

Development of a computerised method of determining aircraft maintenance intervals [AD-A161339] p 336 N86-21500

**REPORTS**

Activities report of the aerospace industry in West Germany [ISSN-0176-5086] p 403 N86-22450

**RESEARCH**

Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987 [AD-A162792] p 402 N86-22443

**RESEARCH AIRCRAFT**

Procedure for utilizing the lift and thrust forces of ornithopters [NASA-TM-77682] p 357 N86-21534

**RESEARCH AND DEVELOPMENT**

International Conference on Rotorcraft Basic Research, Research Triangle Park, NC, February 19-21, 1985, Proceedings p 335 A86-27651

Some recent research and development of composites in Japan p 377 A86-27765

**RESIDUAL STRENGTH**

Strength of graphite/epoxy bolted wing-skin splice specimens subjected to outdoor exposure under constant load and yearly fatigue loading [NASA-TP-2542] p 378 N86-20508

**RESIN MATRIX COMPOSITES**

Copolymers of vinyl styrylpyridines or vinyl stilbazoles with bismaleimide [NASA-CASE-ARC-11429-1-CU] p 378 N86-20560

**RESONANCE TESTING**

Structural dynamic aspects of rotor antiresonant isolation p 353 A86-27663

**RESONANT VIBRATION**

Laminated damped fuselage structures p 389 N86-21916

**RESOURCE ALLOCATION**

Wickens' resource allocation model - Implications for the design of human-machine systems p 395 A86-28453

**RETRAINING**

Dynamic retraining approaches for an airborne speech recognition system p 395 A86-28444

**RIBBON PARACHUTES**

Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS system [DE85-017614] p 341 N86-20371

**RIGID ROTORS**

Dynamic stability of hingeless and bearingless rotors in forward flight p 366 A86-27662

**RISK**

Application of PRA to HEMP vulnerability analysis [DE86-001781] p 399 N86-21260

Steady and unsteady transonic pressure distributions on NACA 0012 p 337 A86-28565

**SERVICE LIFE**
The life of reinforced thin-walled structures in a random force field p 384 A86-28319

**SERVOMECHANISMS**
Digital fault tolerant flight actuation systems p 354 A86-28400

**SH-3 HELICOPTER**
Helicopter flight test demonstration of differential GPS p 345 A86-26438
Flight testing of an ASW helicopter p 352 A86-26535

**SHAFTS (MACHINE ELEMENTS)**
Optimal design of composite power transmission shafting p 353 A86-27654

**SHALLOW WATER**
Characterization of shallow ocean sediments using the airborne electromagnetic method p 393 A86-28065

**SHELL STABILITY**
Reliability of the plates and shells of aircraft p 384 A86-28314

**SHIPS**
Realtime piloted simulation investigation of helicopter flying qualities during approach and landing on nonaviation ships
[AIAA PAPER 86-0490] p 365 A86-26642

**SHOCK ABSORBERS**
Effect of underwing aft-mounted nacelles on the longitudinal aerodynamic characteristics of a high-wing transport airplane
[NASA-TP-2447] p 339 N86-20345
NASA experiments on the B-720 structure and seats p 390 N86-21936
NASA seat experiment and occupant responses p 390 N86-21939

**SHOCK LAYERS**
Modular application of a shock/boundary layer interaction solution to supercritical viscous-inviscid flow field analysis p 338 N86-20343
Numerical analysis of nonequilibrium flow about airfoil in thin shock layer approximation p 343 N86-22258

**SHORT TAKEOFF AIRCRAFT**
An integrated flight control system for a STOL transport aircraft p 367 A86-28384
Flying qualities design criteria for highly augmented systems p 369 A86-28509

**SIDESLIP**
Wind tunnel calibration of a flow direction sensor and a pitot-static tube to high angles of attack and sideslip p 359 A86-28364
Side force characteristics of a 20 deg cone at high angles of attack
[NAL-TM-AE-8503] p 340 N86-20356
Theoretical and experimental investigations of flow vector measurements with angle-of-attack and sideslip sensors on DFVLR meteorological research aircraft
[DFVLR-FB-85-50] p 358 N86-21541
STEP and STEPSPL: Computer programs for aerodynamic model structure determination and parameter estimation
[NASA-TM-86410] p 370 N86-21549

**SIGNAL FADING**
The effects of atmospheric turbulence on an air-to-air optical communication link p 351 A86-28470

**SIGNAL PROCESSING**
A combined optimal algorithm for filtering and calculating navigation coordinates p 348 A86-28311
A flexible programmable signal processor for next generation fighter aircraft p 385 A86-28330
Digital filtering and acceleration pulse interpretation p 400 N86-21941
CID-720 aircraft high-environment flight instrumentation system p 392 N86-21947

**SIMULATORS**
The parallel-plate and rhombic EMP simulators - A summarizing review p 381 A86-27146

**SINE WAVES**
Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics p 353 A86-27661

**SINGLE CRYSTALS**
The evolution of turbine blade materials p 373 A86-26330

**SKIN (STRUCTURAL MEMBER)**
Strength of graphite/epoxy bolted wing-skin splice specimens subjected to outdoor exposure under constant load and yearly fatigue loading
[NASA-TP-2542] p 375 N86-20508
Laminated damped fuselage structures p 389 N86-21916
Use of skin damping treatments to control airframe dynamic response for interior noise control p 389 N86-21919

**SKIN FRICTION**
Integration effects of underwing forward- and rearward-mounted separate-flow, flow-through nacelles on a high-wing transport
[NASA-TM-87627] p 342 N86-21514

**SLIPSTREAMS**
Method for the prediction of the installation aerodynamics of a propfan at subsonic speeds: User manual
[NASA-CR-178057] p 340 N86-20360

**SLOT ANTENNAS**
Mechanical design and evaluation of a slotted CFRP waveguide antenna p 383 A86-27703

**SOFTWARE ENGINEERING**
A new approach to ensuring deterministic processing in an integrated avionics software system p 398 A86-28419
Designing into the unknown --- military aircraft software p 398 A86-28420
Software management for integrated avionics systems p 402 A86-28425
Fault Tolerant Hardware/Software Architecture for Flight Critical Function
[AGARD-LS-143] p 369 N86-20399
Programmable, automated transistor test system
[NASA-TP-2554] p 389 N86-21755

**SOFTWARE TOOLS**
Aeroelastic tailoring study in aircraft design p 383 A86-27741
JTIDS RELNAV performance evaluation --- Joint Tactical Information Distribution System in relative air navigation p 350 A86-28369
IV&V for the automatic test control system in the USAF Aeropropulsion Systems Test Facility p 398 A86-28430

**SOLAR POWERED AIRCRAFT**
Solar powered vehicle may fly year-long missions p 356 A86-29824

**SOLAR SENSORS**
Airborne tracking Sun photometer apparatus and system
[NASA-CASE-ARC-11622-1] p 394 N86-21982

**SOLID STATE DEVICES**
Aircraft electrical power systems p 364 A86-28508
United States Navy - Canadian forces solid state flight data recorder/crash position locator experiment on the B-720 controlled impact demonstration p 391 N86-21945

**SOLID-SOLID INTERFACES**
Contact heat transfer - The last decade p 387 A86-28551

**SOOT**
Fuel property effects on combustion
[AD-A162451] p 378 N86-20522

**SPACE CAPSULES**
Research on the aerodynamic characteristics of vehicles by free flight testing at supersonic speeds
[NAL-TR-876] p 339 N86-20353

**SPACE EXPLORATION**
Dirigible airships for Martian surface exploration
[AAS 84-176] p 372 A86-28602

**SPACE FLIGHT**
Matrix equations of the spatial flight of an asymmetrical rigid body p 365 A86-27446

**SPACE MISSIONS**
Solar powered vehicle may fly year-long missions p 356 A86-29824

**SPACE NAVIGATION**
Institute of Navigation, Annual Meeting, 41st, U.S. Naval Academy, Annapolis, MD, June 25-27, 1985, Proceedings p 346 A86-26501

**SPACE STATIONS**
Vibrations and structureborne noise in space station
[NASA-CR-176520] p 372 N86-20485
Direct model reference adaptive control of a flexible robotic manipulator
[NASA-CR-176659] p 396 N86-22113

**SPACECRAFT CONSTRUCTION MATERIALS**
New developments in the materials used in airliner, helicopter and spacecraft structures p 372 A86-26327

**SPACECRAFT STRUCTURES**
New developments in the materials used in airliner, helicopter and spacecraft structures p 372 A86-26327
Aerospace applications of PMR polyimide composites p 377 A86-27730

**SPANWISE BLOWING**
Analysis of aerodynamic coefficients using gradient data: Spanwise turbulence effects on airplane response
[NASA-CR-3961] p 393 N86-21069

**SPARE PARTS**
Development of a computerised method of determining aircraft maintenance intervals
[AD-A161339] p 336 N86-21500

**SPECIFICATIONS**
F100 fuel sampling analysis
[AD-A161667] p 379 N86-21707

**SPEECH RECOGNITION**
A speech recognition research tool for the C-130 Hercules p 350 A86-28443
Dynamic retraining approaches for an airborne speech recognition system p 395 A86-28444

**SPLINE FUNCTIONS**
Efficient identification of critical stresses in structures subject to dynamic loads p 380 A86-26682

**SPOILERS**
A survivable fly-by-wire spoiler actuation system featuring nonflammable fluid, 8,000 PSI hydraulics and direct drive valves p 355 A86-28402
Aerodynamic characteristics of several current helicopter tail boom cross sections including the effect of spoilers
[NASA-TP-2506] p 339 N86-20349

**SPONTANEOUS COMBUSTION**
Aircraft accident report: Air Canada Flight 797, McDonnell Douglas DC-9-32, C-FTLU Greater Cincinnati International Airport, Covington, Kentucky, June 2, 1983
[PB86-910402] p 344 N86-21525

**SPRINGS (ELASTIC)**
Segmented tubular cushion springs and spring assembly
[NASA-CASE-ARC-11349-1] p 388 N86-20797

**STABILITY AUGMENTATION**
A programme of research into the aerodynamics, stability and control characteristics of a combat aircraft having a forward swept wing p 357 N86-21533

**STABILITY DERIVATIVES**
Low-speed stability characteristics of a helicopter with a sling load p 365 A86-26586
Direct derivative measurements in the presence of sting plunging p 371 A86-28560

Analysis of aerodynamic coefficients using gradient data: Spanwise turbulence effects on airplane response
[NASA-CR-3961] p 393 N86-21069

**STAGNATION PRESSURE**
Cryogenic tunnel measurement of total temperature and pressure p 387 A86-28570

**STAGNATION TEMPERATURE**
Cryogenic tunnel measurement of total temperature and pressure p 387 A86-28570

**STAINLESS STEELS**
The development of high strength stainless steels for the aeronautical industry p 373 A86-26337

**STANDARDIZATION**
Avionics standardization: Perceptions and recommendations
[AD-A161709] p 361 N86-20388

**STANDARDS**
Obstruction marking and lighting
[AC-70/7460-1G] p 371 N86-20410
Publications of the National Bureau of Standards, 1984 catalog
[PB85-245678] p 402 N86-21435
Minimum operational performance standards for airborne Distance Measuring Equipment (DME) operation within the radio frequency range of 960-1215 megahertz
[RTCA/DO-189] p 362 N86-21542

**STATE ESTIMATION**
State estimation errors in digital Kalman filters caused by measurement delays and numerical integration
p 397 A86-28368

**STATIC LOADS**
Strength analysis of flight vehicles --- Russian book
p 356 A86-29842

**STATIC PRESSURE**
The application to airfoils of a technique for reducing orifice-induced pressure error at high Reynolds numbers
[NASA-TP-2537] p 339 N86-20351

**STATIC STABILITY**
An experimental study of the lift, drag and static longitudinal stability for a three lifting surface configuration
[AIAA PAPER 86-0398] p 365 A86-26629
The effect of changes in the static strength of a structure during service on the reliability of aircraft
p 384 A86-28322
Strength analysis of flight vehicles --- Russian book
p 356 A86-29842

**STEADY FLOW**
Semi-empirical simulation of steady and unsteady rotor blade aerodynamic loading p 336 A86-27656
A perturbative lambda formulation --- for compressible flow p 337 A86-28535
Transonic flow calculations for aircraft
p 338 A86-29474

**STEP FUNCTIONS**
Design of direct digital flight-mode control systems for high-performance aircraft using step-response matrices
p 367 A86-28387

**STORM SUPPRESSION**
Weather radar studies
[AD-A161622] p 394 N86-22061

**STOWAGE (ONBOARD EQUIPMENT)**
Galley and overhead compartment experiment results: Full-scale transport controlled impact demonstration
[DOT/FAA/CT-85/33] p 343 N86-20378

**STRAIN GAGES**
Impact dynamics instrumentation p 392 N86-21948

**STRAPDOWN INERTIAL GUIDANCE**
The use of microcomputers in inertial navigation systems with strapdown sensors and for measurement systems of average accuracy --- German thesis p 347 A86-27849
Concept and performance analysis of a strapdown northfinder p 349 A86-28361

**STRESS ANALYSIS**
Reliability and failure prevention through ESA in the 80's And beyond p 381 A86-26937
Fretting fatigue testing with a fretting bridge equipment Stress analysis, amplitudes of slip, reliability
p 383 A86-27371

**STRESS INTENSITY FACTORS**
Fatigue-crack propagation through titanium welds
p 375 A86-27264

**STRESS MEASUREMENT**
Controlled impact demonstration airframe bending bridges p 391 N86-21943
CID-720 aircraft high-environment flight instrumentation system p 392 N86-21947

**STRUCTURAL ANALYSIS**
Advances in aerospace structural analysis; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 387 A86-28651
Controlled impact demonstration airframe bending bridges p 391 N86-21943
CID-720 aircraft high-environment flight instrumentation system p 392 N86-21947
Equivalent plate analysis of aircraft wing box structures with general planform geometry
[NASA-TM-87697] p 392 N86-21954

**STRUCTURAL DESIGN**
Efficient identification of critical stresses in structures subject to dynamic loads p 380 A86-26682

**STRUCTURAL DESIGN CRITERIA**
Strength analysis of flight vehicles --- Russian book
p 356 A86-29842
Effects of planform geometry on hover performance of a 2-meter-diameter model of a four-bladed rotor
[NASA-TM-87607] p 340 N86-20358
Optimal airframe synthesis for gust loads
[NASA-CR-178047] p 357 N86-20386
Laminated damped fuselage structures
p 389 N86-21916
Integrated damped fuselage structure
p 389 N86-21918

**STRUCTURAL FAILURE**
Controlled impact demonstration airframe bending bridges p 391 N86-21943
Impact dynamics instrumentation p 392 N86-21948

**STRUCTURAL RELIABILITY**
Reliability and failure prevention through ESA in the 80's And beyond p 381 A86-26937
Structural impact and crashworthiness; Proceedings of the International Conference, Imperial College of Science and Technology, London, England, July 16-20, 1984. Volume 1 Keynote Lectures. Volume 2 - Conference Papers p 383 A86-28276
Reliability of the plates and shells of aircraft
p 384 A86-28314
Problems in the dynamics of aircraft structures exposed to intensive acoustic loading p 384 A86-28316
The effect of changes in the static strength of a structure during service on the reliability of aircraft
p 384 A86-28322

**STRUCTURAL STABILITY**
Dynamic stability of elastic structures under random influences p 384 A86-28318
Problems in the stability and dynamics of aircraft structures with physicomechanical singularities
p 384 A86-28321

**STRUCTURAL VIBRATION**
Modal test requirements for coupled structure analysis using experimentally-derived component models
p 380 A86-26878
Energy dissipation connected with vibrations of mechanical systems p 381 A86-27076
Mathematical models for studying aircraft vibrations with allowance for structural hysteresis p 365 A86-27081
Applying I. G. Bubnov's method to the solution of the natural vibration problem for a conical sandwich panel
p 384 A86-28315
The life of reinforced thin-walled structures in a random force field p 384 A86-28319
Vibrations and structureborne noise in space station
[NASA-CR-176520] p 372 N86-20485
A design guide for damping of aerospace structures
p 390 N86-21923
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**SUBSONIC FLOW**
Subsonic flow investigations on a cranked wing designed for high maneuverability
[NASA-CR-178046] p 340 N86-20361

**SUBSONIC SPEED**
Method for the prediction of the installation aerodynamics of a propfan at subsonic speeds: User manual
[NASA-CR-178057] p 340 N86-20360

**SUITS**
Ship/rig personnel abandonment and helicopter crew/passenger immersion suits - The requirements in the North Atlantic p 396 A86-29100

**SUPERCRITICAL AIRFOILS**
Modular application of a shock/boundary layer interaction solution to supercritical viscous-inviscid flow field analysis p 338 N86-20343

**SUPERCRITICAL PRESSURES**
Flight measurements of surface pressures on a flexible supercritical research wing
[NASA-TP-2501] p 339 N86-20350

**SUPERCRITICAL WINGS**
Installation effects of long-duct pylon-mounted nacelles on a twin-jet transport model with swept supercritical wing
[NASA-TP-2457] p 339 N86-20346
Flight measurements of surface pressures on a flexible supercritical research wing
[NASA-TP-2501] p 339 N86-20350

**SUPERHIGH FREQUENCIES**
Aircraft coupling model evaluations at SHF/EHF
p 346 A86-27128

**SUPERPLASTICITY**
Properties of diffusion bonded butt joints in Ti-6Al-4V and Ti-4Al-4Mo-2Sn-0.5Si (IMI 550) alloys
p 375 A86-27260
Advanced structural components by SPF/DB processing --- superplastic forming and diffusion bonding
p 363 A86-27271
Producibility of aircraft structural parts by superplastic forming and diffusion bonding p 382 A86-27272
Structural evaluation of superplastic aluminum. Part 1. Mechanical, corrosion, metallurgical data
[AD-A161366] p 379 N86-21662

**SUPERSONIC AIRCRAFT**
Exploratory low-speed wind-tunnel study of concepts designed to improve aircraft stability and control at high angles of attack
[NASA-CR-176615] p 338 N86-20344
Effect of underwing aft-mounted nacelles on the longitudinal aerodynamic characteristics of a high-wing transport airplane
[NASA-TP-2447] p 339 N86-20345

**SUPERSONIC SPEEDS**
Research on the aerodynamic characteristics of vehicles by free flight testing at supersonic speeds
[NAL-TR-876] p 339 N86-20353

**SUPERSONIC TURBINES**
Forced response analysis of an aerodynamically detuned supersonic turbomachine rotor
p 363 A86-26902

**SURFACE DEFECTS**
Fatigue behaviour of titanium materials in aircraft engines p 375 A86-27275

**SURFACE ROUGHNESS**
Runway rubber removal specification development
[DOT/FAA/PN-85/33] p 372 N86-21556

**SURFACE ROUGHNESS EFFECTS**
Verification and application of the icing scaling equations
[AIAA PAPER 86-0481] p 343 A86-26640

**SURFACE STABILITY**
An experimental study of the lift, drag and static longitudinal stability for a three lifting surface configuration
[AIAA PAPER 86-0398] p 365 A86-26629

**SURVEYS**
A constant altitude flight survey method for mapping atmospheric ambient pressures and systematic radar errors p 380 A86-28507

**SURVIVAL EQUIPMENT**
Ship/rig personnel abandonment and helicopter crew/passenger immersion suits - The requirements in the North Atlantic p 396 A86-29100

**SUSPENDING (HANGING)**
Low-speed stability characteristics of a helicopter with a sling load p 365 A86-26586

**SWEPT FORWARD WINGS**
Multivariable control law design for the X-29 aircraft
p 369 A86-28510
A programme of research into the aerodynamics, stability and control characteristics of a combat aircraft having a forward swept wing p 357 N86-21533

**SWEPT WINGS**
Comment on 'Conical similarity of shock/boundary-layer interactions generated by swept and unswept wings'
p 337 A86-28558
Subsonic flow investigations on a cranked wing designed for high maneuverability
[NASA-CR-178046] p 340 N86-20361

**SWITCHING CIRCUITS**
A novel voice activated switch (VOX) for high noise environments p 348 A86-28335

**SYNTHESIS (CHEMISTRY)**
Copolymers of vinyl styrylpyridines or vinyl stilbazoles with bismaleimide
[NASA-CASE-ARC-11429-1-CU] p 378 N86-20560

**SYNTHETIC RESINS**
Copolymers of vinyl styrylpyridines or vinyl stilbazoles with bismaleimide
[NASA-CASE-ARC-11429-1-CU] p 378 N86-20560
A design guide for damping of aerospace structures
p 390 N86-21923

**SYSTEM EFFECTIVENESS**
Integration effects of underwing forward- and rearward-mounted separate-flow, flow-through nacelles on a high-wing transport
[NASA-TM-87627] p 342 N86-21514

**SYSTEM FAILURES**
Application of fuzzy logic to the estimation of software reliability for computer systems p 396 A86-27472
Detection and isolation of control surface effectiveness failures in high performance aircraft p 367 A86-28392

**SYSTEM IDENTIFICATION**
Experimental system identification for experimental/analytical correlation and modelling
p 381 A86-26883

STEP and STEPSPL: Computer programs for aerodynamic model structure determination and parameter estimation
[NASA-TM-86410] p 370 N86-21549

**SYSTEMS ANALYSIS**

Modeling and simulation. Volume 15 - Proceedings of the Fifteenth Annual Pittsburgh Conference, University of Pittsburgh, PA, April 19, 20, 1984. Part 5 - General modeling and simulation p 397 A86-28280

**SYSTEMS ENGINEERING**

The McDonnell aircraft telemetry tracking system at Edwards Air Force Base, CA p 346 A86-27784

Wickens' resource allocation model - Implications for the design of human-machine systems
p 395 A86-28453

Modular simulators - A comprehensive unified architecture --- for flight training p 371 A86-28458

Dependable avionic data transmission
p 362 N86-20405

**SYSTEMS INTEGRATION**

High speed fiber optic data bus for avionics integration
p 385 A86-28342

An expert system for integrated aircraft/engine controls design p 355 A86-28405

A new approach to ensuring deterministic processing in an integrated avionics software system
p 398 A86-28419

Embedded training avionics integration
p 360 A86-28463

Onboard simulation - A demonstrated technology breakthrough for cost effective testing and training
p 360 A86-28464

**SYSTEMS SIMULATION**

Modeling and simulation. Volume 15 - Proceedings of the Fifteenth Annual Pittsburgh Conference, University of Pittsburgh, PA, April 19, 20, 1984. Part 5 - General modeling and simulation p 397 A86-28280

## T

**TACAN**

A new system simultaneously covering en route navigation and landing p 348 A86-27898

**TAIL ASSEMBLIES**

Aerodynamic characteristics of several current helicopter tail boom cross sections including the effect of spoilers
[NASA-TP-2506] p 339 N86-20349

**TAILLESS AIRCRAFT**

Aircraft of special configurations --- Russian book
p 335 A86-28521

**TAKEOFF**

Thrust-vectored takeoff, landing, and ground handling of an airship p 343 A86-28571

**TAKEOFF RUNS**

STALINS method for takeoff and landing trajectory measurements p 356 A86-28566

**TANDEM WING AIRCRAFT**

The joined wing - An overview --- aircraft tandem wings in diamond configurations p 355 A86-28559

**TARGET ACQUISITION**

Adaptive field of view expansion via multiple model filtering for tracking dynamic target images
p 359 A86-28371

LANTIRN flight test - Opening the night window --- Low Altitude Navigation and Targeting Infrared System for Night p 361 A86-28842

Detection of non-moving targets by airborne mm-wave radars p 351 A86-29783

**TASK COMPLEXITY**

Wickens' resource allocation model - Implications for the design of human-machine systems
p 395 A86-28453

Low cost part task trainer for the GBU-15 guided bomb p 370 A86-28457

Evaluation of 16 measures of mental workload using a simulated flight task emphasizing mediational activity
p 395 A86-28864

Head-up/head-down transition - Measurement of transition times p 396 A86-29092

**TECHNOLOGICAL FORECASTING**

What does the future hold for 1990's new airframe materials p 373 A86-26328

2010 - The symbionic cockpit p 355 A86-28455

Expert system applications to the cockpit of the '90s
p 399 A86-28487

Structural materials in aeronautics: Prospects and perspectives
[RAE-TR-85077] p 357 N86-21532

Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443

**TECHNOLOGY ASSESSMENT**

The development status of JTIDS dual mode TDMA and distributed TDMA (DTDMA) full scale development terminals - An update p 351 A86-28473

Aircraft of special configurations --- Russian book
p 335 A86-28521

State-of-the-art review on composite material fatigue/damage tolerance
[FAA/CT-85/7] p 379 N86-21615

**TECHNOLOGY TRANSFER**

Japan report: Science and technology
[JPRS-JST-86-001] p 389 N86-21723

**TECHNOLOGY UTILIZATION**

Structural materials in aeronautics: Prospects and perspectives
[RAE-TR-85077] p 357 N86-21532

**TELECOMMUNICATION**

Frequency synthesis type airborne transmitters
p 347 A86-27819

**TELEMETRY**

The McDonnell aircraft telemetry tracking system at Edwards Air Force Base, CA p 346 A86-27784

TSPI data processing in the telemetry environment --- Time Space Position Information for flight tests
p 347 A86-27804

Remote aircraft maintenance monitoring using telemetry p 347 A86-27813

Frequency synthesis type airborne transmitters
p 347 A86-27819

Controlled impact demonstration on-board (interior) photographic system p 392 N86-21946

**TEMPERATURE CONTROL**

Improved reliability of electronic circuits through the use of heat pipes p 386 A86-28479

**TEMPERATURE EFFECTS**

Jet plume temperature effects on afterbody pressure distribution and drag
[NAL-TM-FM-8502] p 340 N86-20354

**TEMPERATURE MEASUREMENT**

Cryogenic tunnel measurement of total temperature and pressure p 387 A86-28570

**TENSILE PROPERTIES**

Fatigue properties of Ti-10V-2Fe-03Al
p 375 A86-27274

**TENSILE STRENGTH**

Strength profile in Al-Li plate material
p 374 A86-27198

**TERRAIN**

Interpolation of heights and slopes from a digital terrain elevation model
[BAE-BT-13198] p 352 N86-20382

**TERRAIN ANALYSIS**

A comparison of digital terrain models and terrain masking algorithms p 350 A86-28391

A FORTRAN algorithm for terrain perspective and plan view display p 398 A86-28421

**TERRAIN FOLLOWING AIRCRAFT**

Demonstration of an innovative technique for Terrain Following/Terrain Avoidance - The Dynapath Algorithm
p 350 A86-28389

Implementation of TF/TA in the digital terrain management and display system p 359 A86-28390

**TEST EQUIPMENT**

Electromagnetic pulse test aircraft (EMPTAC) program
p 335 A86-27145

**TEXTILES**

Analytical and experimental studies of textile structural composites p 377 A86-27652

**TEXTURES**

Rubber removal specification development
[FAA/PM-85/33] p 371 N86-21555

**THERMAL ENERGY**

Method for improving the fuel efficiency of a gas turbine engine
[NASA-CASE-LEW-13142-2] p 384 N86-20389

**THERMAL FATIGUE**

High temperature fatigue behavior of IMI 685
p 376 A86-27385

**THERMAL RESISTANCE**

Contact heat transfer - The last decade
p 387 A86-28551

**THERMOCOUPLES**

A numerical and experimental investigation of electrochemical aircraft deicing
[NASA-CR-175024] p 344 N86-20380

**THERMOMECHANICAL TREATMENT**

The thermo-mechanical processing during closed die forging - A method of improving aeronautical materials
p 380 A86-26336

**THIN WALLED SHELLS**

The life of reinforced thin-walled structures in a random force field p 384 A86-28319

**THREE DIMENSIONAL BOUNDARY LAYER**

An experimental study of the flow and wall pressure field around a wing-body junction p 337 A86-28637

Three-dimensional and unsteady boundary-layer computations p 338 A86-29415

Three-dimensional boundary layer analysis program Blay and its application
[NASA-TM-77962] p 342 N86-21516

**THREE DIMENSIONAL FLOW**

Vortex flows in aerodynamics p 338 A86-29417

A preliminary note on the development of a three dimensional potential code in Cartesian Coordinates
[NAL-TM-AE-8504] p 399 N86-21233

**THRUST**

Asymmetric thrust warning system for dual engine aircraft
[AD-D011960] p 361 N86-20387

**THRUST CONTROL**

Procedure for utilizing the lift and thrust forces of ornithopters
[NASA-TM-77682] p 357 N86-21534

**THRUST RE[illegible]SAL**

Materia[illegible]hrust reversers p 373 A86-26332

**THRUST VECTOR CONTROL**

Thrust-vectored takeoff, landing, and ground handling of an airship p 343 A86-28571

Propulsion and control propellers with thruster nozzles primarily for aircraft applications
[NASA-TM-77715] p 342 N86-21511

**THUNDERSTORMS**

Weather radar studies
[AD-A161622] p 394 N86-22061

**THYRISTORS**

Power thyristor starter for aircraft engine
p 386 A86-28373

**TILT ROTOR AIRCRAFT**

Analysis of the wing/rotor and rotor/rotor interactions present in tilt-rotor aircraft p 353 A86-27657

**TIME DIVISION MULTIPLE ACCESS**

The development status of JTIDS dual mode TDMA and distributed TDMA (DTDMA) full scale development terminals - An update p 351 A86-28473

**TIME MEASUREMENT**

Head-up/head-down transition - Measurement of transition times p 396 A86-29092

**TITANIUM**

Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volumes 1-4
p 374 A86-27201

Engineer's Guide to Titanium Castings
p 382 A86-27203

Recycling of titanium scrap for the production of high-duty aerospace components p 382 A86-27211

**TITANIUM ALLOYS**

Titanium near net shape components for demanding airframe applications p 380 A86-26717

Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volumes 1-4
p 374 A86-27201

Applications of titanium and titanium alloys
p 374 A86-27202

Engineer's Guide to Titanium Castings
p 382 A86-27203

Titaniium investment casting - Production, properties and applications p 382 A86-27204

An evaluation of centrifugally cast Ti-4Al-4Mo-2Sn-0.5Si (IMI 550) alloy p 374 A86-27207

Requirements for recycling of valuable chips from and for aircraft manufacturing p 374 A86-27209

Development in PM HHDH-Ti6Al4V technology for aircraft application --- High-quality Hydride Dehydriding Process p 375 A86-27224

Ten years of front-fan blade forging
p 382 A86-27227

Effect of processing and heat treatment on the mechanical properties of Ti-6Al-2Sn-4Zr-6Mo alloy
p 375 A86-27231

Isothermal forging system for the production of large rotating components from titanium alloys or superalloys
p 382 A86-27247

Properties of diffusion bonded butt joints in Ti-6Al-4V and Ti-4Al-4Mo-2Sn-0.5Si (IMI 550) alloys
p 375 A86-27260

Fatigue-crack propagation through titanium welds
p 375 A86-27264

Advanced structural components by SPF/DB processing --- superplastic forming and diffusion bonding
p 363 A86-27271

Producibility of aircraft structural parts by superplastic forming and diffusion bonding p 382 A86-27272

Fatigue properties of Ti-10V-2Fe-03Al
p 375 A86-27274

Fatigue behaviour of titanium materials in aircraft engines p 375 A86-27275

EB repair welding of a critical aircraftpart made from the nonweldable titanium alloy 3.7184.7 (Ti-Al4-Mo4-Sn2-Si) p 382 A86-27278

Embrittled trailing edges of compressor blades (titanium alloy Ti6Al-4V and Ti6Al2Sn4Zr2Mo) of gas turbine aero-engines p 376 A86-27279

The fretting fatigue behaviour of the titanium alloy Ti-6Al-4V p 376 A86-27370

The strain controlled fatigue behaviour of a near-alpha titanium alloy p 376 A86-27383

Studies on crack growth rate of high temperature titanium alloys p 376 A86-27384

High temperature fatigue behavior of IMI 685 p 376 A86-27385

Developments in high temperature alloys p 376 A86-27388

Fundamental investigation on the impact strength of hollow fan blades [NAL-TR-879] p 389 N86-20864

**TOMOGRAPHY**

Reconstruction of a three-dimensional, transonic rotor flow field from holographic interferogram data [AIAA PAPER 85-0370] p 337 A86-27669

**TORSIONAL VIBRATION**

A loss of dynamic stability of the torsional vibrations of blades due to cascade flutter p 364 A86-27543

**TOXICITY**

Aircraft mishap fire pattern investigations [AD-A161094] p 344 N86-21528

**TRACKING (POSITION)**

Weather radar studies [AD-A161622] p 394 N86-22061

**TRACKING STATIONS**

The McDonnell aircraft telemetry tracking system at Edwards Air Force Base, CA p 346 A86-27784

**TRAILING EDGES**

Embrittled trailing edges of compressor blades (titanium alloy Ti6Al-4V and Ti6Al2Sn4Zr2Mo) of gas turbine aero-engines p 376 A86-27279

**TRAINING DEVICES**

A case study in simulation vs. stimulation - The B-1 weapon system trainer p 398 A86-28456

Low cost part task trainer for the GBU-15 guided bomb p 370 A86-28457

**TRAINING SIMULATORS**

A speech processing system for an air traffic control radar simulator p 351 A86-28447

Modular simulators - How to make it work --- procurement and logistics for flight-weapon system trainer p 371 A86-28459

Embedded training avionics integration p 360 A86-28463

**TRAJECTORIES**

Motion planning in the presence of moving obstacles [AD-A161374] p 400 N86-22208

**TRAJECTORY CONTROL**

Flight mechanics contributions to the time-based trajectory control in the aircraft longitudinal plane --- German thesis p 348 A86-27852

**TRAJECTORY MEASUREMENT**

STALINS method for takeoff and landing trajectory measurements p 356 A86-28566

**TRAJECTORY OPTIMIZATION**

Demonstration of an innovative technique for Terrain Following/Terrain Avoidance - The Dynapath Algorithm p 350 A86-28389

**TRANSDUCERS**

Study on the digital position transducer with optical time-delay pulse [NAL-TR-878] p 388 N86-20759

Impact dynamics instrumentation p 392 N86-21948

**TRANSFER FUNCTIONS**

Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics p 353 A86-27661

Measurements of ocean wave spectra and modulation transfer function with the airborne two-frequency scatterometer p 393 A86-28618

Computation of transfer function matrices [NAL-TM-SE-8509] p 399 N86-21232

**TRANSIENT RESPONSE**

Unified EM transient protection requirements for aircraft avionics line replaceable units p 355 A86-28485

**TRANSMISSION LOSS**

Application of the finite element method in the calculation of transmission loss of flat and curved panels --- for noise reduction in aircraft p 400 A86-26888

**TRANSMISSIONS (MACHINE ELEMENTS)**

Optimal design of composite power transmission shafting p 353 A86-27654

**TRANSMITTER RECEIVERS**

Minimum operational performance standards for airborne Distance Measuring Equipment (DME) operation within the radio frequency range of 960-1215 megahertz [RTCA/DO-189] p 362 N86-21542

**TRANSMITTERS**

Frequency synthesis type airborne transmitters p 347 A86-27819

**TRANSOCEANIC COMMUNICATION**

A satellite system for aeronautical data communications [AIAA PAPER 86-0602] p 351 A86-29578

**TRANSOCEANIC FLIGHT**

The golden age of the great passenger airships: Graf Zeppelin and Hindenburg --- Book p 403 A86-27648

**TRANSONIC FLOW**

An engineering approach to the inverse transonic wing design problem p 336 A86-26409

Reconstruction of a three-dimensional, transonic rotor flow field from holographic interferogram data [AIAA PAPER 85-0370] p 337 A86-27669

Numerical optimization design of advanced transonic wing configurations p 356 A86-28562

Steady and unsteady transonic pressure distributions on NACA 0012 p 337 A86-28565

Transonic flow calculations for aircraft p 338 A86-29474

The application to airfoils of a technique for reducing orifice-induced pressure error at high Reynolds numbers [NASA-TP-2537] p 339 N86-20351

A preliminary note on the development of a three dimensional potential code in Cartesian Coordinates [NAL-TM-AE-8504] p 399 N86-21233

A viscous-inviscid interaction method to predict the aerodynamic performance of airfoils at transonic speed [NAL-TR-873] p 341 N86-21508

**TRANSONIC SPEED**

A viscous-inviscid interaction method to predict the aerodynamic performance of airfoils at transonic speed [NAL-TR-873] p 341 N86-21508

**TRANSONIC WIND TUNNELS**

Cryogenic tunnel measurement of total temperature and pressure p 387 A86-28570

**TRANSPORT AIRCRAFT**

An integrated flight control system for a STOL transport aircraft p 367 A86-28384

Measurements of the response of transport aircraft ceiling panels to fuel fires p 343 A86-28564

Transonic flow calculations for aircraft p 338 A86-29474

Effect of underwing aft-mounted nacelles on the longitudinal aerodynamic characteristics of a high-wing transport airplane [NASA-TP-2447] p 339 N86-20345

Installation effects of long-duct pylon-mounted nacelles on a twin-jet transport model with swept supercritical wing [NASA-TP-2457] p 339 N86-20346

Galley and overhead compartment experiment results: Full-scale transport controlled impact demonstration [DOT/FAA/CT-85/33] p 343 N86-20378

Strength of graphite/epoxy bolted wing-skin splice specimens subjected to outdoor exposure under constant load and yearly fatigue loading [NASA-TP-2542] p 378 N86-20508

Aircraft interior panel test criteria derived from full-scale fire tests [AD-A161637] p 345 N86-21529

CID overview p 390 N86-21934

NASA experiments on the B-720 structure and seats p 390 N86-21936

NASA seat experiment and occupant responses p 390 N86-21939

Structural loads preliminary results p 391 N86-21940

Digital filtering and acceleration pulse interpretation p 400 N86-21941

Preliminary floor, seat, and dummy data p 391 N86-21942

Controlled impact demonstration airframe bending bridges p 391 N86-21943

Controlled impact demonstration flight data recorders/cockpit voice recorders p 391 N86-21944

United States Navy - Canadian forces solid state flight data recorder/crash position locator experiment on the B-720 controlled impact demonstration p 391 N86-21945

Controlled impact demonstration on-board (interior) photographic system p 392 N86-21946

CID-720 aircraft high-environment flight instrumentation system p 392 N86-21947

Impact dynamics instrumentation p 392 N86-21948

CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949

**TURBINE BLADES**

The evolution of turbine blade materials p 373 A86-26330

The effect of limiting aerodynamic and structural coupling in models of mistuned bladed disk vibration p 363 A86-26905

The fretting fatigue behaviour of the titanium alloy Ti-6Al-4V p 376 A86-27370

A unified method for evaluating the strength and reliability of the blades of the axial-flow compressors and gas turbines of aircraft engines p 364 A86-28317

**TURBOCOMPRESSORS**

A unified method for evaluating the strength and reliability of the blades of the axial-flow compressors and gas turbines of aircraft engines p 364 A86-28317

**TURBOFAN ENGINES**

Will 1990s aircraft be powered by propfan or advanced turbofan? p 363 A86-26370

Ten years of front-fan blade forging p 382 A86-27227

**TURBOJET ENGINES**

High frequency-heated air turbojet [NASA-TM-77710] p 364 N86-21543

Dual material exhaust nozzle flap [AD-D011998] p 364 N86-21548

**TURBOPROP AIRCRAFT**

Flight Test Instrumentation System FTIS for type-certification of the Indonesian aircraft CN 235 p 358 A86-27818

**TURBULENCE**

Analysis of aerodynamic coefficients using gradient data: Spanwise turbulence effects on airplane response [NASA-CR-3961] p 393 N86-21069

Weather radar studies [AD-A161622] p 394 N86-22061

**TURBULENCE EFFECTS**

The effects of atmospheric turbulence on an air-to-air optical communication link p 351 A86-28470

Numerical synthesis of tri-variate velocity realizations of turbulence p 387 A86-28654

**TURBULENT BOUNDARY LAYER**

An experimental study of the flow and wall pressure field around a wing-body junction p 337 A86-28637

**TURBULENT FLOW**

Vortex conception of rotor and mutual effect of screw/propellers [NASA-TM-77979] p 342 N86-21510

**TURBULENT WAKES**

Two methods for viscous and inviscid free-wake analysis of helicopter rotors [AD-A161513] p 342 N86-21521

**TWO DIMENSIONAL BOUNDARY LAYER**

Modular application of a shock/boundary layer interaction solution to supercritical viscous-inviscid flow field analysis p 338 N86-20343

**TWO DIMENSIONAL FLOW**

New techniques for experimental generation of two-dimensional blade-vortex interaction at low Reynolds numbers [NASA-TP-2551] p 401 N86-21280

## U

**ULTRALIGHT AIRCRAFT**

Ultralight aircraft - A need for better regulation than 14 C.F.R. Section 103 --- in air law p 343 A86-28000

Safety study: Ultraviolet vehicle accidents [PB85-917001] p 343 N86-20377

**ULTRASONIC FLAW DETECTION**

Reliable nondestructive testing - The key to using weldments in critical fighter aircraft structure p 380 A86-26544

**ULTRASONIC WAVE TRANSDUCERS**

Ultrasonic liquid quantity measurement --- in oils p 360 A86-28478

**UNSTEADY FLOW**

Semi-empirical simulation of steady and unsteady rotor blade aerodynamic loading p 336 A86-27656

Tail profile effects on unsteady large scale flow structure in the wing and plate junction p 387 A86-28666

Three-dimensional and unsteady boundary-layer computations p 338 A86-29415

New techniques for experimental generation of two-dimensional blade-vortex interaction at low Reynolds numbers [NASA-TP-2551] p 401 N86-21280

**UNSWEPT WINGS**

Comment on 'Conical similarity of shock/boundary-layer interactions generated by swept and unswept wings' p 337 A86-28558

**UPPER ATMOSPHERE**

Weather radar studies [AD-A161622] p 394 N86-22061

**USER MANUALS (COMPUTER PROGRAMS)**

Airport-Noise Levels and Annoyance Model (ALAMO) system's reference manual [NASA-TM-87694] p 401 N86-22305

## V

**V/STOL AIRCRAFT**
Numerical simulation of a controlled-flow tunnel for V/STOL testing p 371 A86-28561
**VARIABLE GEOMETRY STRUCTURES**
Matrix equations of the spatial flight of an asymmetrical rigid body p 365 A86-27446
**VELOCITY DISTRIBUTION**
Numerical synthesis of tri-variate velocity realizations of turbulence p 387 A86-28654
**VERTICAL FLIGHT**
Vertically operating flight vehicle for drilling and agricultural use
[NASA-TM-77713] p 357 N86-21535
**VERTICAL TAKEOFF AIRCRAFT**
Characteristics of the effect of the powerplant jet streams on the design of VTOL aircraft
p 354 A86-28320
**VHF OMNIRANGE NAVIGATION**
Design considerations for Doppler VOR ground station antenna arrangement p 349 A86-28360
**VIBRATION DAMPING**
Application of modern structural optimization to vibration reduction in rotorcraft p 352 A86-26587
Energy dissipation connected with vibrations of mechanical systems p 381 A86-27076
The damping capacity of layered materials
p 374 A86-27084
Structural dynamic aspects of rotor antiresonant isolation p 353 A86-27663
Limiting performance of nonlinear systems with applications to helicopter vibration control
[AD-A161457] p 370 N86-21551
Laminated damped fuselage structures
p 389 N86-21916
Beam dampers for skin vibration and noise reduction in the 747 p 389 N86-21917
Use of skin damping treatments to control airframe dynamic response for interior noise control
p 389 N86-21919
A design guide for damping of aerospace structures
p 390 N86-21923
**VIBRATION EFFECTS**
The role of vibration and rattle in human response to helicopter noise
[AD-A162486] p 396 N86-22110
**VIBRATION ISOLATORS**
Segmented tubular cushion springs and spring assembly
[NASA-CASE-ARC-11349-1] p 388 N86-20797
Beam dampers for skin vibration and noise reduction in the 747 p 389 N86-21917
**VIBRATION SIMULATORS**
Rotating aerodynamic exciters for in-flight flutter testing p 353 A86-27820
**VIBRATION TESTS**
CID-720 aircraft Langley Research Center preflight hardware tests: Development, flight acceptance and qualification p 392 N86-21949
**VIDEO EQUIPMENT**
Electronic display luminance and gray scale control -- for military aircraft p 360 A86-28505
**VINYL COPOLYMERS**
Copolymers of vinyl styrylpyridines or vinyl stilbazoles with bismaleimide
[NASA-CASE-ARC-11429-1-CU] p 378 N86-20560
**VISCOELASTIC DAMPING**
Integrated damped fuselage structure
p 389 N86-21918
A design guide for damping of aerospace structures
p 390 N86-21923
**VISCOUS FLOW**
A viscous-inviscid interaction method to predict the aerodynamic performance of airfoils at transonic speed
[NAL-TR-873] p 341 N86-21508
**VISION**
Selection of a man-modelling CAD (Computer-Aided Design)
[AD-A161342] p 400 N86-22159
**VOICE COMMUNICATION**
Improving intelligibility in audio distribution systems
p 395 A86-28513
Controlled impact demonstration flight data recorders/cockpit voice recorders p 391 N86-21944
**VOICE CONTROL**
A novel voice activated switch (VOX) for high noise environments p 348 A86-28335
Selecting cockpit functions for speech I/O technology
p 395 A86-28446
A speech processing system for an air traffic control radar simulator p 351 A86-28447
**VOICE DATA PROCESSING**
Selecting cockpit functions for speech I/O technology
p 395 A86-28446
A speech processing system for an air traffic control radar simulator p 351 A86-28447
**VORTEX GENERATORS**
New techniques for experimental generation of two-dimensional blade-vortex interaction at low Reynolds numbers
[NASA-TP-2551] p 401 N86-21280
**VORTEX RINGS**
A ring-vortex downburst model for flight simulations
p 393 A86-28568
**VORTEX SHEDDING**
A visualisation study of the vortex flow around double-delta wings
[ARL-AERO-R-165] p 340 N86-20362
**VORTEX SHEETS**
Vortex flows in aerodynamics p 338 A86-29417
**VORTICES**
Helicopter model rotor-blade vortex interaction impulsive noise - Scalability and parametric variations
p 400 A86-27658
A wake model for high resolution airloads
p 336 A86-27666
Tail profile effects on unsteady large scale flow structure in the wing and plate junction p 387 A86-28666
Side force characteristics of a 20 deg cone at high angles of attack
[NAL-TM-AE-8503] p 340 N86-20356
Subsonic flow investigations on a cranked wing designed for high maneuverability
[NASA-CR-178046] p 340 N86-20361
Vortex conception of rotor and mutual effect of screw/propellers
[NASA-TM-77979] p 342 N86-21510
**VORTICITY TRANSPORT HYPOTHESIS**
Material contravariant components - Vorticity transport and vortex theorems p 387 A86-28553
**VULNERABILITY**
Application of PRA to HEMP vulnerability analysis
[DE86-001781] p 399 N86-21260

## W

**WALL PRESSURE**
An experimental study of the flow and wall pressure field around a wing-body junction p 337 A86-28637
**WARNING SYSTEMS**
Detection and isolation of control surface effectiveness failures in high performance aircraft p 367 A86-28392
Asymmetric thrust warning system for dual engine aircraft
[AD-D011960] p 361 N86-20367
The Stapleton microburst advisory service project: An operational viewpoint
[AD-A161543] p 394 N86-21078
**WASTE ENERGY UTILIZATION**
Method for improving the fuel efficiency of a gas turbine engine
[NASA-CASE-LEW-13142-2] p 364 N86-20389
**WATER**
Diffusion of water in carbon epoxy composites
p 377 A86-27754
**WATER IMMERSION**
Ship/rig personnel abandonment and helicopter crew/passenger immersion suits - The requirements in the North Atlantic p 396 A86-29100
**WAVE PROPAGATION**
Proceedings of the 1985 ONR/NAVAIR Wave Rotor Research and Technology Workshop
[AD-A161539] p 389 N86-20813
**WAVEGUIDE ANTENNAS**
Mechanical design and evaluation of a slotted CFRP waveguide antenna p 383 A86-27703
**WEAPON SYSTEM MANAGEMENT**
A Modular Stress Management System (MSMS) with worldwide applications p 359 A86-28367
**WEAPON SYSTEMS**
Electromagnetic pulse test aircraft (EMPTAC) program
p 335 A86-27145
State estimation errors in digital Kalman filters caused by measurement delays and numerical integration
p 397 A86-28368
A case study in simulation vs. stimulation - The B-1 weapon system trainer p 398 A86-28456
Low cost part task trainer for the GBU-15 guided bomb p 370 A86-28457
Modular simulators - How to make it work --- procurement and logistics for flight-weapon system trainer
p 371 A86-28459
Onboard simulation - A demonstrated technology breakthrough for cost effective testing and training
p 360 A86-28464
**WEATHER**
Weather radar studies
[AD-A161622] p 394 N86-22061
**WEATHER FORECASTING**
Forecasting for civil aviation. I p 393 A86-29002
**WEATHER MODIFICATION**
AN-30 photography airplane outfitted for cloud-seeding missions p 393 N86-20888
**WEIGHTING FUNCTIONS**
An evaluation of study design for estimating a time-of-day noise weighting
[NASA-CR-178062] p 401 N86-22306
**WELD TESTS**
Reliable nondestructive testing - The key to using weldments in critical fighter aircraft structure
p 380 A86-26544
**WELDED JOINTS**
Fatigue-crack propagation through titanium welds
p 375 A86-27264
**WELDING**
Structural evaluation of superplastic aluminum. Part 1. Mechanical, corrosion, metallurgical data
[AD-A161366] p 379 N86-21662
**WHITE NOISE**
Covariance specification for the linear time-invariant output-feedback control systems using a Kalman filter
[NAL-TR-882] p 388 N86-20677
**WIND EFFECTS**
Algorithms for the automatic four-dimensional guidance of aircraft, taking into account the current wind situation
[ESA-TT-908] p 352 N86-21531
**WIND MEASUREMENT**
Wind shear measurement on board a Morane 893
p 394 N86-21084
**WIND SHEAR**
A ring-vortex downburst model for flight simulations
p 393 A86-28568
The Stapleton microburst advisory service project: An operational viewpoint
[AD-A161543] p 394 N86-21078
Wind shear measurement on board a Morane 893
p 394 N86-21084
Weather radar studies
[AD-A161622] p 394 N86-22061
**WIND TUNNEL CALIBRATION**
Wind tunnel calibration of a flow direction sensor and a pitot-static tube to high angles of attack and sideslip
p 359 A86-28364
**WIND TUNNEL MODELS**
Avoiding probe to model collisions in wind tunnel testing p 397 A86-28413
**WIND TUNNEL STABILITY TESTS**
Direct derivative measurements in the presence of sting plunging p 371 A86-28560
**WIND TUNNEL TESTS**
Avoiding probe to model collisions in wind tunnel testing p 397 A86-28413
Numerical simulation of a controlled-flow tunnel for V/STOL testing p 371 A86-28561
An experimental study of the flow and wall pressure field around a wing-body junction p 337 A86-28637
Exploratory low-speed wind-tunnel study of concepts designed to improve aircraft stability and control at high angles of attack
[NASA-CR-176615] p 338 N86-20344
Integration effects of underwing forward- and rearward-mounted separate-flow, flow-through nacelles on a high-wing transport
[NASA-TM-87627] p 342 N86-21514
A new method for laminar boundary layer transition visualization in flight: Color changes in liquid crystal coatings
[NASA-TM-87666] p 342 N86-21518
Air force technical objective document, flight dynamics laboratory plans for fiscal year 1987
[AD-A162792] p 402 N86-22443
**WING LOADING**
Comparison of discrete and continuous gust methods for airplane design loads determination
p 356 A86-28567
**WING OSCILLATIONS**
Steady and unsteady transonic pressure distributions on NACA 0012 p 337 A86-28565
**WING PLANFORMS**
The joined wing - An overview --- aircraft tandem wings in diamond configurations p 355 A86-28559
An attached flow design of a noninterfering leading-edge extension to a thick delta wing p 337 A86-28569
Equivalent plate analysis of aircraft wing box structures with general planform geometry
[NASA-TM-87697] p 392 N86-21954
**WING PROFILES**
Numerical optimization design of advanced transonic wing configurations p 356 A86-28542
Procedure for utilizing the lift and thrust forces of ornithopters
[NASA-TM-77682] p 357 N86-21534

Effects of wing modification on an aircraft's aerodynamic parameters as determined from flight data
[NASA-TM-87591] p 370 N86-21550

**WING-FUSELAGE STORES**

Numerical analysis of inviscid flows about wing-fuselage combinations. 2: Development of full potential flow code YOKUDO-P
[NAL-TR-881] p 341 N86-20364

**WINGS**

An engineering approach to the inverse transonic wing design problem p 336 A86-26409

Aerodynamics. Part 1 - Fundamentals of theory. Aerodynamics of an airfoil and a wing --- Book
p 338 A86-29840

Strength of graphite/epoxy bolted wing-skin splice specimens subjected to outdoor exposure under constant load and yearly fatigue loading
[NASA-TP-2542] p 378 N86-20508

Piezoelectric deicing device
[NASA-CASE-LEW-13773-2] p 388 N86-20671

A preliminary note on the development of a three dimensional potential code in Cartesian Coordinates
[NAL-TM-AE-8504] p 399 N86-21233

**WORKLOADS (PSYCHOPHYSIOLOGY)**

Evaluation of 16 measures of mental workload using a simulated flight task emphasizing mediational activity
p 395 A86-28864

**WORKSTATIONS**

Instructor station for the ILLIMAC general aviation instrument training simulator p 371 A86-28462

**WROUGHT ALLOYS**

Isothermal forging system for the production of large rotating components from titanium alloys or superalloys
p 382 A86-27247

## X

**X-29 AIRCRAFT**

Development of hardware for X-29A flight control system p 366 A86-28379

Multivariable control law design for the X-29 aircraft
p 369 A86-28510

Advancing flight control technology
p 369 A86-29058

**XV-15 AIRCRAFT**

Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics
p 353 A86-27661

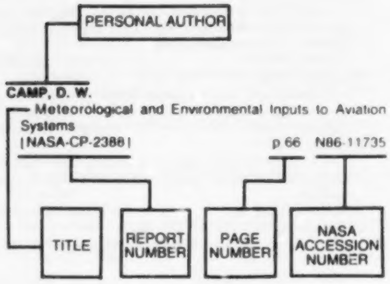
## Y

**YIELD STRENGTH**

Strength profile in Al-Li plate material
p 374 A86-27198

# PERSONAL AUTHOR INDEX

### Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**ABEYOUNIS, W. K.**
Effect of underwing aft-mounted nacelles on the longitudinal aerodynamic characteristics of a high-wing transport airplane
[NASA-TP-2447] p 339 N86-20345
Integration effects of underwing forward- and rearward-mounted separate-flow, flow-through nacelles on a high-wing transport
[NASA-TM-87627] p 342 N86-21514

**ACKERSON, J. W.**
Low cost part task trainer for the GBU-15 guided bomb p 370 A86-28457

**AIKEN, E. W.**
Effects of side-stick controllers on rotorcraft handling qualities for terrain flight p 366 A86-27659

**ALBANES, W.**
IV&V for the automatic test control system in the USAF Aeropropulsion Systems Test Facility
p 398 A86-28430

**ALBER, H. J.**
A dual channel high speed fiber optics multiplex data bus system p 386 A86-28344

**ALDEN, R.**
Lockheed-Georgia and electric primary flight control systems p 368 A86-28396

**ALFARO-BOU, E.**
NASA experiments on the B-720 structure and seats
p 390 N86-21936
Structural loads preliminary results
p 391 N86-21940

**ALLGAIER, H. J.**
Activities report of the aerospace industry in West Germany
[ISSN-0176-5086] p 403 N86-22450

**ALTHOFF, S. L.**
Effects of planform geometry on hover performance of a 2-meter-diameter model of a four-bladed rotor
[NASA-TM-87607] p 340 N86-20358

**AMORY, R. L.**
State-of-the-art review on composite material fatigue/damage tolerance
[FAA/CT-85/7] p 379 N86-21615

**ANDERLE, F.**
Isothermal forging system for the production of large rotating components from titanium alloys or superalloys
p 382 A86-27247

**ANDERSON, B. M.**
Knowledge engineering for a flight management expert system p 368 A86-28498

**ANDREN, C. F.**
Digital chirp demodulation p 385 A86-28332

**ANTHONY, D. G.**
Tail profile effects on unsteady large scale flow structure in the wing and plate junction p 387 A86-28666

**ARCHER, H. S., III**
Digital avionics for modern aircraft - A case study into the problems and promise of aircraft electronics
p 358 A86-28346

**ARNOLD, P. B.**
YF16CCV flight control system reconfiguration design using quantitative feedback theory p 368 A86-28395

**AVDONIN, A. S.**
Strength analysis of flight vehicles
p 356 A86-29842

## B

**BABICH, O. A.**
A combined optimal algorithm for filtering and calculating navigation coordinates p 348 A86-28311

**BACK, L. H.**
Measurements of the response of transport aircraft ceiling panels to fuel fires p 343 A86-28564

**BAIRD, C. A.**
Design techniques for improved map-aided navigation
p 349 A86-28357

**BAJCAR, R. C.**
Application of magneto-optic modulators to advanced avionic displays p 360 A86-28506

**BAKER, T. S.**
Properties of diffusion bonded butt joints in Ti-6Al-4V and Ti-4Al-4Mo-2Sn-0.5Si (IMI 550) alloys
p 375 A86-27260

**BALALAEV, V. A.**
A loss of dynamic stability of the torsional vibrations of blades due to cascade flutter p 364 A86-27543

**BALASUBRAMANIAM, R.**
Modal analysis of a typical fighter aircraft using transient testing technique
[NAL-TM-ST-8517] p 356 N86-20385

**BALAZS, A. J.**
Embedded training avionics integration
p 360 A86-28463

**BANKS, B. A.**
Piezoelectric deicing device
[NASA-CASE-LEW-13773-2] p 388 N86-20671

**BANKSTON, C. P.**
Measurements of the response of transport aircraft ceiling panels to fuel fires p 343 A86-28564

**BANSBACH, H.**
Omega - Commercial experiences with a mature system p 345 A86-26442

**BARBER, R.**
CID flight/impact p 390 N86-21935

**BARILLOT-CREUZET, J.**
Materials in thrust reversers p 373 A86-26332

**BARRETT, N. M.**
An automatic redesign approach for restructurable control systems p 368 A86-28394

**BARRY, J., JR.**
In-flight simulators p 356 A86-29299

**BARTZ, W. J.**
Synthetic lubricants and working fluids; International Colloquium, 4th, Esslingen, West Germany, January 10-12, 1984, Reports p 378 A86-28096

**BARZILOVICH, E. IU.**
Optimum maintenance of aircraft systems on the basis of their condition with allowance for measurement errors
p 354 A86-28310

**BASIULIS, A.**
Improved reliability of electronic circuits through the use of heat pipes p 386 A86-28479

**BASU, P.**
The effect of limiting aerodynamic and structural coupling in models of mistuned bladed disk vibration
p 363 A86-26905

**BATTERSON, J. G.**
STEP and STEPSPL: Computer programs for aerodynamic model structure determination and parameter estimation
[NASA-TM-86410] p 370 N86-21549

**BAUMAN, E. J.**
State estimation errors in digital Kalman filters caused by measurement delays and numerical integration
p 397 A86-28368

**BEAL, J. M.**
Knowledge engineering for a flight management expert system p 368 A86-28498

**BEAUCHAMP, E. D.**
Aircraft electrical power systems p 364 A86-28508

**BECKER, F.**
Reconstruction of a three-dimensional, transonic rotor flow field from holographic interferogram data
[AIAA PAPER 85-0370] p 337 A86-27669

**BEDDOES, T. S.**
A wake model for high resolution airloads
p 336 A86-27666

**BEDFORD, T. L.**
An overview of the intrasystem EMC analysis program with graphics p 381 A86-27157

**BELMONT, H. H.**
Digital fault tolerant flight actuation systems
p 354 A86-28400
Digital fault-tolerant flight actuation systems
[AFWAL-83-3041] p 362 N86-20408

**BERGGREEN, J.**
Requirements for recycling of valuable chips from and for aircraft manufacturing p 374 A86-27209

**BERMAN, H.**
Advancing flight control technology
p 369 A86-29058

**BERNSTEEN, S.**
Expert system applications to the cockpit of the '90s
p 399 A86-28487

**BESER, J.**
Helicopter flight test demonstration of differential GPS
p 345 A86-26438

**BEYERS, M. E.**
Direct derivative measurements in the presence of sting plunging p 371 A86-28560

**BEZARD, C.**
Procedure for utilizing the lift and thrust forces of ornithopters
[NASA-TM-77682] p 357 N86-21534

**BHARADVAJ, B.**
Two methods for viscous and inviscid free-wake analysis of helicopter rotors
[AD-A161513] p 342 N86-21521

**BLAKE, N. A.**
Radionavigation planning in the FAA
p 402 A86-26427

**BLENKINSOP, P. A.**
Developments in high temperature alloys
p 376 A86-27388

**BOGDONOFF, S. M.**
Comment on 'Conical similarity of shock/boundary-layer interactions generated by swept and unswept wings'
p 337 A86-28558

**BOOTH, E., JR.**
New techniques for experimental generation of two-dimensional blade-vortex interaction at low Reynolds numbers
[NASA-TP-2551] p 401 N86-21280

**BOUKIS, G.**
A novel voice activated switch (VOX) for high noise environments p 348 A86-28335

**BOXWELL, D. A.**
Helicopter model rotor-blade vortex interaction impulsive noise - Scalability and parametric variations
p 400 A86-27658

**BOYER, R. R.**
Fatigue properties of Ti-10V-2Fe-03Al
p 375 A86-27274

**BRADLEY, J. W.**
Radionavigation planning in the FAA
p 402 A86-26427

**BRADY, B. J.**
Onboard simulation - A demonstrated technology breakthrough for cost effective testing and training
p 360 A86-28464

**BRAHNEY, J. H.**
Propfan engine designs examined
p 363 A86-26371
CAD/CAM supports flight test modifications
p 356 A86-29823
Solar powered vehicle may fly year-long missions
p 356 A86-29824

**BREEDLOVE, P. M.**
Real-time telemetry of complete 1553 data buses
p 347 A86-27789

**BREEVOORT, C. M.**
A speech recognition research tool for the C-130 Hercules p 350 A86-28443

**BREGLIA, D. R.**
Design considerations for on-board simulation
p 360 A86-28465

**BREZZI, F.**
Numerical methods in fluid dynamics
p 388 A86-29471

**BRIGGS, P.**
An integrated flight control system for a STOL transport aircraft p 367 A86-28384

**BRIGGS, S. M.**
Unified EM transient protection requirements for aircraft avionics line replaceable units p 355 A86-28485

**BROCK, G. L.**
An overview of the intrasystem EMC analysis program with graphics p 381 A86-27157

**BROOKS, C. J.**
Ship/rig personnel abandonment and helicopter crew/passenger immersion suits - The requirements in the North Atlantic p 396 A86-29100

**BROSZEIT, E.**
The fretting fatigue behaviour of the titanium alloy Ti-6Al-4V p 376 A86-27370
Fretting fatigue testing with a fretting bridge equipment Stress analysis, amplitudes of slip, reliability
p 383 A86-27371

**BROWN, A. K.**
Commercial aviation GPS Navigation Set flight test results p 346 A86-28507

**BRUNZELL, S.**
Mechanical design and evaluation of a slotted CFRP waveguide antenna p 383 A86-27703

**BUNK, W.**
Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volumes 1-4
p 374 A86-27201

**BURNETTE, K. T.**
Electronic display luminance and grey scale control
p 360 A86-28505

**BURNSIDE, O. H.**
Advances in aerospace structural analysis; Proceedings of the Winter Annual Meeting, Miami Beach, FL, November 17-22, 1985 p 387 A86-28651

**BUSSE, D. W.**
High stability pressure transducers for air data systems and test sets p 359 A86-28362

**BUTZEL, L. M.**
Integrated damped fuselage structure
p 389 N86-21918

**C**

**CAI, Z.**
Power thyristor starter for aircraft engine
p 386 A86-28373

**CALLOWAY, R. S.**
CID-720 aircraft high-environment flight instrumentation system p 392 N86-21947

**CAMEO, R.**
Materials in thrust reversers p 373 A86-26332

**CANNON, M. R.**
Preliminary floor, seat, and dummy data
p 391 N86-21942

**CAREY, R. S.**
Fatigue properties of Ti-10V-2Fe-03Al
p 375 A86-27274

**CARLSON, J. H.**
Onboard simulation - A demonstrated technology breakthrough for cost effective testing and training
p 360 A86-28464

**CARUSO, R. J.**
Real-time circle generation for raster displays
p 361 A86-28511

**CASALI, J. G.**
Evaluation of 16 measures of mental workload using a simulated flight task emphasizing mediational activity
p 396 A86-28884

**CASARELLA, M. J.**
An experimental study of the flow and wall pressure field around a wing-body junction p 337 A86-28637

**CATHEY, J. J.**
Control of a high-speed, brushless dc motor driven through a cycloconverter line p 386 A86-28372

**CHAN, Y. K.**
Real time optimal flight path generation by storage of massive data bases p 397 A86-28388

**CHANDE, A.**
Expert systems for real time applications
p 398 A86-28486

**CHANDRA MOULY, M. C.**
Design considerations for Doppler VOR ground station antenna arrangement p 349 A86-28360

**CHANDRASEKARAN, B.**
Method for the prediction of the installation aerodynamics of a propfan at subsonic speeds: User manual
[NASA-CR-178057] p 340 N86-20360

**CHAUMETTE, D.**
What does the future hold for 1990's new airframe materials p 373 A86-26328

**CHEN, D. C.**
An expert planner for the dynamic flight environment
p 388 A86-28490

**CHEN, A. P.**
A study of the static post buckling behavior of composite sandwich plates p 383 A86-27663

**CHEN, T. S.**
Copolymers of vinyl styrylpyridines or vinyl stilbazoles with bismaleimide
[NASA-CASE-ARC-11429-1-CU] p 378 N86-20560

**CHENOWETH, C. C.**
Microprocessor controlled and managed fly-by-wire hydraulic actuator p 360 A86-28401

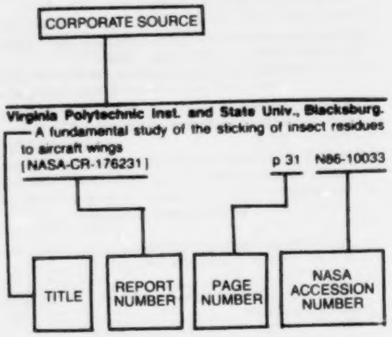
# CORPORATE SOURCE INDEX

### Typical Corporate Source Index Listing



CORPORATE SOURCE
Virginia Polytechnic Inst. and State Univ., Blacksburg.
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231]
p 31
N86-10033
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

**Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).**
Fault Tolerant Hardware/Software Architecture for Flight Critical Function
[AGARD-LS-143] p 369 N86-20399

Recent experiences in the analysis of aircraft cabin noise p 401 N86-21287

## S

**Sandia National Labs., Albuquerque, N. Mex.**
Development drop test results of the 15-ft-dia ribbon parachute and 73-ft-dia cross parachute for the US Army Natick Laboratory UHLCADS system
[DE85-017614] p 341 N86-20371

**Simula, Inc., Phoenix, Ariz.**
Preliminary floor, seat, and dummy data
p 391 N86-21942

**Space Development Corp., Hampton, Va.**
Data reduction, management, and analysis software for CID p 399 N86-21938

## T

**Technische Hochschule, Aachen (West Germany).**
Wind shear measurement on board a Morane 893
p 394 N86-21084

**Technische Hogeschool, Eindhoven (Netherlands).**
A revision of the actuator disk concept and momentum theory
[REPT-R-732-D] p 341 N86-20374

**Texas A&M Univ., College Station.**
An experimental study of the lift, drag and static longitudinal stability for a three lifting surface configuration
[AIAA PAPER 86-0398] p 365 A86-26629

**Toledo Univ., Ohio.**
A numerical and experimental investigation of electrochemical aircraft deicing
[NASA-CR-175024] p 344 N86-20380

**Transportation Systems Center, Cambridge, Mass.**
The Stapleton microburst advisory service project: An operational viewpoint
[AD-A161543] p 394 N86-21078
General aviation pilot and aircraft activity survey
[AD-A161665] p 345 N86-21530

## V

**Vigyan Research Associates, Inc., Hampton, Va.**
Numerical simulation of a controlled-flow tunnel for V/STOL testing p 371 A86-28561
An attached flow design of a noninterfering leading-edge extension to a thick delta wing p 337 A86-28569
Method for the prediction of the installation aerodynamics of a propfan at subsonic speeds: User manual
[NASA-CR-178057] p 340 N86-20360
Subsonic flow investigations on a cranked wing designed for high maneuverability
[NASA-CR-178046] p 340 N86-20361

**Virginia Polytechnic Inst. and State Univ., Blacksburg.**
Efficient identification of critical stresses in structures subject to dynamic loads p 380 A86-26682
Cryogenic tunnel measurement of total temperature and pressure p 387 A86-28570
Evaluation of 16 measures of mental workload using a simulated flight task emphasizing mediational activity
p 395 A86-28864
Development of LC-13C NMR
[NASA-CR-176656] p 379 N86-21704

**Virginia Univ., Charlottesville.**
Limiting performance of nonlinear systems with applications to helicopter vibration control
[AD-A161457] p 370 N86-21551

## W

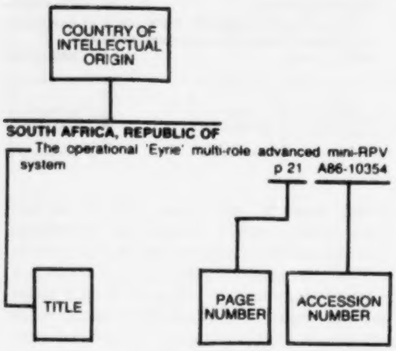
**Washington Univ., Seattle.**
Numerical simulation of a controlled-flow tunnel for V/STOL testing p 371 A86-28561

**Wichita State Univ., Kans.**
Particle trajectory computation on a 3-dimensional engine inlet
[NASA-CR-175023] p 344 N86-20379

# FOREIGN TECHNOLOGY INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 202)* JULY 1986

### Typical Foreign Technology Index Listing



COUNTRY OF INTELLECTUAL ORIGIN
SOUTH AFRICA, REPUBLIC OF
The operational 'Eyrie' multi-role advanced mini-RPV system p 21 A86-10354
TITLE
PAGE NUMBER
ACCESSION NUMBER

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section.

## A

**AUSTRALIA**

Flight testing of an ASW helicopter p 352 A86-26585

Contact heat transfer - The last decade p 387 A86-28551

A visualisation study of the vortex flow around double-delta wings [ARL-AERO-R-165] p 340 N86-20362

Comparison of airborne data acquisition systems at ARL (Aeronautical Research Laboratories) [AD-A161664] p 357 N86-21537

**AUSTRIA**

Recycling of titanium scrap for the production of high-duty aerospace components p 382 A86-27211

## C

**CANADA**

Omega - Commercial experiences with a mature system p 345 A86-26442

Application of magneto-optic modulators to advanced avionic displays p 360 A86-28506

Direct derivative measurements in the presence of sting plunging p 371 A86-28560

Ship/rig personnel abandonment and helicopter crew/passenger immersion suits - The requirements in the North Atlantic p 396 A86-29100

Selection of a man-modelling CAD (Computer-Aided Design) [AD-A161342] p 400 N86-22159

**CHINA, PEOPLE'S REPUBLIC OF**

Development in PM HHDH-Ti6Al4V technology for aircraft application p 375 A86-27224

## F

**FRANCE**

Conference on Steels and Special Alloys in Aeronautics, 11th, Le Bourget, France, June 6, 1985, Proceedings p 372 A86-26326

New developments in the materials used in airliner, helicopter and spacecraft structures p 372 A86-26327

What does the future hold for 1990's new airframe materials p 373 A86-26328

Development of materials used in landing gear p 373 A86-26329

The evolution of turbine blade materials p 373 A86-26330

Materials in thrust reversers p 373 A86-26332

The new aluminium alloys for the aeronautical industry p 373 A86-26334

The thermo-mechanical processing during closed die forging - A method of improving aeronautical materials p 380 A86-26336

The development of high strength stainless steels for the aeronautical industry p 373 A86-26337

Properties and potential aerospace applications of E Z 3 CNDA 13-08 steel. II p 374 A86-26338

Frequency synthesis type airborne transmitters p 347 A86-27819

Rotating aerodynamic exciters for in-flight flutter testing p 353 A86-27820

A new system simultaneously covering en route navigation and landing p 348 A86-27898

Errare humanum est . . . sed perseverare diabolicum or navigation errors of the 747 and the 'heading' position p 348 A86-27900

Head-up/head-down transition - Measurement of transition times p 396 A86-29092

Three-dimensional and unsteady boundary-layer computations p 338 A86-29415

Fault Tolerant Hardware/Software Architecture for Flight Critical Function [AGARD-LS-143] p 369 N86-20399

Dependable avionic data transmission p 362 N86-20405

Producibility and cost studies of aviation kerosene [AGARD-AR-227] p 379 N86-20580

Procedure for utilizing the lift and thrust forces of ornithopters [NASA-TM-77682] p 357 N86-21534

## G

**GERMANY,FEDERAL REPUBLIC OF**

An engineering approach to the inverse transonic wing design problem p 336 A86-26409

Experimental system identification for experimental/analytical correlation and modelling p 381 A86-26883

Strength profile in Al-Li plate material p 374 A86-27198

Titanium: Science and technology; Proceedings of the Fifth International Conference on Titanium, Munich, West Germany, September 10-14, 1984. Volumes 1-4 p 374 A86-27201

Titaniium investment casting - Production, properties and applications p 382 A86-27204

Requirements for recycling of valuable chips from and for aircraft manufacturing p 374 A86-27209

Ten years of front-fan blade forging p 382 A86-27227

Producibility of aircraft structural parts by superplastic forming and diffusion bonding p 382 A86-27272

Fatigue behaviour of titanium materials in aircraft engines p 375 A86-27275

EB repair welding of a critical aircraftpart made from the nonweldable titanium alloy 3.7184.7 (Ti-Al4-Mo4-Sn2-Si) p 382 A86-27278

Embrittled trailing edges of compressor blades (titanium alloy Ti6Al-4V and Ti6Al2Sn4Zr2Mo) of gas turbine aero-engines p 376 A86-27279

The fretting fatigue behaviour of the titanium alloy Ti-6Al-4V p 376 A86-27370

Fretting fatigue testing with a fretting bridge equipment Stress analysis, amplitudes of slip, reliability p 383 A86-27371

High temperature fatigue behavior of IMI 685 p 376 A86-27385

Semi-empirical simulation of steady and unsteady rotor blade aerodynamic loading p 336 A86-27656

Structural dynamic aspects of rotor antiresonant isolation p 353 A86-27663

Flight Test Instrumentation System FTIS for type-certification of the Indonesian aircraft CN 235 p 358 A86-27818

A procedure for the evaluation and analysis of the operational practicability and effectiveness of automated traffic flow control procedures for the near terminal area p 347 A86-27829

Production-theoretical study of air traffic output production p 402 A86-27834

The use of microcomputers in inertial navigation systems with strapdown sensors and for measurement systems of average accuracy p 347 A86-27849

Flight mechanics contributions to the time-based trajectory control in the aircraft longitudinal plane p 348 A86-27852

Synthetic lubricants and working fluids; International Colloquium, 4th, Esslingen, West Germany, January 10-12, 1984, Reports p 378 A86-28096

Concept and performance analysis of a strapdown northfinder p 349 A86-28361

Steady and unsteady transonic pressure distributions on NACA 0012 p 337 A86-28565

Numerical methods in fluid dynamics p 388 A86-29471

Wind shear measurement on board a Morane 893 p 394 N86-21084

Propulsion and control propellers with thruster nozzles primarily for aircraft applications [NASA-TM-77715] p 342 N86-21511

Algorithms for the automatic four-dimensional guidance of aircraft, taking into account the current wind situation [ESA-TT-908] p 352 N86-21531

Vertically operating flight vehicle for drilling and agricultural use [NASA-TM-77713] p 357 N86-21535

Theoretical and experimental investigations of flow vector measurements with angle-of-attack and sideslip sensors on DFVLR meteorological research aircraft [DFVLR-FB-85-50] p 358 N86-21541

A contribution to the digital compensation of periodic disturbances with frequencies in bounded intervals [DFVLR-FB-85-55] p 370 N86-21553

The icing research aircraft DO28, D-IFMP of DFVLR, and its measuring equipment [DFVLR-MITT-85-12] p 394 N86-22064

Activities report of the aerospace industry in West Germany [ISSN-0176-5086] p 403 N86-22450

## I

**INDIA**

Design considerations for Doppler VOR ground station antenna arrangement p 349 A86-28360

Jet plume temperature effects on afterbody pressure distribution and drag [NAL-TM-FM-8502] p 340 N86-20354

Side force characteristics of a 20 deg cone at high angles of attack [NAL-TM-AE-8503] p 340 N86-20356

Modal analysis of a typical fighter aircraft using transient testing technique [NAL-TM-ST-8517] p 356 N86-20385

Parametric Bi cubic surface patch for computer aided geometric design of aircraft and/or other three-dimensional geometries [NAL-TM-AE-8505] p 399 N86-21168

Computation of transfer function matrices [NAL-TM-SE-8509] p 399 N86-21232

A preliminary note on the development of a three dimensional potential code in Cartesian Coordinates [NAL-TM-AE-8504] p 399 N86-21233

**ISRAEL**

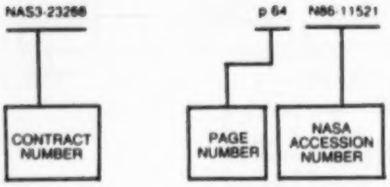
A programme of research into the aerodynamics, stability and control characteristics of a combat aircraft having a forward swept wing p 357 N86-21533
An experimental appraisal of the use of ground-plane microphones for aircraft noise measurement
[NPL-AC-104] p 401 N86-22302

# CONTRACT NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 202)* JULY 1986

### Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

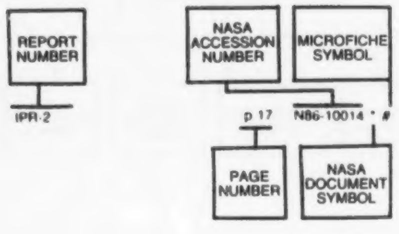
# REPORT NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 202)* JULY 1986

**Typical Report Number Index Listing**



Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

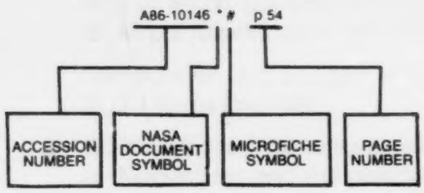
# ACCESSION NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 202)* JULY 1986

### Typical Accession Number Index Listing



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A86-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for *IAA* source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N86-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts.* Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA.

## PUBLIC COLLECTIONS OF NASA DOCUMENTS

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

### FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

## STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-914100 at the price of $7.00 domestic and $14.00 foreign—includes annual index. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 449 reports, journal articles, and other documents originally announced in June 1986 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

# TABLE OF CONTENTS

Page

**Category 01 Aeronautics (General)** 405

**Category 02 Aerodynamics** 408

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**Category 03 Air Transportation and Safety** 418

Includes passenger and cargo air transport operations; and aircraft accidents.

**Category 04 Aircraft Communications and Navigation** 421

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**Category 05 Aircraft Design, Testing and Performance** 425

Includes aircraft simulation technology.

**Category 06 Aircraft Instrumentation** 438

Includes cockpit and cabin display devices; and flight instruments.

**Category 07 Aircraft Propulsion and Power** 440

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

**Category 08 Aircraft Stability and Control** 442

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**Category 09 Research and Support Facilities (Air)** 446

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

**Category 10 Astronautics** 449

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

**Category 11 Chemistry and Materials** 449

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

**Category 12 Engineering** 453
Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

**Category 13 Geosciences** 461
Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

**Category 14 Life Sciences** 463
Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

**Category 15 Mathematics and Computer Sciences** 464
Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

**Category 16 Physics** 467
Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

**Category 17 Social Sciences** 470
Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

**Category 18 Space Sciences** N.A.
Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.

COSATI CODE → CSCL 01C

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated.

## TYPICAL JOURNAL ARTICLE CITATION AND ABSTRACT

NASA SPONSORED
ON MICROFICHE

ACCESSION NUMBER → **A86-11041*#** National Aeronautics and Space Administration.
Langley Research Center, Hampton, Va.
**AERODYNAMIC DESIGN CONSIDERATIONS FOR EFFICIENT HIGH-LIFT SUPERSONIC WINGS** ← TITLE
AUTHOR → D. S. MILLER and R. M. WOOD (NASA, Langley Research Center, Hampton, VA) ← AUTHOR'S AFFILIATION
CONFERENCE TITLE → AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs ← CONFERENCE DATE
(AIAA PAPER 85-4076)

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows.

## AERONAUTICS (GENERAL)

**A86-29868#**
**THE HISTORY OF INSTRUMENT FLIGHT**
W. R. ERCOLINE (USAF, Instrument Flight Center, Randolph AFB, TX) IN: Symposium on Aviation Psychology, 3rd, Columbus, OH, April 22-25, 1985, Proceedings . Columbus, OH, Ohio State University, 1985, p. 167-173.

It is pointed out that the first instrument ever used on an aircraft was invented by Wilbur and Orville Wright, and consisted of a piece of string placed in the air stream directly in front of the pilot. Gradually, it was realized that a pilot's equilibrium does not depend on the semicircular canals of the inner ear and the muscular sense, but on the visual sense. This development led to the invention of the 'Vertigo Stopper Box' by Ocker, and to the publication of the book 'Blind Flight in Theory and Practice', coauthored by Ocker and Crane in 1932. Another advance due to Crane was the first instrument simulator with ratio guidance features for instrument flight training applications. In tests conducted in 1930, it was found that Crane's flight integrator made it possible to eliminate vertigo, while the first blind landing was performed by Doolittle in 1929. Attention is also given to the evolution of the USAF Instrument Flight Center, and the possible advantages of the Crane Flitegage. G.R.

**A86-30549**
**HELICOPTER MAINTENANCE IN THE REAL WORLD**
G. R. VANSLYKE (Okanagan Helicopters, Ltd., Richmond, Canada) Vertiflite (ISSN 0042-4455), vol. 32, Mar.-Apr. 1986, p. 24-28.

The need to minimize helicopter operating and maintenance costs and improve reliability and durability is examined. It is estimated that large current generation helicopters cost $1,000/flying hour; the largest cost is engine repair followed by accessory repair. The improvements required in field maintenance, repair shop maintenance, and helicopter and engine design and developments are described. The use of in-house repair services and overhaul capabilities has reduced maintenance costs. The elimination of helicopter design problems such as vibrations, corrosion, water leaking, and the removal of finite-lifted components, by the manufacturer is studied. I.F.

**A86-31038**
**WHAT TECHNOLOGIES AWAIT THE FUTURE AIRLINER?**
P. CONDOM and M. LAMBERT Interavia (ISSN 0020-5168), vol. 41, Feb. 1986, p. 145-149.

The present assessment of technology readiness in the fields of airliner aerodynamics, structures, avionics, control systems, and propulsion, attempts to forecast the likely character of the next generation in commercial aircraft design. Although both political and commercial pressures exist for renewed efforts toward a second-generation SST, current technology development efforts are centered on continued refinement of laminar aerodynamics, propfan and unducted fan propulsion, thermoplastic matrix composites and aluminum-lithium alloys for structures and digital avionics and control. Attention is given to the boundary layer wing-skin suction flow laminarization technique and the competition between engine manufacturer's innovative propfan technologies. O.C.

**A86-31330#**
**X-AIRCRAFT FOR WORLD LEADERSHIP IN AERONAUTICS**
R. S. COOPER Aerospace America (ISSN 0740-722X), vol. 24, Feb. 1986, p. 26-28.

Continuing vigorous and sufficiently funded aeronautical research involving experimental aircraft is a necessity if the U.S. is to retain world leadership in aerospace defense and industrial technologies. The most recent program, the X-29, illustrates the process of demonstrating a proof of concept as a key effort in introducing new ideas into operational aircraft. The alternative to flight testing experimental demonstrator aircraft can be several years of studies in wind tunnels and in computer time, substantially increasing program costs and usually producing only an incremental increase in performance instead of an integer multiplicative advance. The next likely demonstrator program will be the DARPA-NASA X-wing circulation control (CC) rotor aircraft. CC experiments will examine techniques for generating lift, providing distributed propulsion and controlling drag, concepts which may eventually be applied in long-endurance high altitude atmospheric aircraft that may replace geosynchronous satellites. A subsequent program to develop a hydrogen-fueled aerospaceplane powered by a supersonic-combustion ramjet propulsion system may encounter funding obstacles when the time comes to construct a demonstrator experimental aircraft near the end of the 1980s. M.S.K.

**A86-31340#**
**HOW SWEDEN DECIDED TO BUILD THE GRIPEN**
S.-O. HOEKBORG (Forsvaret Materielverk, Stockholm, Sweden) Aerospace America (ISSN 0740-722X), vol. 24, March 1986, p. 48-50.

The Swedish aerospace defense industry was initiated in the 1940s after foreign manufacturers failed to make deliveries. The series of aircraft that followed included the J-29 Flying Barrel, first operational in 1951, followed by the 32-Lansen, the J-35 Draken (early delta-wing configuration), and the 37 Viggen. Budgetary constraints starting in the 1970s increased the need for a multirole fighter such as the F-16. When the Swedish government began considering foreign fighters such as the F-16 and Mirage 2000, a consortium of Swedish aerospace firms was formed, which developed a proposal for the JAS-39 Gripen. The design was accepted by the Swedish government as the Swedish multirole fighter into the 21st century. It is noted that the prospects of keeping the aerospace employment levels high in Sweden was an influential factor in the decision. M.S.K.

**EXPERT SYSTEMS IN THE FIGHTER OF THE 1990S**
R. M. YANNONE (General Electric Co., Aerospace Electronic Systems Dept., Utica, NY) IEEE Aerospace and Electronic Systems Magazine (ISSN 0885-8985), vol. 1, Feb. 1986, p. 12-16.

The development of a multibeam system for the Advanced Tactical Fighter based on mission requirements is examined. The multisensor data fusion and situation assessment expert systems are described. The fusion sensor operates over a region of the surveillance volume asynchronously and provides data to maximize target identification and kinematic state vector accuracy. The measurement set level, track file level, and onboard common aperture arrangements for the fusion system are discussed. A block diagram for processing the autonomous sensor track files is provided. The situation assessment control sensor utilizes real-time sensor and historical data to provide display parameters for the pilots, weapon cueing, countermeasure response management, and data collection direction. A table listing the subprocesses of the two expert systems is presented. I.F.

**COMBINED TEST FORCE OPERATIONS AT THE AIR FORCE FLIGHT TEST CENTER**

P. D. KENNEDY (USAF, Flight Test Center, Edwards AFB, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 10 p.
(AIAA PAPER 86-9739)

In the interest of time and cost reductions, all major aircraft acquisitions by the U.S. Air Force have since 1972 undergone combined Development Test and Evaluation/Operational Test and Evaluation. The Combined Test Force (CTF) manages the planning and execution of such programs. All support resources are gathered at a single test location, and data are furnished to all participants from a common data base. Attention is presently given to the advantages and disadvantages of the CTF approach; the principal advantages include earlier military participation and total Air Force involvement. O.C.

**PRINCIPAL SITE TESTING CONCEPT WITHIN THE NAVY**

J. L. DUNN (U.S. Naval Air Test Center, Patuxent River, MD) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, amd SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 4 p.
(AIAA PAPER 86-9740)

The U.S. Naval Air Test Center began Full Scale Development of the F-18 in 1975 with the goal of eliminating the duplication in facilities, logistics, and test data that previous test programs, involving both Navy and contractor facilities, had generated. The principal site concept employed in the Test Center colocated all test assets, which encompassed developmental aircraft, contractor and Navy test personnel, maintenance personnel, and all unique test equipment. Success with the F-18 led to similar programs for the AV 8B and LAMPS MK III aircraft. O.C.

**PRINCIPLES OF FLIGHT TEST**

J. R. LARGENT (California, University, Los Angeles) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 8 p.
(AIAA PAPER 86-9742)

This paper discusses a major shortcoming of the conduct of flight test, identifies factors which may aggravate this shortcoming, and proposes a solution. The key to success for this solution is the proper understanding and application of the principles of flight test. Although this paper is based on a lecture given as a part of a continuing education course on Avionics Systems Engineering, the principles described in this paper are generic in nature and are applicable to any system. This paper also describes some methods for applying these principles and identifies some potential pitfalls. Author

**LONG RANGE PLANNING FOR FLIGHT TEST SUPPORT**

C. R. HOPPING (USAF, Flight Test Center, Edwards AFB, CA), R. L. COUNTS, and T. A. SCANLAN (BDM Corp., Edwards AFB, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 7 p.
(AIAA PAPER 86-9744)

The U.S. Air Force Flight Test Center has initiated a program for the modernization and improvement of both the Edwards Flight Test Range and the Utah Test and Training Range. Future technical facility requirements have been identified and master planning methods to meet those requirements have been formulated. The goal of these activities is to project requirements, capabilities, funding, procurement actions, and construction programs sufficiently far in advance to ensure adequate support for near future flight test support needs. O.C.

**A86-32094#**

**OPERATIONAL SUITABILITY EVALUATION OF A TACTICAL FIGHTER SYSTEM**

A. C. DEMENT and R. D. HARTMAN (USAF, Operational Test and Evaluation Center, Kirtland AFB, NM) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 5 p.
(AIAA PAPER 86-9753)

A tactical fighter is presently evaluated by the U.S. Air Force's Operational Test and Evaluation Center (AFOTEC) methodology. AFOTEC develops a test plan and a separate data management plan to support the suitability evaluation. After data have been gathered by the AFOTEC test team, a Joint Reliability and Maintainability Evaluation Team categorizes failure data that AFOTEC can employ as a data base for analysis. After the system's current status is assessed, a projection of system maturity is made on the basis of techniques in Military Handbook 189, 'Reliability Growth Management'. Mature reliability projections, maintenance task times, and the planned logistics support structure are inputs to the availability analysis; this uses computer simulations developed or modified in-house. O.C.

**AIAA-86-9827 F-16 RADAR FLIGHT TEST A LESSON IN SOFTWARE DEVELOPMENT**

J. KELLEY (USAF, Flight Test Center, Edwards AFB, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 5 p.
(AIAA PAPER 86-9827)

The effects of software development on flight testing of aircraft equipment are investigated. Problems which have evolved in developing software are reviewed. The need for ground testing and two phase flight testing (software and specification compliance) of aircraft components is examined. The relationship between the government and contractors concerning software delivery schedules is discussed. An example decribing the flight testing problems encountered in the software development of the AN/APG-68 Fire Control Radar is provided. I.F.

**INTERNATIONAL SYMPOSIUM ON AEROELASTICITY AND STRUCTURAL DYNAMICS, 2ND, RHEINISCH-WESTFAELISCHE TECHNISCHE HOCHSCHULE, AACHEN, WEST GERMANY, APRIL 1-3, 1985, COLLECTED PAPERS**

Symposium organized by DGLR; Supported by BMFT. Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, 713 p. For individual items see A86-33227 to A86-33261, A86-33263 to A86-33291.
(DGLR BERICHT 85-02)

The present conference considers topics in the unsteady aerodynamics and aeroelastic characteristics of aircraft structures, active structural control technologies, structural modeling and optimization methods, structural system identification, and the structural dynamics design verification of space structures. Specific attention is given to the transonic equivalent strip method for aeroelastic applications, transonic unsteady methods for the calculation of flutter airloads, experimental and analytical buffeting investigations of a delta wing, the application of unsteady wing collocation methods to subsonic flow cascades, a static aeroelastic analysis employing aircraft vibration modes, and a general theory for the finite state modeling of aeroelastic systems for active control applications. Also discussed are the use of control law synthesis for gust load alleviation using linear quadratic Gaussian theory, the stiffness control of large space structures, the variation of isotropic behavior in structural optimization, the dynamic analysis of structures with flexible rotors, modal parameter estimation from driven-base tests, rapid vibration mode analysis of aircraft with external stores, and low frequency design verification of large spacecraft structures. O.C.

Avail: NTIS HC A03/MF A01

The automatic test system used to test the Tornado aircraft is described. Each piece of test equipment is dedicated to a single technological class, defined on the basis of the frequency range at which it operates, from low frequency to microwave. Avionics is conceived as a set of line replacable units tested at self standing test stations including a controller, switching devices, input-output interfaces, and appropriate instrumental configuration (dedicated or common) which carry out the test under the test control program. The interface with the operator is a video display unit. As an example of system performance, the flight computer control time is reduced to one tenth of the normal time required.

**FUZZY INFERENCE SYSTEM TO DIAGNOSE AIRCRAFT HYDRAULIC FAULTS**
S. FENG, W. WENG, and L. DONG *In its* China Report: Science and Technology (JPRS-CST-86-010) p 134-141 19 Mar. 1986 refs Transl. into ENGLISH from Shuxue de Shijian yu Renshi (Beijing, China), no. 3, Jul. 1985 p 14-18
Avail: NTIS HC A08/MF A01

Aircraft hydraulic systems, the drive systems which control attitude, extension and retraction of landing gear, and wing flaps, are composed of tens to over a hundred parts. These systems are complex and often give rise to puzzling faults. The application of computers in fault diagnosis can increase precision and speed so as to conveniently array the prerequisites which create the fault. This is one effective way to improve the quality of aircraft maintenance. The causes of system faults and the appearance of symptoms have a random or Fuzzy nature. In the process of diagnosis the language people use is also largely vague. Based on these statistics combined with fault mechanism analysis, this article takes natural languages and transforms it into machine language and crystallize human experience to simulate a Fuzzy inference system. The characteristic nature of the system is first to select from events a set of symptoms (input) and causes (output) of model fault events and store them in a computer. Then during diagnosis an input works in this system to diagnose the causes (output). B.W.

**AN AERODYNAMIC ANALYSIS COMPUTER PROGRAM AND DESIGN NOTES FOR LOW SPEED WING FLAP SYSTEMS Final Report**
H. W. CARLSON and K. B. WALKLEY Washington NASA Mar. 1983 75 p refs
(Contract NAS1-16000)
(NASA-CR-3675; NAS 1.26:3675) Avail: NTIS HC A04/MF A01 CSCL 01B

The expanded capabilities for analysis and design of low speed flap systems afforded by recent modifications of an existing computer program is described. The program provides for the simultaneous analysis of up to 25 pairs of leading-edge and trailing-edge flap deflection schedules. Among other new features of the program are a revised attainable thrust estimation method to provide more accurate predictions for low Mach numbers, and a choice of three options for estimation of leading-edge separation vortex flow effects. Comparison of program results with low speed experimental data for an arrow wing supersonic cruise configuration with leading-edge and trailing-edge flaps showed good agreement over most of the range of flap deflections. Other force data comparisons and an independent study of airfoil and wing pressure distributions indicated that wind-tunnel measurements of the aerodynamic performance of twisted and cambered wings and wings with leading-edge flaps can be very sensitive to Reynolds number effects. A review is presented of some of the lessons learned from wind tunnel tests since World War II. Wind tunnels achieved a very high productivity rate during the war due in part to development testing of numerous military aircraft concepts. Following the war, in addition to development testing, a rapid increase in basic research testing occurred in order to explore areas of interest revealed by the conduct of war and to expand on advanced technology that became available from Germany and Italy. The research test areas discussed are those primarily related to the transition from subsonic flight to supersonic flight. Author

**DEPOT MAINTENANCE OF AVIATION COMPONENTS: CONTRACTOR VERSUS ORGANIC REPAIR**
L. B. EMBRY, N. Y. MOORE, J. CAVE, and F. LABRUNE Mar. 1985 116 p
(Contract N00014-83-C-0100)
(AD-A162071; RAND/N-2225-NAVY) Avail: NTIS HC A06/MF A01 CSCL 01C

Aviation and engine component repair requirements make up over half of the projected wartime depot-level maintenance workload. Organic (service-owned) ability to support this workload is particularly limited; at present, nearly half of the Navy's depot-level component repair is performed in contractor or other service facilities. Before major investments are made in the facilities and equipment needed to accomplish these repairs, it will be necessary to determine the appropriate mix of organic and contractor repair sources. This note addresses the economic and operational implications of alternative source-of-repair decisions. Based on analyses of the distribution of projected wartime demands, technical data limitations, the structure of the repair industry, the operational payoff of facilities characterized by broad scope of repair, and airline industry practices, it postulates a strategy for providing depot-level component support that can be used to specify the appropriate source of repair at different points in the weapon system and subsystem life cycle. **RECOMBINATION OF VORTEX FILAMENTS AND ITS ROLE IN AERODYNAMIC NOISE**
R. TAKAKI (Tokyo University of Agriculture and Technology, Fuchu, Japan) and A. K. M. F. HUSSAIN (Houston, University, TX) IN: Symposium on Turbulent Shear Flows, 5th, Ithaca, NY, August 7-9, 1985, Proceedings . University Park, PA, Pennsylvania State University, 1985, p. 3.19-3.25. refs
(Contract NSF MEA-81-11676; NSF INT-84-14714)

The recombination of two vortex filaments in a viscous incompressible fluid is analyzed by the use of the vorticity equation. The analysis is confined to a local flow field where the recombination process occurs, and is based on several assumptions, such as conservation of the fluid impulse, spatial symmetry of the flow field, etc. The flow field is expanded as polynomials of coordinates, and variations of their coefficients are obtained by the use of the vorticity equation. It is proved that the process is completed within a short time of 0(sigma-squared/Gamma), and that the viscous effect is essential; sigma and Gamma are the size and the circulation of the filaments, respectively. The result is applied to predict the far-field noise of a circular jet by assuming that the main noise source is the recombination process in deformed vortex rings in the jet near field. The predicted noise intensity shows the U to the 8th dependence and has an additional new factor (d/sigma) to the 6th; U is the jet velocity and d is the average spacing between vortex rings. The predicted intensity distribution is directional even without the effect of source convection. Author

**A METHOD FOR COMPUTER AIDED DESIGN OF TRANSONIC TURBINE CASCADE**

Y. AHAO, T. ZHAN, H. XIAO, J. ZHENG, and Z. WU (Nanhua Power Plant Reseach Institute, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Oct. 1985, p. 449-454. In Chinese, with abstract in English.

A computer-aided design method for transonic turbine aerofoil shaping and thermodynamic analysis is presented. The method adopts the technique of 'Computational Geometry' developed for blade space shaping. An improved Streamline Curvature method for cascade analysis, called CASC, is applied to blade-to-blade stream surface analysis. Its advantage over the conventional streamline curvature method lies in using oblique computational stations. On the basis of choosing the throat as a basic computational station, all oblique computational stations are generated from input data by circular spline fitting and interpolating. A high-loaded turbine cascade with anti-convex suction surface near the trailing edge has been designed with success by this method. Its appreciable supersonic performance is proven in wind tunnel tests. This method is a core module of a 'Turbine Blade Computer Aided Design System' (GTCAD). Author

**A CORRECTION OF THE ANGLE OF INCIDENCE FOR A TWO-DIMENSIONAL WING MODEL IN THE CLOSED TEST SECTION**

K. ABE Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 383, 1985, p. 689-696. In Japanese, with abstract in English. refs

In low-speed wind tunnel testing for a two-dimensional wing model, a correction to the angle of incidence is considered due to the nonuniform spanwise distribution of lift. This phenomenon is concerned with the change of the effective angle of incidence, which results from the interference between the wing tip and tunnel wall perpendicular to the wing span. Since the change of the effective angle of incidence is connected with the induced drag according to the lifting-line wing theory, the change of the effective angle of incidence may be estimated if the induced drag could be determined by experiment. In this study, the induced drag is obtained by the difference between the total drag measured by the wind tunnel balance and the profile drag determined by the wake measurements. The result with this correction to the angle of incidence is in good agreement with reliable experimental data. Author

**OUTER SURFACE OF AIRPLANE AND COMPUTATIONAL GRID FOR FLOW ANALYSIS IN PHYSICAL SPACE**

M. NAKAMURA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 383, 1985, p. 704-709. In Japanese, with abstract in English.

For the purpose of numerical analysis of three-dimensional compressible steady flow around an airplane, it is necessary to find quantitatively local positions of an outer surface of the airplane and local directions of the surface in a rectangular computational grid system in physical space. The outer surface of the airplane is made up of many elements of small triangular planes. The local positions of the outer surface in the grid system are determined by local interactions of axes of the grid with these triangular planes. Directions of the triangular planes are substituted for the local directions of the outer surfaces. Using these results, views of the outer surface of airplane are drawn in sheets of paper. Author

**A86-31132**

**ON THE EXACT SOLUTION OF THE LINEARIZED LIFTING-SURFACE PROBLEM OF AN ELLIPTIC WING**

A. HAUPTMAN and T. MILOH (Tel Aviv University, Israel) Quarterly Journal of Mechanics and Applied Mathematics (ISSN 0033-5614), vol. 39, Feb. 1986, p. 41-66. refs

An analytic solution is presented for the lifting-surface problem of a thin circular or elliptic wing in steady incompressible potential flow. The analysis is based on expansion of the acceleration potential in an infinite series of ellipsoidal harmonics. Unlike previous analyses, which involve inversion of infinite sets of linear equations or the numerical solution of integral equations, the present method leads to rather simple explicit expressions for the lift and moment coefficients in terms of the aspect ratio. These expressions are valid in the whole range of aspect ratios from the two-dimensional airfoil through the circular wing to the slender wing. Author

**A86-32154#**

**UNSTEADY STALL MODELLING IN THREE-DIMENSIONAL FLOW**

C. COSTES, J. J. COSTES, and D. PETOT (ONERA, Chatillon-sous-Bagneux, France) La Recherche Aerospatiale (English Edition) (ISSN 0379-380X), no. 4, 1985, p. 59-61. refs

A two-dimensional model that determines aerodynamic forces using nonlinear coupled differential equations is presented. The model expresses nonlinear and three-dimensional effects. The application of the model to the evaluation of unsteady aerodynamic forces on a straight rectangular wing model is described; data for large-amplitude oscillations at zero sweep are obtained. Experimental and theoretical data are compared and good correlation is observed. I.F.

**AIRCRAFT AND ROCKETS: DESIGN CONCEPTS [AVIOANE SI RACHETE: CONCEPTE DE PROIECTARE]**

M. M. NIA, F. V. MORARU, and R. N. PATRAULEA Bucharest, Editura Militara, 1985, 303 p. In Romanian. refs

After a brief historical review of the Romanian aviation, the book details design concepts and principles of aircraft and rocket construction and aerodynamics. Topics discussed include wing geometry and profiles (NACA, ONERA, Tsagi, RAF), aileron and flap theory, and fuselage construction; also discussed are aerodynamics of the tail ensemble and lift and drag problems. Rocket subjects include supersonic flight regimes, ballistic laws and trajectory and reentry theories. Angle-of-attack and angle-of-incidence computations are presented, together with theories and problems of the propeller and jet propulsion systems. The book is recommended for academic as well as military circles. N.D.

**FLOW STRUCTURE AT THE WINDWARD SIDE OF CONICAL WINGS WITH AN ATTACHED SHOCK WAVE AT THE LEADING EDGE [O STRUKTURE TECHENIIA OKOLO NAVETRENNOI STORONY V-OBRAZNYKH KRYL'EV S PRISOEDINENNOI UDARNOI VOLNOI NA PEREDNIKH KROMKAKH]**

M. A. ZUBIN and N. A. OSTAPENKO Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), Jan.-Feb. 1986, p. 122-131. In Russian. refs

Results of numerical calculations of symmetric supersonic flow of a gas past the windward side of conical wings with a dihedral angle of 40 deg and apex angles of 30, 45, and 90 deg are presented for Mach 3. The fact that one or two Ferri points may move up from the corner point of the wing profile is discovered and explained. It is shown that conical flow past wings of finite length may discontinue at regimes corresponding to angles of attack at which the Ferri point moves up. V.L.

**EXPERIMENTAL AND THEORETICAL STUDY OF WINGS WITH BLUNT TRAILING EDGES**

V. RAMJEE, E. G. TULAPURKARA, and V. BALABASKARAN (Indian Institute of Technology, Madras, India) Journal of Aircraft (ISSN 0021-8669), vol. 23, April 1986, p. 349-352. refs

The effects of blunt trailing edges on the performance of an aircraft are experimentally and theoretically evaluated. A teak wood model with sharp trailing-edged wings and a chord of 0.2 m, and four models with blunt trailing edges and chords of 0.19, 0.18, 0.17, and 0.16 m are tested at the speed of 32 m/s. The lift coefficient, wing drag, slope of the lift curve, and aerodynamic efficiency are examined. The data reveal that for a slightly blunt trailing edge there is no significant affect on aerodynamic characteristics; however, when the bluntness increased the slope of the lift curve, the maximum lift coefficient, and drag coefficient increase and the aerodynamic efficiency decreases. The simplified Martensen surface vorticity technique of Lewis (1980) is used to calculate potential flow past airfoils with blunt trailing edges. It is observed that the slope of the lift curve increases from 0.1195 to 0.138 when the cutoff is increased from 0-50 percent of the chord. I.F.

**AERODYNAMIC CHARACTERISTICS OF A FLEXIBLE MEMBRANE WING**

S. GREENHALGH (U.S. Navy, Naval Air Development Center, Warminster, PA) and H. C. CURTISS, JR. (Princeton University, NJ) AIAA Journal (ISSN 0001-1452), vol. 24, April 1986, p. 545-551. refs

(AIAA PAPER 84-2168)

The results of experimental studies of the aerodynamic characteristics of single-surface membrane wings constructed of inextensible flexible material are described and compared with theory. The experiments included measurement of the lift and drag characteristics of semispan wing models of three different planforms (triangular, parabolic, and elliptical). The wing surfaces were constructed of 2- and 4-mil stainless steel shim stock attached to a streamline leading-edge spar. This very thin metal membrane is flexible and adjusts its shape in response to the airflow over the wing surface. The experimental apparatus permitted variation of the camber and twist distribution of the wing. A unique method of describing the geometry of the wing is presented and used to correlate the experimental results and to compare experiment with theory. The experimental results agree well with lifting line theory below stall using the method presented for determining the geometric shape of the wing. The wing with the parabolic planform exhibited the best aerodynamic characteristics compared to the triangular and elliptical planforms. The maximum lift coefficients and lift-to-drag ratios measured are comparable to conventional rigid wings. Various dynamic phenomena encountered during the experiments are described. Author

**DYNAMIC STALL INCEPTION CORRELATION FOR AIRFOILS UNDERGOING CONSTANT PITCH RATE MOTIONS**

J. H. STRICKLAND and G. M. GRAHAM (Texas Tech University, Lubbock) AIAA Journal (ISSN 0001-1452), vol. 24, April 1986, p. 678-680. Research supported by the Sandia National Laboratories. refs

(Contract F49620-82-C-0035)

Most of the experimental data obtained to date for unsteady separated flow over airfoils undergoing constant pitch rate motions have been obtained from oscillating airfoils undergoing relatively small sinusoidal pitch oscillations about a relatively low mean angle of attack. Attention is presently given to two tank flow visualizations in which a NACA 0015 airfoil was mounted on a carriage that imparted translational motion as well as constant rates of pitching about the quarter-chord. Hydrogen bubbles provided the flow visualizations, which appeared to be two-dimensional in character. Separation was noted to usually occur at the leading edge, at angles-of-attack that may greatly exceed the static stall angle. O.C.

**SIMULATION OF INVISCID VORTEX-STRETCHED TURBULENT SHEAR-LAYER FLOW**

A. RIZZI (Flygtekniska Forsoksanstalten, Bromma, Sweden) and C. J. PURCELL (ETA Systems, Inc., St. Paul, MN) AIAA Journal (ISSN 0001-1452), vol. 24, April 1986, p. 680-682.

Computational simulations are conducted for a vortex flowfield that develops when a delta wing meets an oncoming stream of air at a high angle-of-attack. If the Reynolds number of the flow is of the order of 10 million or larger, the shear stresses and dissipation terms take effect only in very thin layers of the flow on the surface of the wing and across the shear layers that separate from the leading and training edges. Attention is given to the dynamics and the stability of these free shear layers by means of numerical simulations that solve Euler equations with an artificial viscosity model. The flow is inviscid except across thin discontinuities like shock waves and vortex sheets. O.C.

**MACH REFLECTION AND AERODYNAMIC CHOKING IN TWO-DIMENSIONAL DUCTED FLOW**

A. KUMAR (NASA, Langley Research Center, Hampton, VA) AIAA Journal (ISSN 0001-1452), vol. 24, April 1986, p. 695-697.

Flow through a two-dimensional duct with supersonic inflow is numerically investigated, from the viewpoint of the formation of Mach reflection, aerodynamic choking, and the possibility of constructing a curve similar to that for the quasi-one-dimensional flow in a converging-diverging duct. Such a curve can be used to determine whether a duct with a certain area ratio will or will not choke for a given inflow Mach number. Plots of pressure and mass flux contours are obtained for a given duct configuration. It is found that the two-dimensional flow always chokes at a higher Mach number than the corresponding quasi-one-dimensional flow for a given throat/inlet flow area ratio. O.C.

**AIRFOIL DESIGN AT SONIC VELOCITY**

B. LING (Nanchang Aircraft Co., People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 4, March 1986, p. 1-10. In Chinese, with abstract in English. refs

A numerical finite difference method for calculating a hodograph solution at free-stream Mach number 1 is described. The exact hodograph formulation is used in the calculation. Because of the singularity of the far field boundary condition in the physical plane, which is mapped to a singular point on the hodograph plane, the approximate analytical solution of the Tricomi equation is employed. The boundary curves of five examples for the numerical calculations in the hodograph plane are described by the spline method. A family of airfoil shapes and their pressure distribution, drag, lift, and moment about the leading edge are presented. These sonic airfoil designs may be useful for assessing the near sonic aircraft performance. Author

**THE PASSIVE CONTROL OF THE SHOCK WAVES ON TRANSONIC AIRFOILS**

G. SAVU (Aviation Institute, Bucharest, Rumania) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 4, March 1986, p. 11-18. refs

A method for the attenuation of shock waves on airfoils in supercritical flow is presented. By numerically solving the inviscid, small disturbance equation in steady transonic regime, with boundary conditions on solid or porous airfoils, the corresponding pressure distribution is obtained. Comparing the pressure distribution in both cases, one may observe that for the porous airfoils a gradually recompression towards the trailing edge is occuring, without strong shock waves, in a quite large Mach number domain, in opposition to the known fact that supercritical airfoil optimization is valid only in a very close vicinity of the design Mach number and incidence. For a given Mach number and incidence, the calculated pressure distribution on the airfoil having porous regions, is used to generate the contour of an equivalent solid airfoil whose shape resembles that of an supercritical airfoil. Author

**AN IMPROVEMENT TO THE NUMERICAL METHOD FOR CALCULATIONS OF AIRCRAFT CONFIGURATION LONGITUDINAL AERODYNAMIC CHARACTERISTICS**

Z. JIANG (China Aerodynamic Research and Development Center, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 4, March 1986, p. 56-64. In Chinese, with abstract in English. refs

Based on the subsonic and supersonic potential theory, an improved numerical method is developed for the calculation of the surface pressure distribution on an aircraft and then the force and moment by integrating the pressure distributions, using surface distribution finite element solutions. With concepts of joint flow field and the effective section thrust and strip turbulent boundary layer theory, an improved drag calculation can be obtained. A computer program has been developed. Several examples of calculated aerodynamic characteristics are presented, and good agreement between calculation results and experimental data can be achieved. Author

### TRANSONIC EQUIVALENT STRIP METHOD FOR AEROELASTIC APPLICATIONS

D. D. LIU, Y. F. KAO (Arizona State University, Tempe), and K. Y. FUNG (Arizona, University, Tucson) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 17-32. Navy-supported research. refs

As an engineering tool for aeroelastic applications, the present Transonic Equivalent Strip (TES) method has established an efficient and cost-effective procedure for unsteady flow computations of arbitrary wing planforms including control surfaces. According to the nature of three-dimensional unsteady transonic flow, a method based on the TES model is developed which consists of two consecutive correction steps to a given unsteady two-dimensional code. The latter could be a time-linearized transonic code or a nonlinear one such as LTRAN2 code. First, the mean-flow correction step which involves an equivalent airfoil design procedure; second, the spanwise phase correction step which accounts for the effects of acoustic wave propagation in three dimensions. Computed results using the TES method are compared with those obtained by the current methods such as various versions of XTRAN3 code, Isogai's full potential code and measured data provided by NLR and by RAE. Computed cases include the Northrop F-5 wing in pitching oscillation, the AGARD standard RAE wing with an oscillating flap and the LANN wing in pitching oscillation. Assessments of the present approach and other existing methods will be given. Author

### CALCULATION OF 3-D UNSTEADY TRANSONIC POTENTIAL FLOWS BY A FIELD PANEL METHOD

R. VOSS (DFVLR, Institut fuer Aeroelastik, Goettingen, West Germany) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 33-46. refs

A calculation method for 3-d transonic flows around oscillating wings is described. It solves the time-linearized unsteady transonic small perturbation equation by an integral equation method with a field panel technique. In a computer code called PTRAN3, the field panel technique is combined with a finite difference method. Accuracy and computer costs of the code are acceptable for routine flutter applications. Results are shown for applications to pitching motions of a rectangular wing and two swept wings (LANN wing and F5 wing) with high and low aspect ratio. Author

### APPLICATION OF TRANSONIC UNSTEADY METHODS FOR CALCULATION OF FLUTTER AIRLOADS

H. ZIMMERMANN and S. VOGEL (Messerschmitt-Boelkow-Blohm GmbH, Bremen, West Germany) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 47-61. refs

A supercritical airfoil profile is used as an example of the calculation of steady and unsteady pressure distributions by the application of different unsteady transonic codes; these primarily involve the nonlinear transonic small perturbation (TSP) equation and its time-linearized form, solved by time-marching as well as integral methods. The influence of the coefficient of the nonlinear term, the inclusion of the steady or quasi-steady boundary layer thickness, and the fulfilment of the Rankine-Hugoniot condition on the resulting pressure distribution, are all noted. The inclusion of the boundary layer led to a much larger shift in critical speed for the nonlinear TSP method than for its linearized version. O.C.

**A86-33231**

### EXACT CLOSED-FORM SOLUTIONS FOR NONLINEAR UNSTEADY TRANSONIC AERODYNAMICS

G. A. OYIBO (Fairchild Republic Co., Farmingdale, NY) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 71-79. refs

After establishing the existence of exact, closed form solutions for nonlinear unsteady aerodynamics, the full nonlinear unsteady velocity potential equations for an airfoil are considered and evidence for the ineffectiveness of traditional hodograph methods in solving these equations is presented. A mapping scheme is accordingly used to transform these full nonlinear equations into the hodograph plane; the resulting hodograph equations show that, by prescribing the Jacobian of the transformation ab initio, the exact closed form solutions can be obtained for the nonlinear unsteady aerodynamic characteristics of an airfoil in a potential flow. The shockless transonic results presented show trends that agree with the results of both previous investigators and the available experimental data. O.C.

### RECENT TRANSONIC UNSTEADY PRESSURE MEASUREMENTS AT THE NASA LANGLEY RESEARCH CENTER CENTER

M. C. SANDFORD, R. H. RICKETTS, and R. W. HESS (NASA, Langley Research Center, Hampton, VA) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 80-98. Previously announced in STAR as N85-23710. refs

Four semispan wing model configurations were studied in the Transonic Dynamics Tunnel (TDT). The first model had a clipped delta planform with a circular arc airfoil, the second model had a high aspect ratio planform with a supercritical airfoil, the third model has a rectangular planform with a supercritical airfoil and the fourth model had a high aspect ratio planform with a supercritical airfoil. To generate unsteady flow, the first and third models were equipped with pitch oscillation mechanisms and the first, second and fourth models were equipped with control surface oscillation mechanisms. The fourth model was similar in planform and airfoil shape to the second model, but it is the only one of the four models that has an elastic wing structure. The unsteady pressure studies of the four models are described and some typical results for each model are presented. Comparison of selected experimental data with analytical results also are included. Author

**A86-33233**

### STEADY AND UNSTEADY PRESSURE DISTRIBUTIONS ON VARIOUS PROFILES IN SEPARATED SUBSONIC AND TRANSONIC FLOW

H. TRIEBSTEIN (DFVLR, Institut fuer Aeroelastik, Goettingen, West Germany) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 99-119. refs

Steady and unsteady aerodynamic data are obtained for three rectangular wings in two-dimensional flow. Low subsonic speed wind tunnel measurements were made on a wing with oscillating spoiler in pitch about its leading edge, where the airfoil profile was a supercritical MBB-Va2, while the high subsonic and transonic measurements were performed on pitching airfoils about the c/4-axis of both supercritical MBB-A3 and NACA 0012 profiles. The measurements were performed in order to arrive at systematic results with respect to Mach number, reduced frequency, incidence, and oscillation amplitude; these were then to be used in the development and assessment of subsonic and transonic codes. Emphasis is given to the higher harmonic parts of the unsteady pressure in the region of pressure jumps and flow separation. O.C.

**A86-33234**

### AN IMPROVED POTENTIAL GRADIENT METHOD FOR THE CALCULATION OF UNSTEADY AERODYNAMIC PRESSURES ON OSCILLATING WINGS IN SUPERSONIC FLOW

F.-Q. ZHANG and H. FOERSCHING (DFVLR, Aerodynamische Versuchsanstalt, Goettingen, West Germany) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 153-162. refs

A new computation method is presented to calculate unsteady aerodynamic pressure on oscillating wings in supersonic flow. The main feature of this method is the introduction and application of a new integral variable substitution, by which the computer time is reduced considerably together with an improvement of computation accuracy, especially for low supersonic Mach numbers and high reduced frequencies. Comparisons with other methods and experimental results show quits satisfactory agreement. Author

**A86-33235**

### AN EXACT FORMULATION OF THE UNSTEADY AERODYNAMIC THEORY OF LIFTING SURFACES UNDERGOING ARBITRARY SMALL MOTIONS IN A SUPERSONIC FLOW FIELD

L. LIBRESCU (Tel Aviv University, Israel) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 163-168. refs

This paper deals with the development of an exact algorithm allowing determination of the unsteady pressure field on 3D lifting surfaces undergoing arbitrary small motions in a supersonic flow field. The analysis starts with the linearized field equations of isentropic, inviscid compressible aerodynamics. Linearization of the relevant field equations is performed on the basis of the small-disturbance concept. In this framework each flow variable is represented as the superposition of a primary quantity, held to be constant and corresponding to the undisturbed conditions, and of a small-disturbance, stipulated to be an arbitrary time-dependent quantity. Author

### APPLICATION OF UNSTEADY WING COLLOCATION METHODS TO CASCADES IN SUBSONIC FLOW

A. KLOSE and B. LASCHKA (Braunschweig, Technische Universitaet, Brunswick, West Germany) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 180-186. refs

The acceleration potential has been used to reformulate the integral equation relating pressure and downwash on the blades of cascades. In the present investigation harmonically oscillating blades in subsonic flow have been considered. A collocation method as used in lifting surface theories for single airfoils has been adapted to solve the cascade equation. Pressure distribution and airforces have been calculated for several values of stagger, reduced frequency, space-to-chord ratio, Mach number, and inter-blade phase angle. The results have been compared to those published in other reports and, in some cases, significant differences have been discovered. Author

### A NEW LOOK AT ARBITRARY MOTION UNSTEADY AERODYNAMICS AND ITS APPLICATION TO ROTARY-WING AEROELASTICITY

P. P. FRIEDMANN (California, University, Los Angeles) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 194-210. refs

(Contract NAG2-209)

This paper presents in a unified manner recent research on arbitrary motion unsteady aerodynamics with an emphasis on applications to a number of rotary wing aeroelastic problems. The term arbitrary motion is used to denote growing or decaying oscillations with a certain frequency. The specific topics treated in this paper are: (1) generalization of Greenberg's theory and its application to hingeless rotor aeroelastic stability; (2) description of a new technique for formulating finite state approximations to unsteady aerodynamic theories, which are suitable for both fixed-wing and rotary-wing applications, and its application to generalize Loewy's theory; (3) comparison of fixed wing and rotary-wing indicial response functions; (4) influence of a arbitrary motion aerodynamics, as represented by dynamic inflow on a helicopter in ground resonance and (5) comparison of dynamic inflow with arbitrary motion unsteady airfoil aerodynamics. From the discussion of these topics a number of useful conclusions on the fundamental nature of arbitrary motion aerodynamics and its role in rotary-wing aeroelasticity are obtained. Author

### STEADY TRANSONIC FLOW

E. DICK (Gent, Rijksuniversiteit, Ghent, Belgium) IN: Encyclopedia of fluid mechanics. Volume 1 . Houston, TX, Gulf Publishing Co., 1986, p. 510-532. refs

Steady flows in which some regions of the flow field are subsonic and other regions are supersonic are studied. Basic equations for the steady adiabatic flow of an inviscid fluid are derived, and some one-dimensional examples are treated. It is shown that a stationary compression shock can exist in a steady flow, and the relations between flow properties on both sides of the shock wave are analyzed. The flow in a convergent-divergent duct with a slowly varying S-section, such that the flow can be considered to be uniform in each section, is considered. Two-dimensional transonic flow is considered, including its general appearance, the effect of viscosity, transonic flow past an airfoil, transonic flow in cascades, and transonic shockless flow. The mathematical character of the Euler equations is analyzed, and the potential flow simplification is described. C.D.

**A86-33409**
**NUMERICAL MODELING OF TRANSONIC FLOWS OVER AIRFOILS AND CASCADES**
X.-H. ZHOU, S. L. LIU, and F.-D. FAN (Northwestern Polytechnical University, Xian, People's Republic of China) IN: Encyclopedia of fluid mechanics. Volume 1 . Houston, TX, Gulf Publishing Co., 1986, p. 533-559. refs

Numerical modeling of inviscid transonic flows around airfoils and in cascades is considered. The basic governing equations, computational mesh, discretization techniques for governing equations, boundary conditions, artificial dissipation, and methods of accelerating convergence are discussed. A time-dependent method for solving the Euler equations is stressed, discussing cascade flow computations in some detail. Some numerical results are presented to illustrate the accuracy and limitations of the numerical modeling. C.D.

**AERODYNAMICS AND MOLECULAR GAS DYNAMICS [AERODINAMIKA I MOLEKULIARNAIA GAZOVAIA DINAMIKA]**
V. V. STRUMINSKII Moscow, Izdatel'stvo Nauka, 1985, 240 p. In Russian. refs

A series of fundamental problems of practical interest in aerodynamics and molecular gasdynamics are treated using methods of the boundary layer theory and the kinetic theory of gases. Problems examined include the proof of the existence of the slip effect on rectangular wings of infinite aspect ratio and the conditions under which this effect is observed for wings with various degrees of sweep; the effect of acceleration on the structure of a boundary layer, its separation, and drag at low velocities; and the development of a nonlinear stability theory for plane laminar flows of a viscous liquid. Other problems discussed include the development of a more general method for solving Boltzmann equations and the development of a new nonequilibrium kinetic theory of gases. V.L.

**ANALYSIS OF DYNAMIC STABILITY DERIVATIVES FOR HIGH ANGLE OF ATTACK AIRCRAFT Ph.D. Thesis**
J. S. KO 1985 184 p
Avail: Univ. Microfilms Order No. DA8521331

Modern, high performance aircraft are required to be able to fly and be controlled over a wide variety of flight conditions. In order to predict the aircraft behavior and control requirements over the entire flight regime it is necessary to have a proper aerodynamic model. In this research, wind tunnel experiments are performed on an F-5 aircraft model at high angles of attack, with small oscillations about the body oriented roll axis. In addition the free stream environment can be configured in one of three ways: (1) straight uniform flow, (2) curved flow to simulated a horizontal turn, and (3) rolling flow to simulated a roll motion about the relative velocity vector. A description of the wind tunnel velocity and the recently developed roll oscillatory rig is given. In addition new linearized equations of motion are developed for describing the small roll oscillation in the non-uniform flow environment. These equations are used to reduce the data obtained in the wind tunnel experiments in order to obtain the usual combined rotary and unsteady aerodynamic stability derivatives as well as new combinations of pure rotary derivatives obtainable only with the non-uniform flow conditions. Dissert. Abstr.

**UNSTEADY AERODYNAMICS IN TIME AND FREQUENCY DOMAINS FOR FINITE-TIME ARBITRARY MOTION OF HELICOPTER ROTOR BLADES IN HOVER AND FORWARD FLIGHT Ph.D. Thesis**
M. ASGHAR-HESSARI-DINYAVARI 1985 549 p
Avail: Univ. Microfilms Order No. DA8525824

Several incompressible finite-time arbitrary-motion airfoil theories suitable for coupled flag-lag-torsional aeroelastic analysis of helicopter rotors in hover and forward flight are derived. These theories include generalized Greenberg's theory, generalized Loewy's theory, and a staggered cascade theory. The generalized Greenberg's and staggered cascade theories were derived directly in Laplace domain considering the finite length of the wake and using operational methods. The load expressions are presented in the Laplace, frequency, and time domains. Approximate time domain loads for the various generalized theories are obtained by developing finite state models using Pade approximant of the appropriate lift deficiency functions. Three different methods for constructing Pade approximants of the lift deficiency functions were considered and the more flexible one was used. In the second part of this study the influence of finite-state arbitrary-motion time-domain aerodynamics on rotor blade aeroelastic stability was illustrated for hover and forward flight conditions. Dissert. Abstr.

**FLOW PREDICTION FOR PROPFAN ENGINE INSTALLATION EFFECTS ON TRANSPORT AIRCRAFT AT TRANSONIC SPEEDS Final Report**
S. S. SAMANT and N. J. YU Washington NASA Jan. 1986 93 p refs
(Contract NAS1-17250)
(NASA-CR-3954; NAS 1.26:3954) Avail: NTIS HC A05/MF A01 CSCL 01A

An Euler-based method for aerodynamic analysis of turboprop transport aircraft at transonic speeds has been developed. In this method, inviscid Euler equations are solved over surface-fitted grids constructed about aircraft configurations. Propeller effects are simulated by specifying sources of momentum and energy on an actuator disc located in place of the propeller. A stripwise boundary layer procedure is included to account for the viscous effects. A preliminary version of an approach to embed the exhaust plume within the global Euler solution has also been developed for more accurate treatment of the exhaust flow. The resulting system of programs is capable of handling wing-body-nacelle-propeller configurations. The propeller disks may be tractors or pushers and may represent single or counterrotation propellers. Results from analyses of three test cases of interest (a wing alone, a wing-body-nacelle model, and a wing-nacelle-endplate model) are presented. A user's manual for executing the system of computer programs with formats of various input files, sample job decks, and sample input files is provided in appendices. Author

**NUMERICAL ANALYSIS OF INVISCID FLOWS ABOUT WING-FUSELAGE COMBINATIONS. PART 1: DEVELOPMENT OF GRID GENERATION CODE YOKUDO-G**
T. ISHIGURO, N. KAMIYA, and K. OGUCHI Jul. 1985 61 p refs In JAPANESE:ENGLISH summary
(NAL-TR-864; ISSN-0389-4010) Avail: NTIS HC A04/MF A01

The main purpose of this paper is to numerically analyze inviscid flows about wing-fuselage combinations. In the first series a numerical procedure is presented for grind generation about a wing-fuselage combination by the analytic mapping method. A user's manual for the FORTRAN code of the procedure is also described. Furthermore, many numerical examples are presented in order to show the utility of this code for several wing-fuselage combinations and in order to understand the role of the controllable variables which yield many patterns of mesh distributions. In the next series, numerical analysis of inviscid flows will be carried out under the grids generated by this numerical procedure. Author

**LOW-SPEED WIND-TUNNEL TESTS OF SINGLE- AND COUNTER-ROTATION PROPELLERS**

D. M. DUNHAM, G. L. GENTRY, JR., and P. L. COE, JR. Apr. 1986 46 p refs

(NASA-TM-87656; L-16077; NAS 1.15:87656) Avail: NTIS HC A03/MF A01 CSCL 01A

A low-speed (Mach 0 to 0.3) wind-tunnel investigation was conducted to determine the basic performance, force and moment characteristics, and flow-field velocities of single- and counter-rotation propellers. Compared with the eight-blade single-rotation propeller, a four- by four- (4 x 4) blade counter-rotation propeller with the same blade design produced substantially higher thrust coefficients for the same blade angles and advance ratios. The results further indicated that ingestion of the wake from a supporting pylon for a pusher configuration produced no significant change in the propeller thrust performance for either the single- or counter-rotation propellers. A two-component laser velocimeter (LV) system was used to make detailed measurements of the propeller flow fields. Results show increasing slipstream velocities with increasing blade angle and decreasing advance ratio. Flow-field measurements for the counter-rotation propeller show that the rear propeller turned the flow in the opposite direction from the front propeller and, therefore, could eliminate the swirl component of velocity, as would be expected. **EFFECTS OF SOME GEOMETRIC VARIATIONS ON MISSILE AERODYNAMIC CHARACTERISTICS AT SUPERSONIC SPEEDS**

M. L. SPEARMAN Feb. 1986 26 p refs Presented at the 24th AIAA Aerospace Sciences Meeting, Reno, Nev., 6-9 Jan. 1986 Previously announced in IAA as A86-19958

(NASA-TM-87683; NAS 1.15:87683) Avail: NTIS HC A03/MF A01 CSCL 01A

A summary of some results from tests of a wing-body general research missile model is presented for a Mach number range up to 4.63. A basic ogive-cylinder body with a length-to-diameter ratio of 10 was used to which was attached a series of wing planforms. The planforms included a family of delta wings and a family of rectangular wings having a constant root chord but varying spans so that wings of constant exposed area could be compared. In addition, a cranked-tip planform was included and a rectangular planform with reduced chord. Some results are presented for wing-body-tail configurations - one utilizing a cranked wing planform and one with wings having a constant root chord and span, but tip chords that were 0, 20, and 40 percent of the root chord. **SUPERSONIC AXIAL-FORCE CHARACTERISTICS OF A RECTANGULAR-BOX CAVITY WITH VARIOUS LENGTH-TO-DEPTH RATIOS IN A FLAT PLATE**

A. B. BLAIR, JR. and R. L. STALLINGS, JR. Apr. 1986 21 p refs

(NASA-TM-87659; L-16075; NAS 1.15:87659) Avail: NTIS HC A02/MF A01 CSCL 01A

A wind-tunnel investigation has been conducted at Mach numbers of 1.50, 2.16, and 2.86 to obtain axial-force data on a metric rectangular-box cavity with various length-to-depth ratios. The model was tested at angles of attack from -4 deg to -2 deg. The results are summarized to show variations in cavity axial-force coefficient for deep- and shallow-cavity configurations with detached and attached cavity flow fields, respectively. The results of the investigation indicate that for a wide range of cavity lengths and depths, good correlations of the cavity axial-force coefficients (based on cavity rear-face area) are obtained when these coefficients are plotted as a function of cavity length-to-depth ratio. Abrupt increases in the cavity axial-force coefficients at an angle of attack of 0 deg. reflect the transition from an open (detached) cavity flow field to a closed (attached) cavity flow field. Cavity length-to-depth ratio is the dominant factor affecting the switching of the cavity flow field from one type to the other. The type of cavity flow field (open or closed) is not dependent on the test angles of attack except near the critical value of length-to-depth ratio. Author

**RANDOM-CHOICE-METHOD SOLUTIONS FOR TWO-DIMENSIONAL PLANAR AND AXISYMMETRIC STEADY SUPERSONIC FLOWS**

Z. C. SHI and J. J. GOTTLIEB Jan. 1986 98 p refs

(UTIAS-297; ISSN-0082-5255) Avail: NTIS HC A05/MF A01

A random-choice method (RCM) is developed for obtaining fairly practical and efficient numerical solutions for two-dimensional planar and axisymmetric steady supersonic flows, such as those for sharp-edged planar airfoils, supersonic inlets of aircraft engines, pointed bodies of revolution, supersonic nozzles, and free jets. This method is based on the solution of a Riemann problem, which is the elemental solution of the hyperbolic equations of two-dimensional steady supersonic flows. The Riemann problem consists of two waves separated by a slip stream, and each wave can be either an oblique shock wave or a Prandtly-Meyer expansion wave. Advanced techniques are given for solving the Riemann problem iteratively, handling the boundary conditions along body and free-jet surfaces, and computing only certain parts of flow fields of interest. Many interesting and practical numerical solutions are presented for different types of planar and axisymmetric flows, to demonstrate the applicability, capability, and limitations of the RCM. Numerical results are shown to be in excellent agreement with both known analytical solutions and results from the method of characteristics. Author

**VORTEX BOUNDARY-LAYER INTERACTIONS Semiannual Status Report, 1 Sep. 1985 - 31 Feb. 1986**

P. BRADSHAW 1986 14 p

(Contract NAGW-581)

(NASA-CR-176701; NAS 1.26:176701) Avail: NTIS HC A02/MF A01 CSCL 01A

Parametric studies to identify a vortex generator were completed. Data acquisition in the first chosen configuration, in which a longitudinal vortex pair generated by an isolated delta wing starts to merge with a turbulent boundary layer on a flat plate fairly close to the leading edge is nearly completed. Work on a delta-wing/flat-plate combination, consisting of a flow visualization and hot wire measurements taken with a computer controlled traverse gear and data logging system were completed. Data taking and analysis have continued, and sample results for another cross stream plane are presented. Available data include all mean velocity components, second order mean products of turbulent fluctuations, and third order mean products. Implementation of a faster data logging system was accomplished. bg

**STATIC INVESTIGATION OF TWO STOL NOZZLE CONCEPTS WITH PITCH THRUST-VECTORING CAPABILITY**

M. L. MASON and J. R. BURLEY, II Apr. 1986 57 p refs

(NASA-TP-2559; L-165052; NAS 1.60:2559) Avail: NTIS HC A04/MF A01 CSCL 01A

A static investigation of the internal performance of two short take-off and landing (STOL) nozzle concepts with pitch thrust-vectoring capability has been conducted. An axisymmetric nozzle concept and a nonaxisymmetric nozzle concept were tested at dry and afterburning power settings. The axisymmetric concept consisted of a circular approach duct with a convergent-divergent nozzle. Pitch thrust vectoring was accomplished by vectoring the approach duct without changing the nozzle geometry. The nonaxisymmetric concept consisted of a two dimensional convergent-divergent nozzle. Pitch thrust vectoring was implemented by blocking the nozzle exit and deflecting a door in the lower nozzle flap. The test nozzle pressure ratio was varied up to 10.0, depending on model geometry. Results indicate that both pitch vectoring concepts produced resultant pitch vector angles which were nearly equal to the geometric pitch deflection angles. The axisymmetric nozzle concept had only small thrust losses at the largest pitch deflection angle of 70 deg., but the two-dimensional convergent-divergent nozzle concept had large performance losses at both of the two pitch deflection angles tested, 60 deg. and 70 deg. The aerodynamic characteristics of an advanced twin-engine fighter aircraft designed for supersonic cruise have been studied in the Langley 16-Foot Transonic Tunnel and the Lewis 10- by 10-Foot Supersonic Tunnel. The objective of this investigation was to establish an aerodynamic data base for the configuration with flow-through nacelles and representative inlets. The use of a canard for trim and the effects of fairing over the inlets were assessed. Comparisons between experimental and theoretical results were also made. The theoretical results were determined by using a potential vortex lift code for subsonic speeds and a linear aerodynamic code for supersonic speeds. This investigation was conducted at Mach numbers from 0.40 to 2.47, at angles of attack from 0 deg to about 20 deg, and at inlet capture ratios of about 0.5 to 1.4. Author

**EFFECTS OF UPPER-SURFACE NACELLES ON LONGITUDINAL AERODYNAMIC CHARACTERISTICS OF HIGH-WING TRANSPORT CONFIGURATION**

L. E. PUTNAM Apr. 1986 70 p refs

(NASA-TP-2579; L-16062; NAS 1.60:2579) Avail: NTIS HC A04/MF A01 CSCL 01A

An investigation has been conducted in the Langley 16-Foot Transonic Tunnel to determine the effects of installing and streamline contouring upper-surface nacelles on the longitudinal aerodynamic characteristics of a high-wing transport configuration. Also investigated were the effects of adding a fairing under the nacelle. The investigation was conducted at free-stream Mach numbers from 0.60 to 0.83 at angles fo attack from -2 deg to 4 deg. Flow-through nacelles were used. Streamline contouring the nacelles substantially reduced the interference drag due to installing the nacelles. Author

**USER'S GUIDE FOR NASCRIN: A VECTORIZED CODE FOR CALCULATING TWO-DIMENSIONAL SUPERSONIC INTERNAL FLOW FIELDS**

A. KUMAR Feb. 1984 70 p

(NASA-TM-85708; L-15678; NAS 1.15:85708) Avail: NTIS HC A04/MF A01 CSCL 01A

A computer program NASCRIN has been developed for analyzing two-dimensional flow fields in high-speed inlets. It solves the two-dimensional Euler or Navier-Stokes equations in conservation form by an explicit, two-step finite-difference method. An explicit-implicit method can also be used at the user's discretion for viscous flow calculations. For turbulent flow, an algebraic, two-layer eddy-viscosity model is used. The code is operational on the CDC CYBER 203 computer system and is highly vectorized to take full advantage of the vector-processing capability of the system. It is highly user oriented and is structured in such a way that for most supersonic flow problems, the user has to make only a few changes. Although the code is primarily written for supersonic internal flow, it can be used with suitable changes in the boundary conditions for a variety of other problems. Author

**INVESTIGATION TO ADVANCE PREDICTION TECHNIQUES OF THE LOW-SPEED AERODYNAMICS OF V/STOL AIRCRAFT**

B. MASKEW, D. STRASH, J. NATHMAN, and F. A. DVORAK Feb. 1985 153 p refs

(Contract NAS2-11169)

(NASA-CR-166479; NAS 1.26:166479) Avail: NTIS HC A08/MF A01 CSCL 01A

A computer program, VSAERO, has been applied to a number of V/STOL configurations with a view to advancing prediction techniques for the low-speed aerodynamic characteristics. The program couples a low-order panel method with surface streamline calculation and integral boundary layer procedures. The panel method--which uses piecewise constant source and doublet panels-includes an iterative procedure for wake shape and models boundary layer displacement effect using the source transpiration technique. Certain improvements to a basic vortex tube jet model were installed in the code prior to evaluation. Very promising results were obtained for surface pressures near a jet issuing at 90 deg from a flat plate. A solid core model was used in the initial part of the jet with a simple entrainment model. Preliminary representation of the downstream separation zone significantly improve the correlation. The program accurately predicted the pressure distribution inside the inlet on the Grumman 698-411 design at a range of flight conditions. Furthermore, coupled viscous/potential flow calculations gave very close correlation with experimentally determined operational boundaries dictated by the onset of separation inside the inlet. Experimentally observed degradation of these operational boundaries between nacelle-alone tests and tests on the full configuration were also indicated by the calculation. Application of the program to the General Dynamics

STOL fighter design were equally encouraging. Very close agreement was observed between experiment and calculation for the effects of power on pressure distribution, lift and lift curve slope. Author

**NONLINEAR POTENTIAL ANALYSIS TECHNIQUES FOR SUPERSONIC-HYPERSONIC AERODYNAMIC DESIGN**
V. SHANKAR and W. C. CLEVER 7 Mar. 1984 57 p refs
(NASA-CR-172299; NAS 1.26:172299) Avail: NTIS HC A04/MF A01 CSCL 01A

Approximate nonlinear inviscid theoretical techniques for predicting aerodynamic characteristics and surface pressures for relatively slender vehicles at supersonic and moderate hypersonic speeds were developed. Emphasis was placed on approaches that would be responsive to conceptual configuration design level of effort. Second order small disturbance and full potential theory was utilized to meet this objective. Numerical codes were developed for relatively general three dimensional geometries to evaluate the capability of the approximate equations of motion considered. Results from the computations indicate good agreement with experimental results for a variety of wing, body, and wing-body shapes. Author

**VALIDATION OF USAF STABILITY AND CONTROL DATCOM METHODOLOGIES FOR STRAIGHT-TAPERED SWEPTFORWARD WINGS Final Report, 1 Nov. 1980 - 30 Apr. 1984**
D. G. SHARPES Jul. 1985 211 p
(Contract AF PROJ. 2403)
(AD-A161876; AFWAL-TR-84-3084) Avail: NTIS HC A10/MF A01 CSCL 20D

A detailed review of USAF Stability and Control Datcom methodologies was conducted to determine their validity for application to straight tapered, sweptforward wing configurations. To the extent possible the format found in the Datcom is repeated in this report. Several methods were modified to enable more accurate coefficient prediction (e.g., Wing Zero-Lift Angle of Attack, Downwash and Yawing Moment due to Yaw Rate) irrespective of sweep sign. At supersonic speeds, the reversibility theorem enabled most methodologies to be used without any modifications to account for sweptforward leading-edge designs. For the methodologies validated, sweptforward-wing estimation results were generally as accurate as the sweptback-wing results presented in the Datcom. Unfortunately, lack of test data prevented validation of several empirical methodologies (e.g., Subsonic High Angle-of-Attack Pitching Moment and Transonic Pitching Moment). No estimation methodologies are proposed in these cases. Author (GRA)

**OPTIMIZATION OF TIP STORE MODELING Final Report, May 1983 - Sep. 1984**
A. G. STRIZ and S. K. JANG Mar. 1985 105 p
(Contract AF-AFOSR-0184-83)
(AD-A162119; AFOSR-85-1089TR) Avail: NTIS HC A06/MF A01 CSCL 20D

Due to the high cost of performing detailed three-dimensional flutter analyses for aircraft which are carrying large numbers and types of external stores, it is often not economically feasible to include sophisticated store aerodynamics especially when they will not cause significant changes to the flutter results. Thus, the stores are presently often modeled as simple flat plates. This tends to decrease the accuracy of the computed pressure distributions as the spanwise flow field and the wing-body interaction are not represented correctly. In this report, therefore, two methods, a doublet lattice method for subsonic flow and a kernel function method for subsonic and supersonic flow are used for the computation of unsteady pressure distributions and forces on an F-5 wing with a tip mounted launcher/store combination for various store models consisting of simple flat plates, endplated, and axisymmetric bodies. The resulting aerodynamic data are compared to existing experimental and numerical results for the same wing/store combination. The store modeling was optimized for simplicity and accuracy with respect to the aerodynamic forces and pressures. The wing-body interaction was improved without a considerable increase in complexity, i.e., panel number, and thus computational effort. Author (GRA)

A block-structured solution scheme is developed for the analysis of three-dimensional transonic flows. The scheme is based on the solution of potential flow equations for individual blocks representing part of the flow field. Based on a previously developed block-structured grid generation scheme, appropriate computational grids are generated for each of the blocks depending on the complexity of the local flow field. The equations are then solved to provide a solution of a large problem in terms of an assembly of smaller problems for each block. Numerical results illustrate the applicability of the method for a three-dimensional flow field around a wing profile (NACA0012). Different block structures are analyzed to demonstrate the robustness and the accuracy of the developed method. Finally a three-dimensional wing-body configuration is analyzed and the results are compared with previously obtained single block solutions. The method is expandable to the solution of Euler and Navier-Stokes equations. It is also suited to be executed in a parallel processing environment. GRA

**COUPLING LINEARIZED FAR-FIELD BOUNDARY CONDITIONS WITH NONLINEAR NEAR-FIELD SOLUTIONS IN TRANSONIC FLOW Annual Report, 1 Jul. 1983 - 1 Feb. 1985**
W. S. ROWE and F. E. EHLERS 1 Feb. 1985 82 p
(Contract F49620-83-C-0118)
(AD-A162334; D6-52895; AFOSR-85-1082TR) Avail: NTIS HC A05/MF A01 CSCL 20D

This investigation evaluated the feasibility of coupling linearized far-field finite differencing equations to reduce the size of grid networks required in present transonic flow calculations. A procedural change to an existing finite differencing program involved distributing sources on the solution interface boundary in order to develop the proper far-field outgoing wave boundary condition on a reduced size grid network. Validation of the modification procedure was established for zero thickness airfoils by comparing predicted two-dimensional results with results obtained from an exact procedure. A criterion based on the gradient of the flow field Mach number was developed for use in establishing the minimum size grid network necessary for accurate finite thickness unsteady loading predictions. Acceptable loading predictions were achieved for a nominal 5:1 gridsize reduction ratio with a 40% reduction in computer usage costs. GRA

(REPT-A-13/85) Avail: NTIS HC A06/MF A01

A measuring system to determine flow fields of airfoils was developed. Pressure distribution measurements and pictures were taken to characterize all flight conditions in the domain of high angles of attack where flow separation phenomena are very important. The developed direct flow field measuring system uses hot-wire anemometry and enables the investigation of three-dimensional separation effects on an arrow wing. The results provide important information about the separation behavior of such wings and fundamentals for the development and testing of theoretical methods to calculate separated wing flow. **NUMERICAL SIMULATION OF VORTICES SHED BEHIND A ROTATING WING**

N. IZUTSU and H. KANDA (IBM Japan, Ltd.) *In its* Proceedings of the Symposium on Mechanics for Space Flight p 43-50 Mar. 1985 refs Sponsored in part by IBM Japan, Ltd.
Avail: NTIS HC A08/MF A01

The vortices shed behind a 15%-thick, two dimensional elliptic cylinder rotating around its spanwise axis perpendicularly to a uniform flow were numerically analyzed using discrete vortex-blob method. The color coded vorticity distributions in the flow field were displayed in both cases of the forced and autorotation. Moreover, a 16 mm animation movie of it was made to visualize vortex interactions. By means of this color graphic simulation, the merging rearrangement, interaction and splitting of the vortices in the wake flow of a rotating wing were demonstrated making these processes clearly understandable. **CONTROLLED-FLIGHT-INTO-TERRAIN ACCIDENTS DURING UNPUBLISHED-ROUTE RADAR VECTORING**

J. M. MCCORMICK, JR. (Air Line Pilots Association, Washington, DC) IN: Symposium on Aviation Psychology, 3rd, Columbus, OH, April 22-25, 1985, Proceedings . Columbus, OH, Ohio State University, 1985, p. 199-206. refs

The present paper is concerned with Controlled-Flight-Into-Terrain (CFIT) accidents involving aircraft operated under Instrument Flight Rules (IFR) in controlled airspace, taking into account Instrument Meteorological Conditions (IMC) and Night Visual Meteorological Conditions (NVMC). As an example for the type of accident being considered, an event is described in which an instrument flight instructor and her student in a single-engine Cessna aircraft impacted mountainous terrain at the 3500-foot level. Attention is given to the guidance of the aircraft with the aid of 'radar vectors', the loss of voice communication between controller and aircraft, and questions concerning a situation which made a flight of five minutes duration in the clouds toward high terrain by an experienced flight instructor possible. It is found that problems can arise because pilots are routinely guided over unpublished 'radar routes'. Interim and long-term solutions to these problems are discussed. G.R.

**AIR TRANSPORT PILOT INVOLVEMENT IN GENERAL AVIATION ACCIDENTS**

S. SALVATORE, S. HUNTLEY, and P. MENGERT (DOT, Transportation Systems Center, Cambridge, MA) IN: Symposium on Aviation Psychology, 3rd, Columbus, OH, April 22-25, 1985, Proceedings . Columbus, OH, Ohio State University, 1985, p. 729-739.

The involvement of airline transport pilots (ATPs) and private pilots (PVTs) flying general aviation (GA) aircraft in fatal and nonfatal accidents is investigated. Accident records for GA accidents occurring between 1973-1983 are studied; the data indicate that PVTs were involved in 13,219 nonfatal and 2,454 fatal accidents, and ATPs produced 461 nonfatal and 96 fatal accidents. Analysis of the data reveals that the ATPs comprise 7.5 percent of pilots, but account for only 3 percent of GA accidents while having greater exposure time than PVTs. Accident characteristics, causes, and pilot behaviors which differentiate the two groups are described. It is concluded that ATPs are involved in less GA pilot-induced accidents, less weather-related accidents, and less accidents in traffic patterns than PVTs due to their superior flying skills. I.F.

**INVESTIGATION OF AN AIRCRAFT ACCIDENT BY FRACTOGRAPHIC ANALYSIS**

R. V. KRISHNAN, S. RADHAKRISHNAN, A. C. RAGHURAM, and V. RAMACHANDRAN (National Aeronautical Laboratory, Bangalore, India) IN: Advances in fracture research (Fracture 84). Volume 5 . Oxford and New York, Pergamon Press, 1986, p. 3677-3684. refs

A Boeing 737 passenger aircraft suffered a mid-air explosion in the front toilet area during a scheduled flight and forced the pilot to make an emergency landing. In that process the aircraft overshot the runway damaging its undercarriage and underside. To determine the primary cause of explosion and its exact location, extensive fractographic examination was carried out on the fragments found near the explosion area. These fragments contained signatures characteristic of explosive fracture. The exact location of these fragments in the original aircraft structure was identified. It was concluded that the accident was due to a chemical explosion inside the front toilet of the aircraft. By tracing the trajectories of the projectiles flying in various directions following the explosion, the centre of the explosion, i.e., the location of the explosive device in the aircraft was established to be the waste paper receptacle placed under the wash basin. **SURVIVAL OF HELICOPTER ACCIDENTS [SUPERVIVENCIA EN LOS ACCIDENTES DE HELICOPTEROS]**
J. A. ROJAS LOZANO (Escuela Tecnica Superior de Ingenieros Aeronauticos, Madrid, Spain) IAA/Ingenieria Aeronautica y Astronautica (ISSN 0020-1006), Oct. 1985, p. 31-36. In Spanish. refs

An evaluation is made of anthropometric factors relevant to the improvement of helicopter crash injury rates, in view of a U.S. Army study of helicopter crashes occurring in 1970-1971 which estimated that as many as 160 fatalities could have been prevented with suitable attention by designers to crash survival criteria. Attention is given to the capacity of the human body for absorption of the impact loads of sudden deceleration; data are presented for the effects of harnesses and the duration and magnitude limits of human resistance to injury by sudden deceleration. O.C.

**ACCIDENT OF THE DC-10 EC-DEG AIRCRAFT AT MALAGA ON SEPTEMBER 13, 1982 [ACCIDENTE DEL AVION DC-10 EC-DEG EN MALAGA EL 13 DE SEPTIEMBRE DE 1982]**
IAA/Ingenieria Aeronautica y Astronautica (ISSN 0020-1006), Jan. 1986, p. 24-31. In Spanish.

The present analysis of the abortive takeoff-type accident of a DC-10 at Malaga airport gives attention to the velocity profiles of the aircraft from takeoff to ground impact. A fire followed ground impact. Takeoff abort was initiated by the crew with only 1295 m of runway left beneath the aircraft. On the basis of the data obtained by this analysis, it is recommended that both pilots and other flight crew members be trained to respond to takeoff failures due to causes other than loss of engine power, such as landing gear collapse. O.C.

**THE ECONOMICS OF THE NORTH ATLANTIC AIR TRAFFIC SYSTEM**
V. W. ATTWOOLL Journal of Navigation (ISSN 0020-3009), vol. 39, Jan. 1986, p. 103-109.

The effects of the meteorological environment and navigational restrictions on the North Atlantic air traffic system are investigated. The use of 12-hour and 24-hour forecasts to plan the proper organized track structure for aircraft to follow over the Atlantic is discussed. Inaccurate forecasting influences the fuel consumption and arrival times of the aircraft. The penalties that result from separation minima imposed by the air traffic control, which are 60 n.m. laterally and 2000 ft vertically, are examined; these limitations cause changes in flight plans and do not permit the optimum performance of the aircraft. Methods of improving the North Atlantic air traffic system, including the use of a composite track system, a reduction in vertical separation form 2000 ft to 1000 ft, and the use of later and more accurate weather forecasts, are described. I.F.

**AIRLINES AND THE NEW TECHNOLOGY AIRCRAFT - A DISCUSSION PAPER**
G. A. C. GRAY (British Airways, PLC, Hounslow, England) Journal of Navigation (ISSN 0020-3009), vol. 39, Jan. 1986, p. 110-119.

Advances in aircraft technology and crew training procedures are studied. The configuration of the flight deck, new flight instruments and displays, and crew procedures for the new aircraft are described. The required interactions between air traffic control and the flight crew in order to assure the optimum performance of the aircraft are examined. The use of audio visual tutors and flight simulator to train the pilots on the functions of electronic flight instrumentation, automatic flight control, and flight management computers is investigated. The advantages and disadvantages of the digital computation systems are analyzed. Future developments in avionics such as a comprehensive data-link network are discussed. I.F.

**ANATOMY OF A NOISE-ABATEMENT CLIMB**
M. A. GARBELL (M.A.G. Consultants, Inc., San Francisco, CA) IN: Inter-noise 85; Proceedings of the Fourteenth International Conference on Noise Control Engineering, Munich, West Germany, September 18-20, 1985. Volume 1 . Dortmund, West Germany, Bundesanstalt fuer Arbeitsschutz, 1985, p. 311-314. refs

Noise abatement aircraft climb techniques for the first 10-12 nautical miles of flight are discussed. The basic prerequisites for a safe and efficient climb are reviewed, and the factors controlling the intensity of noise emission at a point on the ground are described along with the standard types of noise-abatement climbs. The effect of meteorological parameters on aircraft noise is summarized, and the quality of the currently available data base on climb procedures and noise abatement is assessed. C.D.

**BIODYNAMICS OF PERSONNEL PARACHUTE LANDINGS - A FRESH LOOK AT PARACHUTE DESCENT RATES**
D. C. JOHANSON and K. E. WITTENDORFER (U.S. Navy, Naval Weapons Center, China Lake, CA) SAFE Journal, vol. 16, Spring 1986, p. 16-23.

A test program has been established to provide biodynamic data of simulated parachute landings which, when combined with biomechanical data and a computer model, will indicate the safety of various combinations of total speed and angle of impact. This information will then provide more substantial justification into the maximum acceptable velocities for specifications such as MIL-P-85710 and MIL-S-18471. Test facility components include a 59-foot rail assembly which can be adjusted to assume angles from the vertical to the horizontal, a jumper connected to a launch vehicle via a parachute harness and risers, and a velocity-measuring gravity-assisted pulley control system. After obtaining specified steady-state conditions, the subject performs a forward right plf upon ground contact. Data displayed reduced g levels in the four-foot plf, in comparison with a four-foot standup landing, supporting the advantages in performing a plf. Time-dependent quantities of acceleration, delta velocity, body angle, and angulalr rate were plotted, and a viable method of determining relationships between the impact velocity vector and transducer signals has been found. K.K.

**EVALUATION OF THE CRASH ENVIRONMENT AND INJURY-CAUSING HAZARDS IN U.S. NAVY HELICOPTERS**
J. W. COLTMAN, S. ARNDT (Simula, Inc., Phoenix, AZ), and L. DOMZALSKI (U.S. Navy, Naval Air Development Center, Warminster, PA) SAFE Journal, vol. 16, Spring 1986, p. 44-50. refs

A survey of the crash environment for U.S. Navy helicopters was undertaken to quantify the impact parameters and identify hazards causing major injury. One hundred and eighty-six (186) Flight Mishaps were reviewed for the 10-year period of January 1972 to December 1981. Out of the 186 mishaps reviewed, 154 were judged to be survivable. Accident reconstruction was used to determine the impact parameters for the survivable accidents. Statistical distribution of the important impact parameters, such as pitch, roll, and yaw angle and vertical, horizontal and lateral velocity change, were developed. Also, a hazard analysis was conducted to correlate the major and fatal injuries to the injury-causing hazards mechanisms. Sixteen specific injury-causing hazards were identified. The data developed in this study provides the basis for improving the crashworthiness of the existing helicopter fleet and of future Navy aircraft. Author

**MAJOR SHORT-HAUL ROLE SEEN FOR TILT-ROTOR AIRCRAFT**
R. F. SPIVEY (Bell Helicopter Textron, Fort Worth, TX) ICAO Bulletin, vol. 41, Feb. 1986, p. 25-28.

An evaluation is made of the prospective impact of tilt-rotor aircraft VTOL operations, in the air taxy and city center-to-city center commuter fields, on airport congestion. The tilt rotor VTOL aircraft envisioned in these performance evaluations is a civilian version of the U.S. Armed Forces' 'JVX', which is in turn a scale-up development of the XV-15 test aircraft. Emphasis is given to the ability of a tilt-rotor aircraft in its commuter airliner function to bypass regional airports and deliver passengers to city centers directly. O.C.

**WIND TUNNEL TESTS OF ROTOR BLADE SECTIONS WITH REPLICATIONS OF ICE FORMATIONS ACCRETED IN HOVER Final Report**
J. D. LEE, J. H. BERGER (Fluidyne Engineering Corp., Columbus, Ohio), and T. J. MCDONALD (Fluidyne Engineering Corp., Columbus, Ohio) Mar. 1986 31 p refs
(Contract NAG3-374)
(NASA-CR-175089; NAS 1.26:175089) Avail: NTIS HC A03/MF A01 CSCL 01C

Full scale reproductions of ice accretions molded during the documentation of a hover test program were fabricated by means of epoxy castings and used for a wind tunnel test program. Surface static pressure distributions were recorded and used to evaluate lift and pitching moment increments while drag was determined by wake surveys. Through the range of the tests, corresponding to those conditions encountered in hover and in flat pitch, integration of the pressure distributions showed negligible changes in lift and in pitching moment, but the drag was significantly increased. **DOCUMENTATION OF ICE SHAPES ACCRETED ON THE MAIN ROTOR OF A UH-1H HELICOPTER IN LEVEL FLIGHT Final Report**
M. K. HANSON and J. D. LEE (Ohio State Univ., Columbus) Mar. 1986 14 p refs
(Contract NAG3-374)
(NASA-CR-175088; NAS 1.26:175088) Avail: NTIS HC A02/MF A01 CSCL 01C

Icing tests were conducted on a UH-1H helicopter in level flight behind a spray tanker near Duluth, Minnesota, during the winter of 1983-84 as part of the joint NASA/Army HIFT program. On landing, the ice formations on the main rotor were documented by casting a set of ten-inch molds on the blade using a Dow-Corning silicone rubber compound which was initially liquid at sub-freezing temperatures. Such documentation was accomplished for eight flights in which the temperature ranged from -11 C to -22 C and the in-cloud flight times ranged from 5 to 9 minutes. Author

**THE AUSTRALIAN IMPLEMENTATION OF AMDAR/ACARS AND THE USE OF DERIVED EQUIVALENT GUST VELOCITY AS A TURBULENCE INDICATOR**
D. J. SHERMAN Oct. 1985 42 p refs
(AR-004-51; ARL-STRUC-R-418) Avail: NTIS HC A03/MF A01

AMDAR is a system of measuring wind speed, wind direction, air temperature and an indication of turbulence from INS equipped transport aircraft in flight. These data are transmitted by radio to the meteorological system. This report outlines the Australian AMDAR system presently coming into service on the Boeing 767 aircraft in the Ansett fleet. The data are telemetered using ACARS and the SITA/AIRCOM network of ground stations. Particular attention is paid to the indicator of turbulence. Because an aircraft flying through a given gust may encounter very different vertical accelerations depending on aircraft mass, airspeed and altitude, it is proposed that the AMDAR system compute the derived equivalent gust velocity from the aircraft acceleration and other parameters, and that this is used as an indicator of turbulence. Such an indicator has the additional advantage that it is more use for climatological studies of turbulence occurrence than simpler indicators such as the aircraft vertical acceleration. Severe turbulence corresponds to derived equivalent gust velocities in excess of g m/s. Author

**ANALYTICAL DETERMINATION OF PROPELLER PERFORMANCE DEGRADATION DUE TO ICE ACCRETION Final Report**
T. L. MILLER Apr. 1986 138 p refs
(Contract NAS3-24105)
(NASA-CR-175092; NAS 1.26:175092) Avail: NTIS HC A07/MF A01 CSCL 01C

A computer code has been developed which is capable of computing propeller performance for clean, glaze, or rime iced propeller configurations, thereby providing a mechanism for determining the degree of performance degradation which results from a given icing encounter. The inviscid, incompressible flow field at each specified propeller radial location is first computed using the Theodorsen transformation method of conformal mapping. A droplet trajectory computation then calculates droplet impingement points and airfoil collection efficiency for each radial location, at which point several user-selectable empirical correlations are available for determining the aerodynamic penalities which arise due to the ice accretion. Propeller performance is finally computed using strip analysis for either the clean or iced propeller. In the iced mode, the differential thrust and torque coefficient equations are modified by the drag and lift coefficient increments due to ice to obtain the appropriate iced values. Comparison with available experimental propeller icing data shows good agreement in several cases. The code's capability to properly predict iced thrust coefficient, power coefficient, and propeller efficiency is shown to be dependent on the choice of empirical correlation employed as well as proper specification of radial icing extent. **FLIGHT TEST OF A VELOCITY AUGMENTED STRAPDOWN NAVIGATION SYSTEM LHN-81**

H.-J. HOTOP, H.-P. ZENZ (DFVLR, Institut fuer Flugfuehrung, Brunswick, West Germany), and M. KLEINSCHMIDT (LITEF-Litton Technische Werke, Freiburg im Breisgau, West Germany) IN: Symposium Gyro Technology 1985; Proceedings of the Symposium, Stuttgart, West Germany, September 24, 25, 1985 . Stuttgart/Duesseldorf, Universitaet Stuttgart/Deutsche Gesellschaft fuer Ortung und Navigation, 1985, p. 16.0-16.21. refs

Helicopter-based flight tests have been conducted for the LHN-81 hybrid navigation system, which is of the inertial strapdown type and is augmented by a Doppler velocity sensor and a magnetic heading sensor; performance comparisons have been made with the existing LTN-90 inertial navigation system, whose accuracy had been increased by means of an offline algorithm. The position accuracy of the LHN-81 is 1.3 percent in 95 percent of all events. For a nap-of-the-earth flight profile with helicopter dynamics, the 95-percent CEP accuracy in 15 min of flight time was less than 100 m. O.C.

**GRAPHIC SIMULATION FOR AIR TRAFFIC CONTROL DEVELOPMENT**

E. S. STEIN (FAA Technical Center, Atlantic City, NJ) IN: 1985 Summer Computer Simulation Conference, Chicago, IL, July 22-24, 1985, Proceedings . San Diego, CA, Society for Computer Simulation, 1985, p. 653-656. refs

In air traffic control, graphic simulation means employing equipment currently available to provide a two-dimensional representation of the three-dimensional airspace using a preplanned 'canned' air traffic scenario. The background history of the use of graphic simulation in aviation is examined, taking into account the use of situational graphics to evaluate potential pilots' abilities to relate aircraft orientation to instrument displays. In developments toward higher levels of automation, one family of tools is AERA, the automated en route air traffic control program. Aspects of AERA graphic simulation are examined, giving attention to the problem, the laboratory, the flight data display, the radar planned view display, and an overview of the graphic simulation. The employment of graphic simulation is also discussed. G.R.

**KNOWLEDGE-BASED APPROACH TOWARD DEVELOPING AN AUTONOMOUS HELICOPTER SYSTEM**

J. F. GILMORE and A. C. SEMECO (Georgia Institute of Technology, Atlanta) Optical Engineering (ISSN 0091-3286), vol. 25, March 1986, p. 415-427. Research supported by the Georgia Institute of Technology. refs

This paper presents a description of the Autonomous Helicopter System (AHS) which is currently being implemented in the Georgia Tech Research Institute. It is pointed out that autonomous vehicles provide a mechanism for removing humans from modern-day battlefields while not impacting the tactical capabilities of the battle force. Civilian applications for such a device include the investigation of hazardous areas, search over large areas, and the monitoring of large facilities. The AHS consists of three sections. The vision section is the sensor processing component of the AHS. Attention is given to image segmentation, region classification, scene analysis, visual model construction, scene matching, and threat location and coverage. The goal of the planning section is to produce an executable plan of action which can be implemented by the control section. The goal of the control section is also discussed, and an autonomous helicopter mission is described. G.R.

**RASP - A SYSTEM GENERATING VERY ACCURATE POSITION MARKERS DURING FLIGHT TESTING**

O. B. M. PIETERSEN (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 7 p.
(AIAA PAPER 86-9802)

This paper describes a system with which the one-dimensional position of an aircraft in the flight direction can be determined with a very high accuracy. The ground- and airborne parts of the system are discussed, as well as the factors which influence the accuracy. It is shown that the attainable accuracy is in the order of 0.3 meter if the aircraft flies at low altitude above the centerline of the runway. If the aircraft taxies, a situation often occuring during take-off and landing trials, the accuracy is better than 0.1 meter. Author

**PERFORMANCE CHARACTERISTICS OF TRANSPONDER-AIDED VERSUS GPS-AIDED INERTIAL NAVIGATION SYSTEMS**

C. O. SMITH, JR. and D. J. BIEZAD (USAF, Institute of Technology, Wright-Patterson AFB, OH) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 9 p. refs
(AIAA PAPER 86-9817)

By combining excellent short term inertial navigation system (INS) performance with the long term performance benefits of the Global Positioning System (GPS) a beneficial synergistic effect can be obtained, and integrated GPS-INS (IGI) covariance analysis packages have been employed to develop high order error models. This paper is concerned with a modification of an IGI simulation program, taking into account the necessity to improve the Completely Integrated Reference and Instrumentation System (IRIS). This improvement is required to test the extremely accurate navigation systems now built by industry. A covariance analysis showed that the CIRIS model aided by GPS performed much better than the CIRIS alone, as expected, but not substantially better than the GPS/INS model with the ground transponders eliminated. For this reason, the potential exists to increase reference trajectory accuracy while simultaneously decreasing problems in routing, logistics, reliability, and maintainability of the transponders. G.R.

### PERFORMANCE ANALYSIS OF AIRBORNE PULSE DOPPLER RADAR

P. E. HOLBOURN and A. M. KINGHORN (Ferranti Defence Systems, Ltd., Edinburgh, Scotland) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 12-16.

Design of a satisfactory radar waveform requires that a number of design trade-offs be considered. It is thus an essential part of the design process to make parametric analyses of detection performance. This paper presents the unique features of a computer program that has been developed to perform such calculations for high and medium PRF systems. Clutter levels are computed in all ambiguous range-doppler cells for a variety of flight geometries and ground clutter models. The effects of receiver eclipsing, sidelobe clutter and mainbeam clutter are included. Target detectability is calculated for all values of range and Doppler within a specified envelope. These results are expressed graphically in the form of a blindzone diagram. The obscuration effects of clutter are expressed as a clutter loss. Blindzone diagrams for notional high and medium PRF systems are presented. The variation in performance of a medium PRF system to radar altitude and transmitter peak power is investigated. Author

**A86-32579**

### EFFICIENT, CLOSED-FORM COMPUTATION OF AIRBORNE PULSE-DOPPLER RADAR CLUTTER

J. K. JAO and W. B. GOGGINS (MIT, Lexington, MA) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 17-22. DARPA-sponsored research. refs

Closed-form expressions are derived for airborne pulse-Doppler radars to calculate the ground clutter of a range-Doppler cell under that flat earth assumption. These expressions enable accurate and efficient computation of both radar sidelobe and main lobe clutter for an arbitrary combination of radar pulse-Doppler waveform and low altitude flight configurations as defined by platform speed and dive angle. The results should be useful in the simulation and evaluation of airborne radar performance. Author

### ADVANCES IN SECONDARY SURVEILLANCE RADAR SYSTEMS

R. J. W. SCLATER (Marconi Radar Systems, Ltd., Chelmsford, England) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 29-33.

The features of modern monopulse secondary surveillance radar (SSR) system, called Messenger, are discussed. The structural details of the system, including a new antenna design, the interrogator-responser, the decoder, the plot former, and plot processor, are described. The monopulse SSR, which requires only a single reply to obtain target azimuth, overcomes the disadvantages of the fruiting and the high number of lost replies encountered by the conventional SSR. In addition, a monopulse SSR can operate in a stand-alone configuration and can be upgraded to Mode S. Diagrams and schemes are included. I.S.

### A RADAR ANALYSIS PROGRAM FOR EVALUATING AND MONITORING PRIMARY AND SECONDARY RADAR SYSTEMS

T. BERGENSTOFF, P. R. CLAUSEN, and F. THOMSEN (Royal Danish Air Force, Vedbaek, Denmark) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 146-150.

This paper describes a Radar Analysis Program for evaluation and monitoring of a Radar System. The program is a general purpose facility for all Radar System containing a Primary and a Secondary radar. The program only requires data from the extractors of the Primary and Secondary Radar. The program has facilities for evaluating the performance of individual beams in 3 Dimensional Radar Systems and height accuracy of Height Finders using IFF mode C informations. The program evaluates the radar performance by analyzing the association of Primary and Secondary Plots of targets of opportunity. This method drastically reduces expenses to Test Flights and permits a continuous quality monitoring of a Radar System. The program has been used successfully for several years for monitoring and evaluating Danish military and civilian Air Traffic Radar Systems. Author

### PARAMETERS OF A DEDICATED WEATHER RADAR FOR TERMINAL AIR NAVIGATION, TRAFFIC CONTROL AND SAFETY

P. R. MAHAPATRA (Indian Institute of Science, Bangalore, India) and D. S. ZRNIC (NOAA, National Severe Storms Laboratory, Norman, OK ) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 235-240. refs

The interservice NEXRAD Doppler weather radar system, which is under development and proving, is expected to significantly aid in fulfilling FAA's projected aviation weather observation needs in the enroute sector. However, there are questions about its adequacy for the highly dense and dynamic operations ocurring in terminal areas. The constraints arise both from its basic design parameters as dictated by its multi-use role and from its location as part of a national grid. There is need for dedicated terminal area weather radars, especially at large and busy airports. For economy and faster implementation, it is desirable to use as much of NEXRAD hardware and software as possible in these terminal area radars, and only modify the operating parameters to suit dedicated terminal area operation. This paper provides the outline for choice of parameters for such a role and indicates a possible set of parameters. Author

### SPACE BASED RADAR APPLICATION TO AIR TRAFFIC CONTROL

W. J. CAIME (General Electric Co., Space Systems Div., Valley Forge, PA) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 312-321. NASA-supported research. refs

Future control of increasing air traffic on international routes will require significant advances in techniques employed. Development is underway, but at this time does not include addition of radar coverage of vast areas of oceanic traffic. This paper addresses the potential for a space-based radar to provide detection and track of aircraft in future traffic scenarios. Factors that must be considered in further tradeoff and concept optimization are discussed. These include: (1) satellite constellation characteristics and associated coverage, (2) efficient use of available energy in track-while-scan strategies, (3) development of tracker approaches to accommodate inherent system constraints, and (4) the application of transponders to assist in dense traffic environments. The analysis assumes the continued development and availability of technology required for high spacecraft power systems (hundreds of kilowatts), and for radar subclutter visibility. Author

### SPACE-BASED BISTATIC RADAR - OPPORTUNITY FOR FUTURE TACTICAL AIR SURVEILLANCE

P. K. LEE and T. F. COFFEY (Mitre Corp., Bedford, MA) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 322-329. USAF-supported research. refs

A space-based bistatic radar (SBBR) in geostationary orbit would be useful for future tactical air surveillance. It should be technically feasible to develop such a radar by the mid-1990's, at which time several critical technologies will have reached maturity for the application. This paper presents a conceptual design of an SBBR and a rough estimate of the gross weight of the space segment, based on the projected technologies. Author

**RAID COUNT BY AUTOCORRELATION**

K. J. HAMMERLE (Boeing Aerospace Co., Seattle, WA) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 350-354.

It has been hypothesized that a radar can accomplish an aircraft raid count, despite the efforts of an escort jammer, if an autocorrelation operation is performed on the received jammer signal. The concept is based on the assumption that a significant amount of jammer energy is scattered into the 'victim' radar receiver by reflection from the 'quiet' aircraft being escorted and that this energy may be detected by autocorrelating the total signal received at the victim radar receiver. This study presents a theoretical analysis of the concept. Equations, which include all pertinent variables, are derived to define the volume of space surrounding the jammer in which quiet aircraft may be detected. Detection contours are plotted for certain specific cases. Author

**THE DESIGN, CONSTRUCTION AND EARLY TRIALS OF A NOVEL AIRBORNE SURVEILLANCE RADAR**

J. G. SCHOENENBERGER and P. D. L. WILLIAMS (Racal-Decca Advanced Development, Ltd., Walton-on-Thames, England) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 372-377. refs

Attention is given to a novel airborne surveillance radar that originated in a conventional pulse radar carried under a variety of test aircraft and which was then upgraded to SLAR equipment incorporating a bandwidth processor for the real time recording of images on an inexpensive audio tape deck. Ocean surface imagery of reasonable quality has been obtained by these means. The system is expected to be useful in searches for patterns of shipping and features such as oil slicks and thermal currents in disturbed water. O.C.

**MULTIRADAR TRACKING IN THE NEW ATC SYSTEM AT MAZATLAN (MEXICO) AREA CONTROL CENTER**

B. FURCOLO, S. PARDINI, and R. PELAGATTI (Selenia S.p.A., Rome, Italy) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 403-409.

The multiradar tracking system for the Flight Information Region of Mazatlan integrates ATC radars located in western Mexico. Local tracking data are sent after suitable conversion to a central data processing center, which combines the data to generate a single multiradar track for each target. The distributed intelligence system architecture employed eases the workloads of the central processor. New solutions have been adopted for the track-combination algorithm which take into account the accuracy of the cooperating radars, target behavior, and the time of the local track detection. O.C.

**OPERATIONAL ACCEPTABILITY OF 2.4 KBPS SPEECH FOR TACTICAL COMMUNICATIONS**

H. SCHECTER (Support Systems Associates, Inc., Lexington, MA) and J. TIERNEY (MIT, Lexington, MA) IN: MILCOM '85 - Military Communications Conference, Boston, MA, October 20-23, 1985, Conference Record. Volume 1 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 171-175. USAF-sponsored research. refs

This paper describes a series of tests aimed at estimating the operational acceptability of 2.4 kbps LPC speech in high acoustic noise, tactical combat environments. F-15 fighter pilots and E3A (AWACS) controllers, operating in their normal acoustic environments, ran simulated combat missions by communicating via a 2.4 kbps test channel. They then 'graded' the channel by means of a brief questionnaire. Three LPC algorithms (with DRT scores of 71, 75 and 80 percent) were used. The results, although not definitive, suggest that purposeful users will accept lower intelligibility than vocoder designers might expect. The results also indicate a need to examine the effect of listeners' acoustic noise level on intelligibility scores. Author

**A86-32824**

**ASSESSING THE INTELLIGIBILITY AND ACCEPTABILITY OF VOICE COMMUNICATION SYSTEMS**

R. L. PRATT (Royal Signals and Radar Establishment, Malvern, England) IN: MILCOM '85 - Military Communications Conference, Boston, MA, October 20-23, 1985, Conference Record. Volume 1 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 176-180.

Methods of assessing the intelligibility and acceptability of voice communication systems are examined. The procedures for the diagnostic rhyme test (DRT) are described. The speech-to-noise ratio data obtained from the DRT are analyzed; the DRT produces intelligibility scores. The utilization of flight simulator sofware packages to estimate the acceptability of voice communication systems is discussed. A comparison of DRT scores and sofware data evaluates the applicability of the communication system. I.F.

**FAA AIR TRAFFIC CONTROL PROGRAM MANAGEMENT TECHNOLOGY APPLICATIONS**

H. E. GARTRELL, D. A. SABESKY, and P. E. FITZGERALD, JR. IN: Man's permanent presence in space; Proceedings of the Third Annual Aerospace Technology Symposium, New Orleans, LA, November 7, 8, 1985 . New Orleans, LA, American Institute of Aeronautics and Astronautics, 1985, 19 p.

(Contract DOT-FA01-84-C-00017)

The program management technology software tools and state of art processes used by the FAA's National Airspace System (NAS) are identified. The reasons for NAS, and design drivers which impel its improvement, and the main categories of its 90 projects are reviewed. The Air Traffic Control Element, Ground-to-Air Element, Interfacility Communication Element, and Maintenance and Operations Support Element of the NAS are described, and its Program Management System is discussed. C.D.

**GLIDE SLOPE INDICATOR SYSTEM Patent**

I. S. WYATT and H. L. TASK, inventors (to Air Force) 19 Nov. 1985 6 p Supersedes AD-D010173

(AD-D012077; US-PATENT-4,554,543;

US-PATENT-APPL-SN-473392; US-PATENT-CLASS-340-948)

Avail: US Patent and Trademark Office CSCL 01E

A glide slope indicator system in which light from an incoming aircraft's landing light is shaped by spherical/cylindrical lens combination into a line image which strikes a linear photodiode array. By determining which photodiode in the array the center of the line image strikes, the glide slope angle can be determined. An appropriate signal is communicated to the pilot via a pair of indicator lights mounted on the runway depending upon whether the aircraft is above, below or on the desired glide slope angle. GRA

**THE IMPACT OF A TRAFFIC ALERT AND COLLISION AVOIDANCE SYSTEM ON THE AIR TRAFFIC CONTROL RADAR BEACON SYSTEM AND THE MODE S SYSTEM IN THE LOS ANGELES BASIN Final Report, 15 Jan. 1981 - 15 Jul. 1984**

May 1985 133 p refs Prepared in part for Electromagnetic Compatability Analysis Center, Annapolis, Md.
(Contract F19628-80-C-0042)
(FAA-PM-84-30; ECAC-PR-84-003) Avail: NTIS HC A07/MF A01

An analysis was performed to predict the impact of the Traffic Alert and Collision Avoidance System (TCAS) on the performance of selected air traffic control and surveillance systems in the Los Angeles Basin. The predictions involved the impact of minimum TCAS II (TCAS II M) on both the Air Traffic Control Radar Beacon System (ATCRBS) interrogator at Long Beach, and a hypothetical Mode S sensor at Los Angeles (LAX-4), as well as the impact of the combined TCAS I and TCAS II M signal environment on the Long Beach ATCRBS interrogator. These predictions were made using a hypothetical peak Los Angeles Basin airborne deployment and subsets of that deployment. Author

**PRELIMINARY HAZARD ANALYSIS FOR SELF-CONTAINED NAVIGATION SYSTEM**

J. T. REEVES 4 Oct. 1985 18 p
(Contract F09603-85-C-1224)
(AD-A161883; MISC-2037) Avail: NTIS HC A02/MF A01 CSCL 17G

This document constitutes the Preliminary Hazard Analysis (PHA) for the C-130 Self-Contained Navigation System (SCNS) installation. It provides an initial risk assessment of the SCNS installation. The purpose of the PHA is to identify safety critical areas, evaluate hazards, and identify the safety design criteria to be used. The items covered in this analysis are to be used during the design phase and trade-off study period to prevent unsafe concepts, designs, or oversights that could lead to incorporation of hazards in the hardware, the system operation, handling, and maintenance. The scope of this analysis for Data Item 0103 is limited to the SCNS installation task A-kit components (viz wiring harness, brackets, racks, control panels, relay boxes, circuit breakers), B-kit components (e.g., ICDUs, BICU, DVS, INU), and the physical interfaces with existing equipment (e.g., CADC or Sensors, Radar, Air Data Sensors). These items will be analyzed in respect to safe installation, safe hardware, and safe usuage (e.g., installation, removal, in-place test, and handling). GRA

**PROCEEDINGS OF THE 12TH BIENNIAL GUIDANCE TEST SYMPOSIUM HELD AT HOLLOMAN AFB, NEW MEXICO ON 22-24 OCTOBER 1985, VOLUME 1**

K. S. MORGAN, P. ROMANOWSKI, L. VALLOT, G. STEIN, and D. ENNS 15 Oct. 1985 252 p Symposium held at Holloman AFB, N. Mex., 22-24 Oct. 1985
(AD-A161996; AD-TR-85-54-VOL-1) Avail: NTIS HC A12/MF A01 CSCL 17G

These proceedings contain papers which were presented at the Twelfth Biennial Guidance Test Symposium. This symposium, hosted by the Central Inertial Guidance Test Facility, Holloman Air Force Base, New Mexico on 22 to 24 Oct. 1985, was directed toward the exchange of information, stimulation of new ideas, and discussion of current techniques associated with the development and evaluation of inertial guidance and navigation systems. The papers presented included such topics as new test and calibration techniques for accelerometers and ring laser gyros, advances in flight reference systems, new test equipment, and new software developments. Papers presented in the classified portion of the symposium are published as Volume 2. Critical technology papers are published as Volume 3. Author (GRA)

**AN APPARATUS FOR AND A METHOD OF DETERMINING COMPASS HEADINGS Patent Application**

D. G. JABLONSKI, inventor (to Navy) 24 Jun. 1985 12 p
(AD-D012051; US-PATENT-APPL-SN-748248) Avail: NTIS HC A02/MF A01 CSCL 17C

A compass system and method incorporating a global positioning system (GPS), such as the NAVSTAR/GPS multisatellite system, is configured to [illegible] accurate compass heading information without [illegible] by magnetic anomalies and without being [illegible] on the elapsed time since a previous position fix. The compass system comprises, inter alia, two antenna/preamplifiers located, for example, fore and aft a ship or aircraft separated by a predetermined distance d. A microprocessor/minicomputer portion of the system causes an electronic coaxial switch to switch a GPS receiver between the two antenna/preamplifiers automatically thereby measuring their absolute positions. The microprocessor/minicomputer computes and displays on a display unit a compass heading based on the knowledge of the absolute positions of the antenna/preamplifiers and the distance d there between. **THE APPLICATION OF FRACTURE MECHANICS METHODOLOGY TO THE DAMAGE TOLERANCE ANALYSIS OF THE BOEING 757 AIRPLANE**

S. RAO VARANASI (Boeing Commercial Airplane Co., Seattle, WA) IN: Advances in fracture research (Fracture 84). Volume 5 . Oxford and New York, Pergamon Press, 1986, p. 3469-3484. refs

The functions of fracture mechanics in the residual strength and damage growth elements of the damage tolerance analysis of aircraft structures are analyzed. The characterization of fracture resistance of a material with linear elastic fracture mechanics is examined. The use of the fracture mechanics method to evaluate crack growth by the stress intensity factor is described. The development of a structural inspection maintenance program to determine the type and frequency of inspections required to detect fatigue damage is studied. An example of the damage tolerance analysis of the 757 wingbox lower surface, displaying the applicability of the technique, is presented. I.F.

**UNDERSTANDING AND PREDICTING HELICOPTER BEHAVIOR - THEN AND NOW (LECTURE)**

A. GESSOW (Maryland, University, College Park) American Helicopter Society, Journal (ISSN 0002-8711), vol. 31, Jan. 1986, p. 3-28. refs

Theories and techniques used to understand and predict helicopter characteristics are reviewed. The Glauert and Lock momentum-blade element approach, the vortex theory, free-wake method, laser Doppler techniques, and laser holographs employed to explain rotor inflow and wake are described. The application of the inflow/wake theories to the prediction of hover performance is examined. Various ground and flight techniques for evaluating forward flight performance and blade load measurements are discussed. The analyses of aeroelasticity, stability and control, and noise are studied. I.F.

**A86-30550**

### LOGISTICS SUPPORTABILITY CONSIDERATIONS DURING CONCEPTUAL AND PRELIMINARY DESIGN

D. P. SCHRAGE and S. A. MEYER (Georgia Institute of Technology, Atlanta) Vertiflite (ISSN 0042-4455), vol. 32, Mar.-Apr. 1986, p. 48-51.

The concept formulation efforts of the 'light helicopter experimental' (LHX) program, which is based on improving combat effectiveness while reducing life cycle costs (LCCs), are described. The need to study logistic supportability considerations in the synthesis process of aircraft systems is examined. LCCs and logistic costs can be lowered by reducing: (1) the manpower required for support, (2) the cost of spares, (3) the reliance on test equipment, and (4) the cost of post development software support. Six systems for the LHX program aircraft that will lower LCCs are proposed. The economic and noneconomic benefits of the standarization of aircraft designs and the use of common components are studied. The development of a two-level maintenance system and the reduction of manpower are analyzed. The improvement of the reliability and maintainability of mission components and speed to insure self-deployability and sustainability of the aircraft is discussed. The elimination of automatic test equipment is examined. I.F.

**A86-31039**

### THE 7J7 - BOEING'S ANSWER TO THE AIRBUS A320

M. GRANGIER Interavia (ISSN 0020-5168), vol. 41, Feb. 1986, p. 151-153.

An evaluation is made of the design features, performance, and comparative economies of the '7J7' airliner that will compete with the A320 in the 150-seat aircraft market of the 1990s. The propulsion system currently envisioned for the 7J7 uses two counterrotating unducted fans in pusher configuration. Extensive use is to be made of aluminum-lithium alloys and thermoplastic matrix composites, with a view not only to the reduction of airframe weight but of manufacturing costs. The J7J is of approximately the same dimensions as the 727-200, although cabin cross section and wingspan will both be greater. O.C.

**A86-31221**

### COMING UP - THE 330 AND 340

A. PARTIOT Revue Aerospatiale (ISSN 0065-3780), March 1986, p. 12, 13, 15. In English and French.

The designs of the A330 and A340 are described. The A330 is a two-engined aircraft that has a 9300 km range and seats 310 passengers. A range of 12,000 km is provided by the four-engined A340. The operating cost savings possible with these aircraft due to weight reductions and new technologies are discussed. I.F.

**A86-31331#**

### X-29 REVIVES THE EXPERIMENTAL AIRCRAFT

J. N. ALLBURN, J. P. RETELLE, JR. (DARPA, Arlington, VA), N. J. KRONE (University Research Foundation, College Park, MD), and W. E. LAMAR Aerospace America (ISSN 0740-722X), vol. 24, Feb. 1986, p. 30-33.

The canard-equipped X-29 aircraft, although built to fighter specifications, is actually a demonstrator project for innovative aerodynamic, structural and flight control concepts. The aircraft has shown that aeroelastic tailoring of advanced composites eliminates divergence of a forward swept wing, resulting in high aerodynamic and structural efficiency at high lift, increased maneuverability, agility and potential STOL. The X-29 offers control at low speed and high angle of attack, and in production aircraft would mean reduced weight and systems cost, and increased range and payload. Basic research was required before flying while accommodating maneuvering variable camber with aft flaperons, full authority canards, high pitch instability and the use of digital flight controls to stabilize an inherently unstable aircraft. The thin wing section and the control laws for stabilizing the negative static margin were major design problems that have seemed solved within the flight test envelopes thus far explored. The program has demonstrated the strength of pre-flight engineering and simulation work, while underscoring the need for flight testing to explore flight regions that cannot be well-defined without hard data to verify and improve existing models. M.S.K.

**A86-31332#**

### UNUSUAL AERODYNAMICS OF X-29

G. SPACHT, J. CALANDRA, M. MOORE, T. TAGLARINE, J. CHIN (Grumman Corp., Aircraft Systems Div., Bethpage, NY) et al. Aerospace America (ISSN 0740-722X), vol. 24, Feb. 1986, p. 34-36, 38.

The X-29 is controlled by the pilot through the medium of a triple channel flight control system (FCS) which compensates for the 35 percent negative margin of stability of the aircraft. The aeroelasticity tailored forward-swept supercritical profile composite wings furnish lower wing profile drag during transonic maneuvering, compared to an aft-swept wings. Less drag is also present at low speeds and high angles of attack (AOA). Forward wing sweep confines separation to inboard regions to maintain attached flow at the wing tips, even at high AOA, when the full-span ailerons remain effective. Nose vortex shedding is symmetrical because of strakes which eliminate sideslip. Flow interaction between the canards and wings provides more lift for the canards at high AOA and canard downwash retards flow separation on the wings. The aerodynamic coefficients are maximized by variable camber and relaxed static stability. Three-surface trim is controlled by the multimode FCS, which can function reliably in various degraded modes, thus fulfilling a design goal of risk reduction. M.S.K.

### X-29 FLIGHT - ACID TEST FOR DESIGN PREDICTIONS

T. W. PUTNAM, K. L. PETERSEN, S. D. ISHMAEL, and W. J. SEFIC (NASA, Flight Research Center, Edwards, CA) Aerospace America (ISSN 0740-722X), vol. 24, Feb. 1986, p. 40-42.

The X-29 flight test data are being disseminated to interested industrial and military users as fast as it becomes available. The aircraft is extensively instrumented with accelerometers and pressure sensors and optical sensors for measuring wing deflection. The thoroughness of preflight preparations permitted a rapid advance through initial test checkpoints, which have both confirmed many predictions and revealed several discrepancies. The flight envelope had been expanded to Mach 1.1 and an altitude of 40,000 ft by December 1985. Notably, the X-29 has provided in-flight data which could not be faithfully depicted in a simulator, e.g., flare procedures during landing, and has shown that the stability adjustments, although adequate for controlling the aircraft, are not rapid enough to offer a satisfactory margin of harmony. The tests are now being performed in the transonic regime, where supercritical airfoil and forward swept wing drag reduction become significant factors. M.S.K.

**A86-31334#**

### X-29 AIMS AT APPLICATIONS

T. M. WEEKS (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) and T. J. WIERZBANOWSKI (USAF, Flight Test Center, Edwards AFB, CA) Aerospace America (ISSN 0740-722X), vol. 24, Feb. 1986, p. 44-46.

Once beyond high angle of attack (AOA) and transonic regime flight testing, the two X-29 research aircraft will be used to increase technology transition, expand the flight envelope of modern aircraft, for military development and testing and to incorporate and test improved or new technologies. A Committee has been established to facilitate the transfer of data from the program to government and industrial users. The ground and flight tests have furnished data on wing/canard flow interactions, structural aeroelastic effects, flutter and aeroservoelastic modes and excitation, analysis and testing techniques, flying qualities for superaugmented aircraft, and the effects of static instability. A jump strut may be tested on one of the aircraft in an attempt to shorten the necessary runway length. Also, a jet fuel-powered emergency power unit is being studied as an emergency power unit. Finally, the flight control system programming may be rewritten in ADA. M.S.K.

**A86-31336#**
**SOVIET AIRCRAFT CLOSE TECHNOLOGY GAP**
R. DEMEIS Aerospace America (ISSN 0740-722X), vol. 24, Feb. 1986, p. 56-59.

Soviet fighter design is generally ruled by the principle of evolutionary advances in proven practices and technologies. Aircraft designs are generated by indigenous talent and by concepts copied from the West. A centralized design bureau guides the efforts of separate design institutions, each normally devoted to producing a particular type of design. Cross-fertilization occurs between the different houses, e.g., delta wings onboth the MiG-21 and the Sukhoi Su-9. The aircraft are produced on a wartime basis, i.e., quantity, so ground maintenance crews are smaller to exploit the surplus of aircraft, which offsets a lack of quality or hardware sophistication. The turn-of-the-century MiG-2000 is projected to have a 500 n. mi. combat radius, a Mach 2.6 dash, GTO weight of 20 tons, and thrust/weight ratio of 1.35. Fuel consumption concerns will force the introduction of a large proportion of composite materials for structural parts. A digital avionics cockpit would have an inclined seat to permit 9 g maneuvers. The fighter would incorporate stealth technology and would carry sufficient armament for a kill on the first pass, in keeping with the historic requirements of Soviet aircraft for a high instantaneous turn rate but a deficiency in sustained turning.
M.S.K.

**A86-31341#**
**SWEDEN'S GRIPEN - A TOUGH BIRD TO TANGLE WITH**
R. DEMEIS Aerospace America (ISSN 0740-722X), vol. 24, March 1986, p. 52-55.

The JAS-39 Gripen design has been selected by the Swedish government as the nation's multirole fighter into the 21st century. It will have an airframe amenable for diverse missions, a modified version of the F404J engine, and maneuvering canards. One model of the aircraft will serve ground attack, two-seat trainer, fighter/interceptor and sea-surveillance roles, with adjustments between missions handled by reprogrammable digital avionics and a distributed on-board set of microprocessor-computers. The wing span will be 26 ft, length 46 ft, and GTOW of 18,000 lb without weapons, 22,400 lb with stores. The airframe will be 30 percent carbon composites, i.e., the wing, the vertical tail, canards, intake ducts and the landing gear doors. The thrust/weight ratio of takeoff will be 1. The JAS-39 is to have STOL capabilities from 500 m of rural roads widened to 550 ft. Thrust reversal will be obviated by using the canards to lift the nose for aerodynamic braking. Ease-of-repair features are to be built into the aircraft to facilitate reliability and maintainability when the aircraft is serviced by conscripts with a short service record. The Gripen will be statically unstable and flown by means of the computers, which will furnish the pilot with three CRT screens of data plus HUD. A 28 deg inclined seat will aid the pilot in sustained high-g turns. M.S.K.

**A86-31344**
**SU-27 - SUKHOI PLAYS ITS FLANKER**
B. SWEETMAN Interavia (ISSN 0020-5168), vol. 41, March 1986, p. 275-278.

A discussion is presented concerning the design features and probable performance characteristics of the USSR's Su-27 twin-engine fighter, which is comparable to the U.S.'s F-14 and F-15 and incorporates numerous configurational features of Western fighter aircraft. Among such details are a high visibility bubble canopy, strake/wing planform, blended wing/fuselage cross section, and an I/J-band coherent Doppler radar that may be based on F/A-18 APG-65 radar design data obtained through espionage. IR search-and-track and telescopic video sensors are also incorporated underneath the engine air intakes. The most perplexing aspect of the Su-27's design is the mission which it is required to accomplish; it is presently conjectured to be a long range 'intruder' aircraft. O.C.

**AEROSPATIALE AS.350 B1 - THE MOUNTAIN SQUIRREL**
M. LAMBERT Interavia (ISSN 0020-5168), vol. 41, March 1986, p. 289-292.

A design feature and performance evaluation is presented for the recently certificated B1 version of the AS.350 high altitude/hot atmospheric conditions helicopter for mountain terrain operations. Comparisons are made between the B1 and its mountain-optimized predecessor from the same manufacturer, the Lama; the B1 is noted to possess a more fuel-efficient engine and fly faster, therefore being able to accomplish more in a given period of time than a Lama despite its 100-kg smaller payload. Dimensions and operating parameters are presented. O.C.

**NEW INTERFACES IN THE COCKPIT**
M. LAMBERT Interavia (ISSN 0020-5168), vol. 41, March 1986, p. 295-297.

General aviation, military aircraft, helicopter and airliner flight decks are being transformed by three dynamically developing technologies: digital avionics, side stick controllers, and pilot voice control procedures. Attention is given to the 'Starship' executive tubes possessing their own symbol generators. Side stick controllers are considered ideal pilot interfaces with a fly-by-wire system such as that of the A320 airliner, clearing the pilot's line-of-sight to the windscreen and flight deck. Special usefulness is noted in the application of voice control technology to helicopters engaged in nap-of-the-earth operations. O.C.

**A STUDY OF THE EFFECT OF CERTAIN FACTORS ON THE FATIGUE STRENGTH OF STRUCTURAL IRREGULARITIES IN THE AIRFRAME OF AIRCRAFT [ISSLEDOVANIE VLIIANIIA NEKOTORYKH FAKTOROV NA DOLGOVECHNOST' KONSTRUKTIVNYKH NEREGULIARNOSTEI PLANERA SAMOLETA]**
N. V. KOSHELEV Samoletostroenie - Tekhnika Vozdushnogo Flota (ISSN 0581-4634), no. 51, 1984, p. 35-39. In Russian. refs

Problems associated with ensuring the fatigue strength of the airframe of an aircraft in irregular zones at the stage of design are examined. In particular, attention is given to factors determining the fatigue strength of typical joints, such as those securing the tip of a stiffness element to the skin and butt joints between skin panels, in relation to the design parameters. Practical recommendations concerning the selection of the joint size are given. V.L.

**PERIODIC CONTROL FOR MINIMUM-FUEL AIRCRAFT TRAJECTORIES**
W. GRIMM, K. H. WELL (DFVLR, Institut fuer Dynamik der Flugsysteme, Wessling, West Germany), and H. J. OBERLE (Hamburg, Universitaet, West Germany) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 9, Mar.-Apr. 1986, p. 169-174. refs

The problem of minimizing fuel consumption of an aircraft is formulated as an optimal control problem with periodic boundary conditions. Two problems are considered: one with constant aircraft weight and one with variable weight. Numerical solutions are computed via a multiple-shooting method and consist of bang-bang control actions for power setting. In comparison to the steady-state solutions, savings in fuel consumption for an F-4-type aircraft are approximately 2 percent. The solution obtained is shown to satisfy the second-order sufficiency conditions for a weak local optimum.

**COCKPITS FOR 2010 AND BEYOND**
P. I. SUMMERS (McDonnell Aircraft Co., St. Louis, MO) IEEE Aerospace and Electronic Systems Magazine (ISSN 0885-8985), vol. 1, Feb. 1986, p. 17-20.

A proposed cockpit design for fighter aircraft is described. The ground-based mission planning system is discussed. The use of a forebody concept to accommodate the physiological needs of the crew is examined. An armrest control module is proposed for controlling attitude and thrust. The encapsulation of the crew station and display systems such as the helmet mounted sight and display system are studied. The application of artificial intelligence and biocybernetics to the cockpit of the aircraft is analyzed. I.F.

**COMPARISON OF F-101 EJECTION SEAT AND ACES II STATIC AERODYNAMIC COEFFICIENTS**

L. J. SPECKER (USAF, Aerospace Medical Research Laboratory, Wright-Patterson AFB, OH) SAFE Journal, vol. 16, Spring 1986, p. 6-13. refs

High-speed ejection trajectories and accelerations remain unpredictable and low-speed ejections can be predicted only if the simulation program has been updated to reflect changes in ejection seat design and aerodynamic influencing factors. This paper describes the computer simulation model, the aerodynamic adjustments necessary to achieve correlation with test data, and the results obtained after a comparison was made between F-101 ejection seat and Advanced Concept Ejection Seat (ACES) II test data. It was found that the static aerodynamic coefficients of the F-101 were not similar to those of the ACES II when the seat reference point is used as the moment reference center. Moreover, each of the six static aerodynamic coefficients of the F-101 are significantly different from those of ACES II when measured in low-speed wind tunnel tests. It is concluded that static aerodynamic coefficients collected using the F-101 ejection seat cannot be used to calculate the performance of an ACES II when aerodynamic forces are predominant in the ejection sequence. K.K.

**NEW RESEARCH AIRCRAFT FOR DFVLR**

Dornier-Post (English Edition) (ISSN 0012-5563), no. 3, 1985, p. 15-17.

Features relating to the structure and performance of the Dornier 228 aircraft are described and a summary of future flight projects is given. The rectangular cabin (6.30 m long, 1.35 m wide, 1.55 m high) permits the simultaneous housing of different control, evaluation and recording devices as well as scientific pesonnel. Complex sensors which may be installed include MSS, SAR, SLAR, and SCAT. When flying at 1000 ft, the aircraft's noise level of 74.1 dB(A) is 5.9 dB(A) below the admissible limit, allowing for research missions over residential areas. Dornier 228 offers excellent low-speed flying characteristics around 100 km/hr as well as a high cruise speed with a maximum of 430 km/hr; and the use of a mobile oxygen system allows flight measurements up to an altitude of 25,000 ft. Because of this performance spectrum, the Dornier 228 is capable of such projects as the thermal mapping of temperature distribution in city regions and the monitoring of the ocean, forests, and the atmosphere. K.K.

**THE IA 63 TRAINER**

B. STRAETER and K. H. MOHR Dornier-Post (English Edition) (ISSN 0012-5563), no. 3, 1985, p. 29-31.

After three years of preparatory work, a first agreement on cooperation was signed in 1979 by the Argentine Air Force and Dornier GmbH for the development of the IA 63 basic/advanced jet trainer. The IA 63 is a single-engined jet trainer with a shoulder-mounted nonswept trapezoidal wing with a supercritical section. This wing, characteristic of the IA 63, was designed for a high maximum lift during takeoff and landing and fo low drag and high lift during cruise and in maneuvers. The tricycle landing gear with single wheels is suitable for landings on unpaved airstrips, and the seat position coupled with a one-piece cockpit canopy opening to the rear offers excellent visibility. The success of IA 63 prototypes in October 1984 and in August 1985 attests to its reliability in training missions, simplicity is maintenance, and inherent level of technological expertise. K.K.

**FLIGHT TEST OF A DECOUPLER PYLON FOR WING/STORE FLUTTER SUPPRESSION**

F. W. CAZIER, JR. (NASA, Langley Rearch Center, Hampton, VA) and M. W. KEHOE (NASA, Flight Research Center, Edwards, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 13 p. refs
(AIAA PAPER 86-9730)

The decoupler pylon is a NASA concept of passive wing-store flutter suppression achieved by providing a low store-pylon pitch frequency. Flight tests where performed on an F-16 airplane carrying on each wing an AIM-9J wingtip missile, a GBU-8 bomb near midspan, and an external fuel tank. Baseline flights with the GBU-8 mounted on a standard pylon established that this configuration is characterized by an antisymmetric limited amplitude flutter oscillation within the operational envelope. The airplane was then flown with the GBU-8 mounted on the decoupler pylon. The decoupler pylon successfully suppressed wing-store flutter thoughout the flight envelope. A 37-percent increase in flutter velocity over the standard pylon was demonstrated. Maneuvers with load factors to 4g were performed. Although the static store displacements during maneuvers were not sufficiently large to be of concern, a store pitch alignment system was tested and performed successfully. One GBU-8 was ejected demonstrating that weapon separation from the decoupler pylon is normal. Experience with the present decoupler pylon design indicated that friction in the pivoting mechanism could affect its proper functioning as a flutter suppressor. Author

**MODELING OF AIRCRAFT CRUISE PERFORMANCE USING ACCELERATION AND DECELERATION MANEUVERS - RESULTS AND APPLICATION**

T. R. YECHOUT (U.S. Air Force Academy, Colorado Springs, CO) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 11 p.
(AIAA PAPER 86-9735)

A flight test technique has been developed under NASA Dryden sponsorship to predict aircraft cruise performance characteristics. The technique used acceleration and deceleration maneuvers to define baseline aerodynamic and propulsion system characteristics which were then input to a performance modeling prediction program. Conventional stabilized 'speed power' tests, which are normally used for cruise performance definition, can comprise a large portion of the flight time in a program. A significant reduction in flight time was estimated using the performance modeling approach, with associated savings in cost and schedule. A 20-hour verification flight test program was accomplished using a Learjet Model 35 aircraft. Author

**X-29A FLIGHT FLUTTER DATA ANALYSIS BY ADVANCED METHODS**

M. L. RUSSO (Grumman Corp., Data Systems Div., Holtsville), M. P. HEALY, and M. P. BROCK (Grumman Corp., Aircraft Systems Div., Calverton, NY) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 11 p. refs
(AIAA PAPER 86-9737)

Because of the X-29 forward-swept wing experimental aircraft's novel structural dynamics, flight flutter testing is initially conducted without a shaker system; it is therefore necessary to estimate aircraft flutter parameters on the exclusive basis of random excited data. The approach presented uses a maximum likelihood parameter identification technique. A computer code, 'TASKX', employs an initial model together with flight data to make maximum likelihood estimates of the true aeroelastic model from which flutter parameters are extracted. Favorable results are obtained using TASKX to analyze fin, wing, and fuselage response measurements from the X-29. O.C.

**FLIGHT TEST TECHNIQUES USED FOR CARRIAGE LOAD MEASUREMENTS AT LARGE UNDERFUSELAGE STORE CONFIGURATIONS ON TORNADO COMBAT A/C**

F. J. RUDOLPH (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 11 p.
(AIAA PAPER 86-9755)

Flight tests have been carried out in order to measure the carriage loads associated with the Multi-Weapon Carriage System (MWCS) of the Tornado combat aircraft. In particular, carriage loads have been collected from large underfuselage stores in a container configuration (MW1), a quadruple store carriage system (QSC), and an aerial target system (DATS). Detailed descriptions of the loads instrumentation, calibrations, software preparations and tests techniques, are given, and the load measurement data are presented in graphic form. A line drawing illustrating the trajectory of the container system at the moment of jettison is provided. I.H.

**NATURAL LAMINAR FLOW FLIGHT EXPERIMENTS ON A TURBINE ENGINE NACELLE FAIRING**

C. J. OBARA (PRC Kentron, Inc., Hampton, VA), E. C. HASTINGS, J. A. SCHOENSTER, T. L. PARROTT, and B. J. HOLMES (NASA, Langley Research Center, Hampton, VA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 11 p. refs
(AIAA PAPER 86-9756)

Flight experiments are being conducted with the objective to investigate the interactions between acoustic disturbances and laminar flow in the flight environment. In the experiments, the laminar boundary layer on the nacelles will be exposed to discrete and broadband external noises, and the effect of varying noise levels and frequencies on the stability of the laminar flow will be studied. The present paper provides an overview of the complete project and a status report on the results which have been obtained. The flight experiment is conducted with the aid of a modified research aircraft. The phase I flight tests are concerned with a quick and simple determination of natural laminar flow (NLF) behavior on an engine nacelle. Attention is given to instrumentation, the acoustic noise source, flow visualization, and the test results. G.R.

**A86-32098#**

**SINGLE HEADING CLIMBS - AN ALTERNATE TECHNIQUE FOR DETERMINING PERFORMANCE**

A. J. DEPASQUALE and I. J. BAILLIE (Douglas Aircraft Co., Long Beach, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 5 p.
(AIAA PAPER 86-9757)

This paper presents an alternate flight technique for determining actual climb performance levels on jet transport category airplanes. The current technique requires demonstration of reciprocal heading crosswind climbs. The new technique requires only single heading climbs using an INS installation and adhering strictly to onboard stability monitoring criteria. This concept has been validated by reanalysis of previous test results from reciprocal heading crosswind climb demonstrations, and by use of stringent onboard stability monitoring criteria during the MD-83 program. FAA Draft Advisory Circular AC No. 25-XX accepts this concept as valid. It will reduce the current flight hours required to demonstrate actual climb performance levels by 50 percent, shorten test schedule time, and reduce the total man-hours spent in data analysis. Author

**DEVELOPMENT AND FLIGHT TESTING OF THE T-2 CONTROL CONFIGURED VEHICLE**

M. YASUE, A. TAKEKOSHI, H. KANNO, M. NAKAO, K. SHIBATA (Japan Defense Agency, Technical Research and Development Institute, Tokyo) et al. AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 10 p.
(AIAA PAPER 86-9763)

The design, development, and testing of the T-2 control configured vehicle (CCV) are described. Th installation of a triplex digital fly-by-wire (FBW) flight control system into the T-2 is analyzed. The components of the FBW control system and the modes of the CCV are examined. The flight testing of the T-2 CCV is studied; the four phases of the testing include: (1) system checkout/envelope expansion/preliminary evaluation, (2) handling qualities evaluation, (3) CCV mode evaluation, and (4) operational evaluation. The test data reveal that the flight control system reliability and handling qualities are satisfactory. The application of the CCV concept and FBW system to modern high performance aircraft is discussed. I.F.

**INTEGRATING THE PILOT INTO THE COCKPIT**

M. B. JOHNSTON and A. V. WOLFE (General Dynamics Corp., Fort Worth, TX) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 8 p.
(AIAA PAPER 86-9765)

The designing of cockpits to fulfill mission requirements is studied. The need for pilot-vehicle interface (PVI) is discussed. The objectives of the PVI Project Lead are examined. The use of simulation in cockpit design is described. Examples displaying the progression of cockpit design complexity and workloads are presented. I.F.

**A86-32103#**

**T-46A FLIGHT TEST RESULTS**

W. H. SHAWLER (Fairchild Republic Co., Edwards, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 5 p.
(AIAA PAPER 86-9766)

The handling qualities, one G and accelerated stalls, takeoff and landing characteristics, engine operation, and subsystems of the T-46 aircraft are analyzed. The configuration and capabilities of the T-46 aircraft are described; engine and flight control system designs are exmined. The test data reveal that improvements in the lateral and longitudinal trims, stall warning, and speed brake panels are required. The T-46 performance was compared to the 62 percent model aircraft, which is a composite aircraft weighing

842 pounds; good correlation of performance data is observed. I.F.

**FLIGHT TEST PLANNING AND PARAMETER EXTRACTION FOR ROTORCRAFT SYSTEM IDENTIFICATION**
J. C. WANG, M. Y. DEMIROZ (San Jose State University, CA), and P. D. TALBOT (NASA, Ames Research Center, Moffett Field, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 16 p. refs
(Contract NCC2-297)
(AIAA PAPER 86-9772)

The present study is concerned with the mathematical modelling of aircraft dynamics on the basis of an investigation conducted with the aid of the Rotor System Research Aircraft (RSRA). The particular characteristics of RSRA make it possible to investigate aircraft properties which cannot be readily studied elsewhere, for example in the wind tunnel. The considered experiment had mainly the objective to develop an improved understanding of the physics of rotor flapping dynamics and rotor loads in maneuvers. The employed approach is based on a utilization of parameter identification methodology (PID) with application to helicopters. A better understanding of the contribution of the main rotor to the overall aircraft forces and moments is also to be obtained. Attention is given to the mathematical model of a rotorcraft system, an integrated identification method, flight data processing, and the identification of RSRA mathematical models. G.R.

**A86-32108#**
**FLIGHT TEST SIMULATION OF THE T-46**
J. C. PICK (USAF, Edwards AFB, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 8 p.
(AIAA PAPER 86-9773)

This paper describes the development and structure of the T-46A flight test simulation at the U.S. Air Force Flight Test Center, and emphasizes two interesting aspects of the simulation: (1) an electrohydraulic force-feel system is driven by a digital computer to model a reversible flight control system; and (2) data for extremely high angles-of-attack are incorporated into the simulation in order to simulate aircraft stall, departure, spin, and recovery. The use of this simulation as a tool to make performance and flying qualities testing safer, more effective, and more efficient is also discussed. Author

**A86-32109#**
**F-14A LOW ALTITUDE HIGH ANGLE OF ATTACK SIMULATION AND FLIGHT TEST PROGRAM**
R. J. GOODMAN and P. E. CONIGLIARO (Grumman Corp., Aircraft Systems Div., Calverton, NY) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 11 p.
(AIAA PAPER 86-9774)

The loss of several F-14A aircraft in apparent spin-related accidents during 1976-79 has led to the initiation of a series of flight test programs to investigate the high angle of attack departure characteristics of this twin engine, variable-sweep fighter. A review is presented regarding the technical considerations in applying ground-based piloted simulation to support F-14A high angle of attack flight testing in general, and the Low Altitude Asymmetric Thrust Test Program, in particular. It is found that piloted simulation support is a necessary means of enhancing flight test safety, productivity, and data analysis. Attention is given to simulation model updates, simulation fidelity issues, simulation-flight test philosophy, simulation test planning and on-site support, simulation verification flight testing, and critical store configuration testing. G.R.

**A86-32112#**
**HOW TO MAKE SIMULATORS FLY LIKE AIRPLANES**
L. G. JANSSENS and T. MARSHALL (USAF, Wright-Patterson AFB, OH) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 9 p.
(AIAA PAPER 86-9777)

A new technique for generating simulation data packages from flight testing data is described. The use of a digital flight test data system, an intgrated math model, and a six-degree-of-freedom engineering simulation model is examined. The performance, propulsion, handling qualities, and stability and control characteristics of the test aircraft were measured, and the data was evaluated with the simulation data system. The procedure for measuring angle of attack and sideslip is discussed. Good correlation between flight test data and computer model simulation data is observed. I.F.

**A86-32113#**
**INVESTIGATION OF MAIN LANDING GEAR TIRE TEMPERATURES DURING TAXY-OUT AT HEAVY TAKE-OFF MASSES**
H. KERNER (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 8 p.
(AIAA PAPER 86-9778)

Main gear tire temperature behavior in the Tornado aircraft is evaluated. The procedures for measuring the tire bead temperature of 30 x 11.50 and 30 x 14.5 tires with 24 and 26 ply ratings are described. The effects of ambient temperature, taxi-speed, and brake activity are studied. The testing of the tires at 6 and 33 C reveals that the tire bead temperature is dependent on radiation and a linear relationship between tire temperature and ambient temperature is observed. Brake activity and taxi-speed data are compared to towing data; a higher tire bead temperature caused by taxi-speed is detected in the taxiing aircraft. The cooling behavior of the tires is analyzed. The data reveal that the 24 ply rating tire is applicable for aircraft with low masses and shorter turn-around times, and the 26 ply rating tire displays good performance due to improved stiffness and higher mass. I.F.

**A86-32115#**
**X-29 GROUND AND FLIGHT SUBSYSTEM TESTING**
E. TOBIASON and R. MCSHEA (Grumman Corp., Edwards, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 7 p.
(AIAA PAPER 86-9781)

The concept of a manned research aircraft dedicated to the single purpose of testing high-risk aerospace technology was revitalized with the X-29 Advanced Technology Demonstrator. The first flight with the X-29 was conducted on December 14, 1984. The flight test environment is considered along with the X-29 subsystem design, a subsystem description, test plans aspects of program development, Calverton ground test results, and initial flight testing. It is pointed out that as a result of the 32 flights flown to date, many of the original flight test objectives have been attained. Thus, the advanced technologies incorporated in the X-29 design have proven feasible in actual flight. G.R.

**A86-32116#**
**INFLIGHT EXCITATION OF THE F-16XL**
S. C. TIERNEY (USAF, Flight Test Center, Edwards AFB, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 6 p.
(AIAA PAPER 86-9782)

During flight testing of the General Dynamics F-16XL fighter aircraft, a 2.5 Hertz oscillation in the aircraft longitudinal axis was encountered in the 0.90-0.95 Mach range at all altitudes. This oscillation was not predicted on the contractor simulator, which utilized flight test derived aerodynamics and a model of the flight control computer. Flight testing identified the amplitude of the oscillation to be system gain-dependent in the longitudinal axis.

The inflight excitation test procedure was developed to obtain the aircraft frequency response inflight, utilizing the actual hardware and aerodynamics at any condition within the flight envelope. Inflight excitation test results indicated a high gain system in the longitudinal axis, with -180 degrees of phase angle in the frequency range where the longitudinal oscillation existed. A gain nonlinearity in the aircraft actuators was identified as a major contributor to the limit cycle oscillation. The test procedure discussed has potential application to future aircraft with augmented flight controls by reducing flying qualities test time and increasing the level of safety involved in opening an aircraft flight envelope. **IN-FLIGHT FLOW VISUALIZATION OF F-106B LEADING-EDGE VORTEX USING THE VAPOR-SCREEN TECHNIQUE**

J. E. LAMAR, R. A. BRUCE, J. D. PRIDE, JR., R. H. SMITH, P. W. BROWN (NASA, Langley Research Center, Hampton, VA) et al. AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 10 p. refs

(AIAA PAPER 86-9785)

A flight program was conducted with the objective to study the vortex flow systems existing around the F-106B aircraft. Level 1-G decelerating flight with varying angle of attack was considered along with conditions involving G levels in the range from 4.5 to 5.5 and angles of attack in the range from 16 to 19 degrees. It was demonstrated that the vapor screen technique can be applied successfully to flight vehicles under a variety of test conditions, taking into consideration the transonic maneuver performed by fighter aircraft. Details regarding the employed in-flight flow visualization technique are discussed, taking into account the seeding system, the light sheet system, the video system, the control system, and the recording of the data. Attention is also given to the flight program, the data development, and the scientific observations. G.R.

**A86-32119#**

**CONSTANT ALTITUDE HELICOPTER FLIGHT TESTING**

D. M. LAYTON (Per Safe, Salinas, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 6 p.

(AIAA PAPER 86-9787)

Helicopter performance is evaluated using conventional and constant altitude testing. The equations for induced, profile, parasite, and tail rotor powers, which are needed to sustain a single main rotor helicopter in level, unaccelerated forward flight, are presented; in order to maintain a constant coefficient of power a constant weight/density ratio is required. The relations between fuel consumption, pressure, altitude, temperature, and density ratio values are analyzed. The procedures for the constant altitude technique are described. Light and heavy weight helicopters performance was measured at a constant altitude; accurate density ratio values that correlate well with conventional testing data were obtained. I.F.

**A86-32132#**

**HIGH TECHNOLOGY TEST BED PROGRAM**

C. B. PAYNE (Lockheed-Georgia Co., Marietta) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 10 p.

(AIAA PAPER 86-9803)

The High Technology Test Bed (HTTB) program, initiated in 1984, is concerned with the addition of performance-enhancing design features to a Hercules test aircraft which facilitate Short Takeoff and Landing (STOL) capabilities and generally enhance tactical cargo mission survivability. Advanced electronics, avionics and cockpit designs are incorporated. Attention is given to the 'tactical assault mission' threat scenario which furnishes the context for HTTB design requirements. The new cockpit incorporates a cockpit management system, a HUD, programmable displays, and an autothrottle. A 'Special Avionics Mission Strap-On Now' pod is used to enhance mission adaptability. O.C.

**EXPERIENCE WITH FLIGHT TESTING INTEGRATED AVIONICS SYSTEMS**

F. E. PARLINI and J. R. COMBLEY (Boeing Commercial Airplane Co., Seattle, WA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 6 p.

(AIAA PAPER 86-9804)

The development and testing of the Boeing aircraft integrated digital Flight Management System (FMS) is discussed. On the 747, the INS was followed by the engine thrust limit computer, which led to the Performance Management System, which was then interfaced with the INS, autopilot and autothrottle to provide lateral/vertical navigation FMS capability. Digital avionics follow ARINC 700 and 429 specifications, and include the use of a Mark 33 Digital Information Transfer System. Integrated system testing involves both laboratory testing, including the employment of an engineering flight simulator, and inflight testing, including the use of the PADDS data recording system for troubleshooting on customer aircraft. A flight test bus has also proved useful in providing outputs of internal signals, and a navigation performance program has been developed for data analysis purposes. R.R.

**TORNADO AVIONIC FLIGHT TESTING**

E. PEARSON (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 7 p.

(AIAA PAPER 86-9805)

The avionic flight testing of the IDS (interdiction and strike) Tornado, a variable wing, fly-by-wire, multiweapon aircraft capable of treetop penetration in all weather conditions, is described. Following avionic subsystem development, and testing aboard two Buccaneer aircraft, Tornado prototypes were flight tested in England, Germany and Italy. The test reference system for the navigation tests employed a combination of an external surveillance radar and vertical photography with aircraft attitude compensation. Weapon aiming testing used release point assessments, and ballistic constants were measured by kinetheodolite tracking. The terrain following/autopilot-flight director testing objective of 200-ft set clearance height/0.9 Mach flight, was achieved in instrument meteorological conditions in 1985. R.R.

**SPECIFIC EXCESS POWER APPLICATIONS FOR ROTARY WING AIRCRAFT**

C. A. PARLIER (McDonnell Douglas Helicopter Co., Mesa, AZ) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 7 p. refs

(AIAA PAPER 86-9810)

Traditional rotary wing flight test techniques emphasize basically static performance parameters. As a result, there is a void in the empirical data obtained for helicopters. The lack of dynamic performance data has been highlighted by efforts to increase the fidelity of flight simulation models and smart flight control systems, as well as the pilot's understanding of the maneuvering capability of the aircraft. Specific excess power (Ps) test techniques can be used to partially fill-in the data voids which presently exist. Author

**CLOUD PARTICLE EFFECTS ON LAMINAR FLOW IN THE NASA LEFT PROGRAM - PRELIMINARY RESULTS**
R. E. DAVIS, M. C. FISCHER (NASA, Langley Research Center, Hampton, VA), D. F. FISHER, and R. YOUNG (NASA, Flight Research Center, Edwards, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 11 p. refs
(AIAA PAPER 86-9811)

Laminar flow offers the promise of significant fuel savings on future commercial transport aircraft, but laminar flow can be lost while encountering clouds or haze at cruise conditions. To quantify the effect of cloud particles on laminar flow during typical airline operating conditions, and evaluate candidate cloud particle detection instrument concepts for future laminar flow aircraft, two types of cloud particle detectors are being flown aboard a NASA JetStar aircraft in the Leading Edge Flight Test (LEFT) program. The instrumentation is described, and preliminary results and conclusions are presented. Author

**BIRD IMPACT TESTING AT AEDC'S RANGE S-3**
V. CENTONZE and N. M. SCHMOEKER (USAF, Arnold Engineering Development Center, Arnold Air Force Station, TN) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 8 p.
(AIAA PAPER 86-9818)

The considered facilities for bird impact testing consist of three parts, including the driver, the launch tube, and the concrete test pad. The driver has the objective to accelerate the bird to the desired launch velocity. It contains a 31-ft-long chamber with an 8-in.-diameter bore, and a volume of 10.8 cu ft. The launch tube is a 120-ft-long tube comprised of two rigidly mounted sections. A covered concrete test pad, where the target and its associated instrumentation are housed, constitutes the outdoor portion of the range. The test operations are discussed, taking into account the projectile, sabots, sabot strippers, test instrumentation, velocity measurement, deflection measurements, and strain, acceleration, pressure, and temperature measurements. Attention is also given to planned facility improvements, test projects, and aircraft component testing. G.R.

G. R. BEITEL and R. K. MATTHEWS (Calspan Corp., Arnold Air Force Station, TN) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 8 p. refs
(AIAA PAPER 86-9824)

A supersonic rain simulation environment to test the impact of rain and ice on aircraft and missile airframes has been developed. The ice particles are suspended in a liquid nitrogen carrier and injected into the tunnel upstream of the nozzle. During laboratory tests of the injection system, 500-micron ice particles were discharged at rates up to 500,000 particles per sec for durations up to 60 seconds. The characteristics of a particulate cloud prior to impact with the test article were determined using a laser diagnostics system; particle velocities were measured using a laser Doppler velocimeter. A detailed description of the calibration test program for the simulator is given. I.H.

**A REVIEW OF COMPUTER SIMULATIONS FOR AIRCRAFT-SURFACE DYNAMICS**
G. R. DOLE, JR. (Dayton, University, OH) Journal of Aircraft (ISSN 0021-8669), vol. 23, April 1986, p. 257-265. USAF-sponsored research. refs

Techniques for the dynamic simulation of aircraft-surface operations are examined. The computer programs are designed to predict gear loads, structural response, and soil behavior for aircraft traversing bomb damage repaired runways or manuevering on soil. The capabilities and limitations of the programs are described. The range of simulation codes from linear, single-degree-of-freedom models to nonlinear three-dimensional models with flexible airframe modes is studied. The validation of the codes is discussed. The use of time-domain analysis to predict catastrophic failure is investigated. I.F.

**A NUMERICAL ANALYSIS FOR VERTICAL GUST FIELD INDUCED BY GUST GENERATOR**
Y. YANG and J. WANG (Northwestern Polytechnical University, Xian, People's Republic of China) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 187-193.

This paper presents a calculating method for vertical gust field induced by gust generator which consists of a group of oscillating vanes based on subsonic unsteady lifting surface theory. When the geometry of the gust generator, oscillating frequency and amplitude, Mach number are given, the unsteady downwash field can be determined. In the calculation, the interference among the vanes are considered. Through numerical calculation, the characteristics of the vertical gust field induce by one, two, or three vanes with various reduced frequencies and Mach numbers are investigated. The influence of the gust generator on the characteristics of the vertical gust field are discussed, and some profitable conclusions for gust wind tunnel design are also obtained. Author

**EXPERIMENTAL TRANSONIC PRESSURE DISTRIBUTIONS OF A FLEXIBLE WING-AILERON MODEL AND COMPARISONS WITH RESULTS OF SEVERAL THEORETICAL METHODS**
D. GUAN, W. LIU, Z. GAO, and Y. ZHANG (Shenyang Aircraft Corp., People's Republic of China) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 211-218.

Analytical methods for the prediction of transonic load distribution due to large aileron deflection angle on a flexible wing were investigated. A 60-deg delta wing model with representative stiffness level and deflected aileron was tested in a high speed wind tunnel and pressure distributions were measured. Second-order transonic small disturbance theory, linearized aerodynamic theory and an empirical method based on rigid model pressure distributions were used to calculate the load distribution. It seems that the empirical method is more powerful. Author

**STATIC AEROELASTIC ANALYSIS USING AIRCRAFT VIBRATION MODES**
Z. SHEENA and M. KARPEL (Israel Aircraft Industries, Ltd., Lod) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 229-232.

A method for the calculation of the airload distribution and aeroelastic effectiveness parameters of a flexible aircraft from the distribution of a rigid one, using its vibration modes, is presented here. The traditional methods of solving problems involving static aeroelasticity use the discrete model of an aircraft. Such a model usually has hundreds of degrees of freedom. The method presented here uses modal data of the model in the form of a limited number of low frequency mode shapes and their associated generalized stiffnesses. The mathematical operations in this case are done on the generalized matrices of the model which have a small number of degrees of freedom. The uniqueness of this method is in its capability to calculate the static aeroelastic properties of a free-free aircraft using its elastic, inertial and aerodynamic properties. Another advantage of this method is that it is suitable for making parametric analyses involving changes in the stiffness of the structure and the aerodynamics of the model. Numerical examples are given and the convergence with the number of modes taken into account is discussed. Author

### A REVIEW OF AEROELASTIC RESEARCH AT THE FLIGHT DYNAMICS LABORATORY

T. M. HARRIS, T. E. NOLL, T. J. HERTZ, and W. A. SOTOMAYER (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) IN: International Symposium on Aeroelasticity and structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 233-243. refs

Development history and current development status evaluations are conducted for the primary research areas in the field of aeroelasticity that have been investigated by the Flight Dynamics Laboratory of the U.S. Air Force's Wright Aeronautical Laboratories. There areas are: (1) aeroservoelasticity, developing tools for the aeroelastic analysis of aircraft when active feedback control systems are taken into account; (2) adaptive flutter suppression, for aircraft carrying external stores; (3) the effect of external stores carriage on body freedom flutter for forward swept wings; and (4) three-dimensional transonic unsteady aerodynamic codes. O.C.

### SELECTED TOPICS IN EXPERIMENTAL AEROELASTICITY AT THE NASA LANGLEY RESEARCH CENTER

R. H. RICKETTS (NASA, Material and Structures Div., Washington, DC) IN: International Symposium on Aeroelasticity and structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 244-256. Previously announced in STAR as N85-30364. refs

The results of selected studies that have been conducted by the NASA Langley Research Center in the last three years are presented. The topics presented focus primarily on the ever-important transonic flight regime and include the following: body-freedom flutter of a forward-swept-wing configuration with and without relaxed static stability; instabilities associated with a new tilt-rotor vehicle; effects of winglets, supercritical airfoils, and spanwise curvature on wing flutter; wind-tunnel investigation of a flutter-like oscillation on a high-aspect-ratio flight research wing; results of wing-tunnel demonstration of the NASA decoupler pylon concept for passive suppression of wing/store flutter; and, new flutter testing methods which include testing at cryogenic temperatures for full scale Reynolds number simulation, subcritical response techniques for predicting onset of flutter, and a two-degree-of-freedom mount system for testing side-wall-mounted models. ### AEROELASTIC WIND TUNNEL SIMILARITY THEORY FOR ANISOTROPIC AIRCRAFT WINGS

G. A. OYIBO (Fairchild Republic Co., Farmingdale, NY) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 257-264. refs

An examination of the fundamental aeroelastic equations of motion for anisotropic aircraft wings, with the help of affine transformations, indicates that a unified aeroelastic simulation theory can be formulated which reduces to the current theory in the isotropic limit. The necessary condition for preserving the Strouhal number between the real aircraft wing and its wind tunnel model is found to lie in the preservation of the generalized forms of the similarity parameters suggested by Theodorsen and Garrick (1940), as well as new parameters reflecting the various directional and coupling stiffness properties of anisotropic materials in a given aerospace structure. The use of these analysis results should significantly improve the understanding of previous wind tunnel data on anisotropic aircraft wings. O.C.

### THE CHOICE OF TECHNIQUES USED FOR FLIGHT FLUTTER CLEARANCE WITH PARTICULAR REFERENCE TO THE BAE 146 AND BAE 125

A. G. WOODS (British Aerospace, PLC, Civil Div., Hatfield, England) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 265-275. refs

Decisions must be made during the design of an aircraft regarding the most appropriate flight test method to be used to obtain flight flutter clearance. These decisions must be made in sufficient time to allow for the design and manufacture of test equipment, also for writing and testing the associated analysis programs. This paper discusses the background to the choice of techniques to be used, with special reference to the recently completed flight flutter tests of the BAe 146 feeder liner and the BAe 125 Series 800 executive jet. Details of the chosen methods of excitation, recording and analysis are given for these aircraft, with typical results. Author

### EXPERIENCE WITH AEROELASTIC ANALYSIS OF A SINGLE ENGINE TURBO TRAINER USING FINITE ELEMENTS METHODS

M. J. REINICKE, A. S. TURI (Pilatus Aircraft, Ltd., Stans, Switzerland), and A. VOLLAN (Omega GmbH, Immenstaad, West Germany) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 286-296.

PILATUS' experience with the aeroelastic analysis of a single engine Advanced Turbo Trainer is presented. Thence a aconcept is worked out for current and future applications. The present aeroelastic analysis is based on theoretical approach using finite element methods. Dynamic analysis results are validated by comparison with those from ground vibration tests of a similar structure. MSC/NASTRAN solutions were used for both dynamic and aeroelastic analysis. Rigid Formats were extensively altered to achieve higher flexibility. CPU time requirements were drastically reduced by the use of a NASTRAN DMAP program allowing parametric variation of modal mass, stiffness and damping. Calculated flutter results are compared with those from flight test. Author

### THE APPLICATION OF PRACTICAL OPTIMIZATION TECHNIQUES IN THE PRELIMINARY STRUCTURAL DESIGN OF A FORWARD-SWEPT WING

E. LERNER (Grumman Aerospace Corp., Bethpage, NY) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 381-392. refs

In the mid-seventies, a renewed interest in forward-swept wings stemmed from the emergence of advanced composite materials for use in lifting-surface design. At about that same time, investigators in the field of structural optimization were suggesting automated procedures for achieving least-weight designs of surfaces subjected to aeroelastic as well as strength requirements. This paper describes the application of optimization technology in preliminary design studies that preceded the full development of the Grumman X-29, forward-swept-wing, demonstrator aircraft. A review is given of finite-element resizing methods that were developed to satisfy optimality criteria for strength and divergence-velocity constraints. Application of the methods in an initial feasibility study of a variable-sweep wing and, later, in a more-detailed, fixed-wing design study are described. The usefulness of the methodology at various stages of design is demonstrated by tracing the process that led to the selection of an efficient cover-laminate configuration. Author

**A86-33257**
**STRUCTURAL OPTIMISATION PROGRAMS AND METHODS**
A. J. MORRIS (Cranfield Institute of Technology, England) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 393-406. refs

Attention is given to current practices in the CAD generation of minimum weight structure designs. The definition of design variables essentially fixes the form of the objective function; the remainder of the design problem is defined by the constraints limiting the range of values to be taken by the design variables in order to describe a realistic and safe structure. In the case of aircraft, loads are complex and give rise to a nonconservative system, due to the transmission of forces to the structure as a function of the deformed position and the structural/aerodynamic damping. O.C.

**A86-33258**
**VARIATION OF ANISOTROPIC BEHAVIOUR IN STRUCTURAL OPTIMIZATION**
G. HORNUNG, D. W. MATHIAS, and H. ROEHRLE (Dornier GmbH, Friedrichshafen, West Germany) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 407-414.

The 'gradient method' optimization procedure is presented with attention to results obtained by it for the optimization of a laminate composite wing box structure by which all design constraints are satisfied and weight is at its minimum. Prescribed restrictions in this procedure are restraints with respect to the failure of the laminate layers and the minimum thickness of the layers. The first part of the optimization process selects appropriate fiber orientations for a given structure under a given load; the second part improves this configuration by varying layer thicknesses until optimum design is obtained. O.C.

**A86-33259**
**TAILORING METHODOLOGY FOR AEROELASTIC STABILITY AND LATERAL CONTROL ENHANCEMENT**
T. A. WEISSHAAR (Purdue University, West Lafayette, IN) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 415-425. refs

Aeroelastic tailoring introduces directional stiffness into an aircraft structural design to control static or dynamic aeroelastic deformation so that aerodynamic and structural performance is affected in a beneficial manner. Utilization of the tailoring concept is often suggested, but has not been widely applied. This paper illustrates the problems and the potential of aeroelastic tailoring. Passive stability enhancement is shown to involve a compromise since. for fixed-root airfoils, maximizing flutter speed tends to minimize divergence speed and vice versa. Specific examples are included in the paper and involve both forward swept wing (FSW) and aft swept wing configurations. Nondimensional tailoring parameters are identified, independent of actual laminate geometry. The problem of tailoring for lateral control effectiveness is also reviewed for sweptback wings. Author

**A86-33261**
**ANISOTROPIC WING AEROELASTIC THEORIES WITH WARPING EFFECTS**
G. A. OYIBO and J. H. BERMAN (Fairchild Republic Co., Farmingdale, NY) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 434-440. refs

The aeroelastic equivalent of the aerodynamic similarity rule is used in an investigation of the influence of warping (spanwise axial constraints on wing twist) on anisotropic wing aeroelastic oscillations. The results obtained indicate that a high aspect ratio anisotropic wing should behave aeroelastically as a low aspect ratio wing, and vice-versa. Similarity parameters are derived and it is noted that the parameter currently used to determine when warping becomes significant is inaccurate for the case of anisotropic wings. The correct parameter is presented. O.C.

**A86-33263**
**EFFECTS OF ANISOTROPIC DESIGN ON THE STATIC AEROELASTICITY OF A SWEPT WING**
M. PIENING (DFVLR, Institut fuer Strukturmechanik, Brunswick, West Germany) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 451-456. refs

By exploiting the directional stiffness properties of composite materials coupling between different deformation modes can be achieved. The capability to apply this potential as design parameter is generally known as AEROELASTIC TAILORING. Although the utilization of the tailoring concept is often suggested in the context with the renewed interest in a forward swept wing it is generally applicable to improve the aircraft performance within the flight envelope. A simple structural idealization is adopted to model an arbitrary swept anisotropic wing of moderate to high aspect ratio. The related differential equations are solved for the deformations and internal forces by multiple shooting. The divergence speed is calculated by searching the lowest eigenvalue of the structural matrix formed from the transfer matrices of the wing sections and the according boundary conditions. Some parametric evaluations are performed. Author

**A86-33264**
**AEROELASTIC PROBLEMS AND STRUCTURAL DESIGN OF A TAILLESS CFC-SAILPLANE**
J. SCHWEIGER, O. SENSBURG (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany), and H. J. BERNS (Braunschweig, Technische Universitaet, Brunswick, West Germany) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 457-467. refs

Current structural optimizations programs, such as FASTOP and TSO, are presently applied to the redesign of a carbon fiber-reinforced composite tailless sailplane configuration. These programs obtained optimum reinforcing fiber orientations and stiffness distributions that met both aeroelastic and strength requirements. Flutter speed was doubled as a result of the design changes identified by this work, which encompassed wing root geometry modifications, a new main spar design, and the use of a novel, high modulus fiber type. O.C.

**A86-33267**
**STRUCTURAL DYNAMIC ASPECTS OF ROTOR NODAL ISOLATION**
J. STOPPEL (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 486-494.

Attention is given to the practical test results obtained in recent work with the antiresonance isolation system for helicopters designated 'ARIS'; this passive nodal isolation system employs an antiresonant frequency that is tuned to the main rotor passage frequency to prevent the transmission of the oscillatory hub forces and moments to the fuselage. Finite element methods are presently used to model the effectiveness of an ARIS for the case of the BK 117 helicopter. In this way, both eigenvalue analysis and frequency response potential vibration problems can be predicted. O.C.

**A86-33280**
**DETERMINATION OF NATURAL VIBRATION PROPERTIES OF A WING WITH WINGLET BY EXPERIMENTAL MODE SYNTHESIS TECHNIQUE**
S. N. GU, W. J. YOU, and J. S. JIANG (Northwestern Polytechnical University, Xian, People's Republic of China) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 605-611. refs

Electrical measurements and laser time-averaged holographic interferometry supplemented by sand-contour methods are used to determine the nine lowest natural frequencies and their corresponding natural modes on a wing with winglet. The six lowest natural modes of the wing and the three lowest ones of the winglet are orthogonalized, and a three-dimensional quantitative analysis and orthogonalization of the three lowest natural modes are carried out. Also noted are a method for controlling the density of fringes on images reconstructed from the time-averaged holograms, and an analytical method for the orthogonalization of measured modes. O.C.

(AD-D011999; US-PATENT-APPL-SN-788189) Avail: NTIS HC A02/MF A01 CSCL 13E

An aircraft window clamping ring is used to hold an optical sensor window against an aircraft wall. The ring has a plurality of cantilevers having upper contacts that bear directly down on the window. Because of the flexibility in the vertical direction, thermal expansion is compensated for by movement of the cantilevers. Horizontal expansion of the window creates no additional stress because the upper contacts bear perpendicular to possible horizontal movement. The cantilevers can be designed to preload the window to take into account maximum thermal expansion. Author (GRA)

**MORE ON NEW IL-96, IL-114 AIRCRAFT**
V. INOZEMTSEV *In its* USSR Report: Transportation (JPRS-UTR-86-004) p 9-11 12 Mar. 1986 Transl. into ENGLISH from Nedelya (Moscow, USSR), no. 46, 11-17 Nov. 1985 p 8
Avail: NTIS HC A05/MF A01

The development of the Ilyushin Aircraft IL-96, the long range Russian airbus, is discussed. The airbus is reminescent of the IL-86, however, its dimensions are larger and the wing span is almost 10 m greater, and the tail fin is 2 m higher. The IL-96 is a two-decked aircraft, which can hold 300 passengers. The lower deck houses 15 standard baggage handling containers. The IL-96-300 is designed to make long flights, with two or three landings in a day. The design of the 60 seat IL-114 passenger turboprop is also described. Its cruising speed is 500 km/hr, and has two multiblade gas turbine engines. It has high aircraft efficiency. It has built-in ramps. It serves short and medium distances. E.A.K.

**IMPROVED Y-7, Y-12 AIRCRAFT DESCRIBED**
S. BU *In its* China Report: Science and Technology (JPRS-CST-86-007) p 27-29 20 Feb. 1986 Transl. into ENGLISH from Hangkong Zhishi (Beijing, China), no. 12, Dec. 1985 p 3
Avail: NTIS HC A04/MF A01

The improved designs of the Y-7 and Y-12 aircrafts are described. The electronic equipment on the Y-7 was converted. The equipment included: environmental control system, atmospheric data system, ultrashortware radio station, magnetic navigation reference and attitude reference system, Omega navigation system, weather radar, guidance system, ranging device, and bearing receiver. The noise level was reduced. The interior of the Y-12 was changed and noise and vibration were reduced. The exterior was coated with high quality paint. E.A.K.

**DETAILS OF Y-121 STOL AIRCRAFT PRESENTED**
Z. SONG *In its* China Report: Science and Technology (JPRS-CST-86-007) p 30-32 20 Feb. 1986 refs Transl. into ENGLISH fdrom Hangkong Zhishi (Beijing, China), no. 12, Dec. 1985 p 4-5
Avail: NTIS HC A04/MF A01

The Y-121 is a newly developed, twin-engine turboprop, short take-off and landing multifunction airplane. It can be used for transportation, parachuting and for various applications in geology, agriculture and forestry; it can also be converted into a special-purpose airplane for precision search operation. The development design features, and technical performance of the Y-121 STOL aircraft are described. E.A.K.

The Helix and Felix standard loading sequences for the main rotors of helicopters with articulated and semirigid rotors respectively are described. The definition of Helix and Felix, statistical content according to different counting methods, and the results of fatigue tests used to assess them are outlined. The defined form of the two standards is given in full length and shortened versions. The method of generation is extremely simple, although a considerable amount of data is required for the generation algorithm. A FORTRAN program for this purpose, together with complete data tables in the correct format, are presented. Author (ESA)

**LIGHTNING PROTECTION GUIDELINES AND TEST DATA FOR ADHESIVELY BONDED AIRCRAFT STRUCTURES Final Report**
J. E. PRYZBY and J. A. PLUMER Washington NASA Jan. 1984 175 p refs
(Contract NAS1-15884)
(NASA-CR-3762; NAS 1.26:3762; LT-83-155) Avail: NTIS HC A08/MF A01 CSCL 01C

The highly competitive marketplace and increasing cost of energy has motivated manufacturers of general aviation aircraft to utilize composite materials and metal-to-metal bonding in place of conventional fasteners and rivets to reduce weight, obtain smoother outside surfaces and reduce drag. The purpose of this program is protection of these new structures from hazardous lightning effects. The program began with a survey of advance-technology materials and fabrication methods under consideration for future designs. Sub-element specimens were subjected to simulated lightning voltages and currents. Measurements of bond line voltages, electrical sparking, and mechanical strength degradation were made to comprise a data base of electrical properties for new technology materials and basic structural configurations. The second hase of the program involved tests on full scale wing structures which contained integral fuel tanks and which were representative of examples of new technology structures and fuel systems. The purpose of these tests was to provide a comparison between full scale structural measurements and those obtained from the sub-element specimens. Author

**MINIMUM TIME AND FUEL FLIGHT PROFILES FOR AN F-15 AIRPLANE WITH A HIGHLY INTEGRATED DIGITAL ELECTRONIC CONTROL (HIDEC) SYSTEM**
E. A. HAERING, JR. and F. W. BURCHAM, JR. Jun. 1984 25 p refs
(NASA-TM-86042; H-1242; NAS 1.15:86042) Avail: NTIS HC A02/MF A01 CSCL 01C

A simulation study was conducted to optimize minimum time and fuel consumption paths for an F-15 airplane powered by two F100 Engine Model Derivative (EMD) engines. The benefits of using variable stall margin (uptrim) to increase performance were also determined. This study supports the NASA Highly Integrated Digital Electronic Control (HIDEC) program. The basis for this comparison was minimum time and fuel used to reach Mach 2 at 13,716 m (45,000 ft) from the initial conditions of Mach 0.15 at 1524 m (5000 ft). Results were also compared to a pilot's estimated minimum time and fuel trajectory determined from the F-15 flight manual and previous experience. The minimum time trajectory took 15 percent less time than the pilot's estimate for the standard EMD engines, while the minimum fuel trajectory used 1 percent less fuel than the pilot's estimate for the minimum fuel trajectory. The F-15 airplane with EMD engines and uptrim, was 23 percent faster than the pilot's estimate. The minimum fuel used was 5 percent less than the estimate. Author

**AFTER ACTION REPORT, CH-47 RECOVERY USING D-PAAC Report, 13 - 21 Jul. 1985**
Jul. 1985 29 p
(Contract DAAK70-85-C-0014)
(AD-A161935) Avail: NTIS HC A03/MF A01 CSCL 13B

On 12 July 1985, a request was made for use of the D-PAAC in a recovery operation for a crashed CH-47D, which had crashed in a fish and wildlife management area on the New Jersey shore near the Delaware river. Recovery operations were to be conducted with minimal damage to the environment and as quickly as possible. This report will cover the period from 13 to 21 July and will address the period in three sections. The first will cover preparation and movement from Duck, N.C., to Chester, Pa. The second will cover preparation at Chester, Pa., and movement to the crash site. The third will cover operations at the crash site and movement out of the area. The D-PAAC operated on cushions at all times. the concept of using air cushion craft for heavy lift recovery operations in terrain which offers no other accessibility was partially validated. Also, the feasibility of towing an air cushion vehicle over water by conventional tug in an inland waterway operation was proven. It must also be concluded that improved propulsion means are required as well as some self-recovery capability (on-board winch) to improve useability of future craft similiar to the D-PAAC. GRA

29 Nov. 1985 48 p
(Contract F41-411)
(AD-A161936; NRLMR-5676) Avail: NTIS HC A03/MF A01
CSCL 01C

The effects of electrostatic charging on the CH-53E helicopter were examined. Measurements were made over a clean runway and over sandy terrain in basically desert conditions where electrostatic charging is known to be a problem. While the measured charging current (up to approx. 75 microAmp) and open circuit voltages (up to approx. 140 kV) cannot be claimed as maximum values attainable by the CH-53E, they show that the CH-53E is affected by electrostatic charging in much the same way as all other helicopters. Furthermore the range of data recorded in these tests has allowed us to formulate a model for the electrostatic charging of a hovering helicopter in both clean air and sandy air situations. This model is consistent with our own data and recorded prior experience with electrostatic charging of helicopters. It predicts that the CH-53E can readily attain short circuit currents of approx. 300 microAmp and open circuit voltages of approx. 400 kV. GRA

**THE US ARMY'S LHX (LIGHT HELICOPTER FAMILY) PROGRAM Final Report, 1983 - 1984**
W. L. HARRIS, J. BLAIR, G. F. DECKER, and R. L. MCDANIEL
Dec. 1984 50 p
(AD-A161949) Avail: NTIS HC A03/MF A01 CSCL 01C

Observations, analysis, conclusions and recommendations of the AHSG on selected critical issues related to the Army's LHX aircraft program are described. The basis of LHX, LHX program management, technology risk assessment, speed, and one versus two-man flight crew are discussed in the initial sections of this report. These issues constitute the more fundamental aspects of the Army's LHX program which were reviewed by the AHSG. Primary and secondary conclusions and recommendations are presented. Finally, a discussion of specific technologies and Army aviation programs is given in the appendices to this report. The discussion of each of these technologies and programs includes the AHSG's recommendations and conclusions on the same. A set of attachments follows the appendices. GRA

NTIS HC A07/MF A01 CSCL 01C

A preliminary design investigation has been performed to develop weight and cost sensitivities of various landing gear systems for a 10,000-pound class LHX helicopter. Weights are established for three baseline main landing gear systems: a noncrashworthy retractable, a crashworthy retractable, and a crashworthy fixed. Each system is capable of kneeling the LHX helicopter. Weights are based on preliminary structural analysis of landing gear loads developed by a computer program KRASH. KRASH was used to obtain the design loads at various sink rates, and pitch and roll attitudes. The design loads were used to size the landing gear structure in order to develop the landing gear weight for the different impact conditions. Main landing gear system costs are developed from the weight data established. An aerodynamic drag assessment was performed. Criteria for crashworthy designs are recommended. The recommended criteria were developed from the weight trends, costs, and UH-60A Class A Mishaps. GRA

**ANALYSIS AND VERIFICATION OF THE ICING SCALING EQUATIONS. VOLUME 1 Final Report, 1 Aug. 1981 - 31 Mar. 1984**
G. A. RUFF Nov. 1985 80 p Sponsored by Air Force
(AD-A162226; AEDC-TR-85-30-VOL-1) Avail: NTIS HC A05/MF A01 CSCL 17B

The formation of ice on aircraft surfaces occurs during flight through supercooled droplets. Ice accretions on these surfaces usually degrade both aircraft performance and operational safety. For this reason, it has become important in the design and certification phases of system development to evaluate system performance degradation because of icing. A research program was conducted to evaluate the icing scaling requirements. The objectives of the study were (1) to evaluate the equations governing the icing process to identify proposed scaling parameters, (2) to develop a computer code to solve the various forms of the icing scaling equations, (3) to conduct tests to determine which, if any, of the proposed methods produced scale ice accretions, and (4) if an accurate set of icing scaling equations were found, to write a final computer code that could be used in icing tests. The scaling verification tests were conducted using full and half-scale circular cylinders and full, 1/3, and 1/6-scale airfoil sections. GRA

**N86-23774#** Joint Publications Research Service, Arlington, Va.
**ROLLOUT OF XT-4 INTERMEDIATE CLASS TRAINING AIRCRAFT**
*In its* Japan Report: Science and Technology (JPRS-JST-86-007) p 1-5 25 Mar. 1986 Transl. into ENGLISH from Aerospace Japan (Tokyo, Japan), Jun. 1985 p 31-33
Avail: NTIS HC A04/MF A01

The completion of an XT-4 intermediate class training aircraft is reported. The XT-4 is a high-performance training aircraft produced entirely in Japan. The work of matching its engine and airframe will begin and the airframe will be subjected to functional tests. It will then be subjected to in-house tests and it will be delivered to the Defense Agency and tested for 2 years. Its scheduled completion is set for 2 years. The XT-4 has excellent flight characteristics at a wide variety of speeds. It is equipped with transonic wings, and the airframe shape is modified. The XT-4 is a training aircraft, and is scheduled to be used for flight training, however, it is an excellent aircraft with performance and characteristics suitable for Japan's needs. It is outstanding for rate of climb and range performance. E.A.K.

## AIRCRAFT INSTRUMENTATION

Includes cockpit and cabin display devices; and flight instruments.

**A86-29864#**
**EVALUATION OF FORMATS FOR AIRCRAFT CONTROL/DISPLAY UNITS**
T. L. MANN and L. A. LEIKER (Lockheed-Georgia Co., Marietta) IN: Symposium on Aviation Psychology, 3rd, Columbus, OH, April 22-25, 1985, Proceedings . Columbus, OH, Ohio State University, 1985, p. 135-142. refs

In this preliminary study of the definition of an optimal control/display unit display format design which will ensure effective and efficient human performance in the cockpit environment, subjects visually searched alphanumeric displays for a single unit of information and indicated when it was found. Data was thus collected on the accuracy of information retrieval, as well as the elapsed time to isolate the information; ten formats of two information densities each were evaluated, each of which contained labels and associated data for typical flight data and communications data. The results obtained indicate that both format design and density affect operator response time and accuracy. Implications of these findings are discussed. O.C.

**A86-30312#**
**FLUIDIC GYRO SYSTEMS**
T. B. TIPPETTS (Garrett Corp., Garrett Pneumatic Systems Div., Tempe, AZ) IN: Symposium Gyro Technology 1985; Proceedings of the Symposium, Stuttgart, West Germany, September 24, 25, 1985 . Stuttgart/Duesseldorf, Universitaet Stuttgart/Deutsche Gesellschaft fuer Ortung und Navigation, 1985, p. 13.0-13.51. refs

Fluidic gyroscopic technology can operate under conditions so severe as to prohibit any alternative form of stability augmentation; it, in addition, possesses reliability, storability, and cost benefits over those alternatives that render it applicable to low cost strap-on systems for bombs, direct fire rockets, etc. Fluidic gyros are both EMI- and EMP-proof. Fluidic gyro output signals can be processed by fluidic amplifier, resistor and capacitor circuits, all of which are immune to EMP. Attention is given to applications, sensor operating principles, construction methods, and fluidic amplification/dynamic processing circuits. O.C.

**A86-30315#**
**A LASER-INERTIAL AIRBORNE SURVEYING SYSTEM**
J. W. HURSH (Charles Stark Draper Laboratory, Inc., Cambridge, MA) IN: Symposium Gyro Technology 1985; Proceedings of the Symposium, Stuttgart, West Germany, September 24, 25, 1985 . Stuttgart/Duesseldorf, Universitaet Stuttgart/Deutsche Gesellschaft fuer Ortung und Navigation, 1985, p. 17.0-17.23. refs

The recently developed Aerial Profiling of Terrain System (APTS) furnishes terrain profiling and other survey data at current accuracy standards and with substantial savings in time and field work. APTS incorporates a three-gimbaled inertial platform to indicate aircraft position in three coordinates; a two-axis laser tracker mounted on a common base acquires and follows prelocated retroreflectors in sequence, thereby supplying range and pointing data to update the navigation on the basis of ground truth. The laser profiler provides terrain clearance measurements which are combined with the highly accurate position data from the navigation, in postflight data reduction, to obtain ground profiles. Attention is given to the considerations that most influenced system configuration, as well as the design and fabrication of the APTS hardware. O.C.

**A86-31343**
**AIRBORNE RADAR - THE GREATER WATERSHED**
J. PELLANDINI Interavia (ISSN 0020-5168), vol. 41, March 1986, p. 263, 265.

Three major combat aircraft radar development efforts are currently underway in France: (1) 'RDM', a multifunction, multimode pulse Doppler radar that is fully digital and monopulse, and which employs a frequency-agile coherent transmitter to accomplish many different missions; (2) 'RDI', a pulse Doppler radar optimized for long range interception of oncoming targets at any altitude; and (3) 'Antilope 5', which is designed to allow either simultaneous or separate mapping and terrain following in low altitude penetration missions in all weathers. The present evaluation of these technologies gives attention to methods for the circumvention of electronic countermeasures through ever increasing processing rates for ever increasing quantities of data. O.C.

**A86-32099#**
**INSTRUMENTATION OF A LIGHT TWIN AIRCRAFT FOR FLOW ENERGIZER FLIGHT TESTS**
D. T. WARD and R. S. BINFORD (Texas A&M University, College Station) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 15 p. refs
(AIAA PAPER 86-9759)

Flow energizers represent small lifting surfaces which are added to an aircraft with the objective to alter local flow characteristics. Typically, flow energizers are simpler to manufacture than the fillets, fairings and cuffs which they replace. The present paper is concerned with flow energizers which involve very low aspect ratio configurations, usually having a highly swept leading edge of approximately 75 degrees. Attention is given to pressure port locations on the wind tunnel model, flow energizer terminology, basic flight instruments, angle of attack and sideslip angle, surface pressure instrumentation, wake flow field instrumentation, force and moment instrumentation, integration of instrumentation, pressure data results, wake survey results, and force and moment results. G.R.

**A86-32126#**
**THE NDS 2000 FLIGHT TEST INSTRUMENTATION SYSTEM IN THE F-20 TIGERSHARK**
B. DEMO (Northrop Corp., Hawthorne, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 8 p.
(AIAA PAPER 86-9797)

Northrop Flight Test has developed a modular, distributed, airborne data acquisition system, incorporating several unique technological advances. These include: digital signal processing of analog measurands; self-contained reference junction compensation and integrating A to D conversion for thermocouples; a module to embed compressed digitized voice in the data stream; and a flexible and powerful MIL-STD-1553 bus interface. Author

**A86-32128#**
**AFFTIS - WHAT NOW?**
M. F. LAMY (SCI Technology, Inc., Huntsville, AL) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 5 p.
(AIAA PAPER 86-9799)

The 'AFFTIS' flight test instrumentation system was developed after January of 1983 in order to meet the requirements of a standardized approach to aircraft flight test program data acquisition requirements. Although AFFTIS was cancelled in September of 1985, a number of prepossessing technologies and system concepts were developed by the time of termination; it is to these that attention is presently given. Design details and performance projections are presented for the AFFTIS 10-Mbit full duplex serial bus, the AFFTIS System Controller's programmable secondary outputs and integral data processor, data acquisition units, signal conditioning, and ground and laboratory support systems. O.C.

**A86-32140#**
**AIRBORNE INFRARED MEASUREMENT SYSTEMS AND TECHNIQUES**
W. G. KULLER and M. E. STEBLIN (USAF, Eglin AFB, FL) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 9 p. refs
(AIAA PAPER 86-9814)

Information regarding aircraft infrared signatures is now needed in the design of new weapon systems, and the determination of such signatures requires the conduction of measurements with airborne infrared instrumentation. This paper provides information regarding available airborne systems needed by the test community, taking into account the various test techniques used to employ them. Attention is given to the beam approach seeker evaluation system (BASES), a supersonic airborne infrared measurement system (SAIMS), upgrades to BASES, the Infrared Calibrated Airborne Spatial Measurement System (IR CASMS), a SAIMS upgrade, and the self-contained airborne system ASIMS. In a description of test techniques, aircraft/drones are considered along with flares, missile performance, countermeasures, end-game tracking, and the determination of seeker acquisition envelopes. G.R.

**A86-32144#**
**F-16 FLUTTER TESTING AT EGLIN AIR FORCE BASE**
C. A. DREYER and D. L. SHOCH (USAF, Eglin AFB, FL) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 7 p.
(AIAA PAPER 86-9819)

As combat aircraft reach higher operational limits, while incorporating lighter and less rigid materials in their structures, flutter testing assumes greater importance. Attention is presently given to the flutter flight testing program conducted for the F-16 fighter at the U.S. Air Force's Eglin Air Force Base Armament Division. The tests were conducted with external stores in order to establish external store carriage limits. The instrumentation installed in the test aircraft and the premission calibration procedures required to insure accuracy in the data obtained are described, together with the means by which external stores are instrumented. O.C.

**A PRELIMINARY DESIGN FOR FLIGHT TESTING THE FINDS ALGORITHM Final Report**
A. K. CAGLAYAN and P. M. GODIWALA Mar. 1986 85 p refs
(Contract NAS1-17719)
(NASA-CR-178043; NAS 1.26:178043; R8602) Avail: NTIS HC A05/MF A01 CSCL 01D

This report presents a preliminary design for flight testing the FINDS (Fault Inferring Nonlinear Detection System) algorithm on a target flight computer. The FINDS software was ported onto the target flight computer by reducing the code size by 65%. Several modifications were made to the computational algorithms resulting in a near real-time execution speed. Finally, a new failure detection strategy was developed resulting in a significant improvement in the detection time performance. In particular, low level MLS, IMU and IAS sensor failures are detected instantaneously with the new detection strategy, while accelerometer and the rate gyro failures are detected within the minimum time allowed by the information generated in the sensor residuals based on the point mass equations of motion. All of the results have been demonstrated by using five minutes of sensor flight data for the NASA ATOPS B-737 aircraft in a Microwave Landing System (MLS) environment. Author

**COMPARATIVE EVALUATION OF REDUNDANT FLIGHT DATA RECORDED BY A DIGITAL AIRBORNE INTEGRATED DATA SYSTEM RECORDER (DAR) ON BOARD AN AIRBUS A-310 AIRCRAFT**
O. WEBER and G. ROSENAU 1985 42 p refs
Avail: NTIS HC A03/MF A01

Flight data collected during scheduled Airbus A-310 flights by a Digital AIDS Recorder (DAR) were analyzed. The characteristics of the standard A-310 AIDS are compared to those of the A-300 AIDS. The A-310 reconstruction of the motion state of the aircraft is more complete than with the older equipment. The DAR A-310 permits a detailed and extensive check of the basic AIDS measuring channels through independently measured quantities. This check, however, is restricted to the measuring ranges encountered in normal flight conditions. It cannot be extrapolated to extreme flight conditions expected in accidents or incidents. In the flight conditions of the scheduled flights, the correspondence between basic AIDS measurements and quantities from the extended AIDS is very good. Author (ESA)

### MODELLING AN AXIAL FLOW COMPRESSOR IN STARTING OF A TURBOJET ENGINE

D. YAN (Beijing Institute of Aeronautics and Astronautics, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Oct. 1985, p. 467-473. In Chinese, with abstract in English. refs

A method of modelling an axial-flow compressor in low speed starting regime from windmilling to idling of an engine is presented. A structural formula for the model is established according to Deyou (1983). A method of step-by-step regression is proposed for determining the coefficient matrices of the structural formula. The coefficient functions are determined on the basis of the square, linear, and constant terms of the mass flow coefficient respectively in the mathematical model, while in each portion of the regression the rotor speed is considered to approach zero due to the feature of very low speeds. In results the model represents the performance of the compressor at low speeds very well. Good agreement is obtained between the computational and experimental results. Author

### EXPERIMENTAL INVESTIGATION ON FREQUENCY RESPONSE OF A TURBOJET ENGINE TO TURBULENCE-TYPE DYNAMIC DISTORTION

S. LIU, F. CHEN, W. LI, Z. WANG, and M. CONG (Northwestern Polytechnical University, Xian, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Oct. 1985, p. 484-488. In Chinese, with abstract in English.

The inlet and exit fluctuating pressure signals of a compressor prior to 'drift surge' are investigated by correlation and spectral analyses. It is found that the stochastic process of fluctuating pressure is no longer stationary near the inception of the 'drift surge'. The surge of the tested engine under the dynamic distortion is caused by rotating stall. The whole unsteady operating time for the engine to approach surging is about 5 seconds and the process is characterized by rotating stall cell spreading forward from the rear stage over the whole annular passage of the compressor. It is worth noticing that the tested engine is sensitive to pressure fluctuations with certain frequencies prior to the surge, but a strict conclusion needs further experimental investigation. ### HOW TO NOT EAT YOUR OWN DUST

B. FRISCH Aerospace America (ISSN 0740-722X), vol. 24, Feb. 1986, p. 18, 19.

Design techniques useful for configuring particle filters for turbine engine air intakes are discussed and illustrated with descriptions of hardware in use or under development. Inertial particle separators have shown promise for the best, and most acceptable, performance in terms of low maintenance, effectiveness and ease of deicing. Vaneless separators (VS) in particular also feature reduced erosion, weight and part count. Contoured walls direct incoming particles to a scavenger duct in VSs when the flow has to accelerate over a hump, then turn. Because of inertia the particles cannot make the turn and are thus scavenged in the direction they must take. CFD/CAD codes which encompass the separator geometry, flow characteristics and particle trajectories are being applied in designing VSs, which are now primarily of interest for the LHX helicopters. ### BATTLE OF THE HUSHKITS - ALL QUIETER ON WESTERN FRONT

P. TURK Interavia (ISSN 0020-5168), vol. 41, March 1986, p. 311-314.

A development and implementation status evaluation is made of engine noise reduction technologies aiming at compliance with the FAA's FAR 36 noise level standards for older airliners' powerplants. The 'hushkits' that have been developed for high bypass turbofan engines incorporate acoustic lining materials employing microporous mesh, a metallic perforated plate, a metallic honeycomb structure, and a metallic solid back skin. DC-8 and B-707 airliners have been the primary recipients of these treatments; it has been found that substantially different hushkit designs must be developed for every on of the engine-type/airframe combinations encountered in service. O.C.

### LONGITUDINAL COMBUSTION INSTABILITIES IN RAMJET ENGINES IDENTIFICATION OF ACOUSTIC MODES

J. E. CRUMP, K. C. SCHADOW (U.S. Navy, Naval Weapons Center, China Lake, CA), V. YANG, and F. E. C. CULICK (California Institute of Technology, Pasadena) Journal of Propulsion and Power (ISSN 0748-4658), vol. 2, Mar.-Apr. 1986, p. 105-109. refs
(Contract AF-AFOSR-80-0265; AF TASK A3103100)

Longitudinal combustion instabilities in liquid-fueled ramjet engines have been investigated with attention focused on determination of the acoustic mode structures. Detailed pressure measurements, including both amplitude and phase, were made at ten positions spanning the length of the engine. The experimental data have been analyzed using two linear acoustic models. Four distinct modes were observed for various inlet/combustor combinations. These results help identify the mechanisms exciting low-frequency pressure oscillations in ramjet engines. Author

### THE NASA MODERN TECHNOLOGY ROTORS PROGRAM

M. E. WATTS and J. L. CROSS (NASA, Ames Research Center, Moffett Field, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 13 p. refs
(AIAA PAPER 86-9788)

Existing data bases regarding helicopters are based on work conducted on 'old-technology' rotor systems. The Modern Technology Rotors (MTR) Program is to provide extensive data bases on rotor systems using present and emerging technology. The MTR is concerned with modern, four-bladed, rotor systems presently being manufactured or under development. Aspects of

MTR philosophy are considered along with instrumentation, the MTR test program, the BV 360 Rotor, and the UH-60 Black Hawk. The program phases include computer modelling, shake test, model-scale test, minimally instrumented flight test, extensively pressure-instrumented-blade flight test, and full-scale wind tunnel test. G.R.

### VERIFICATION OF THE THRUST AND AIRFLOW MODEL OBTAINED FROM THE PERFORMANCE MODELLING PROCESS

J. L. JORDAN and W. G. SCHWEIKHARD (Kohlman Systems Research, Inc. Lawrence, KS) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 7 p.
(AIAA PAPER 86-9790)

This paper demonstrates that the performance modeling method produces an engine performance model which compares faavorably with a calibrated engine deck produced by the manufacturer for a specific engine. An analysis shows that the employment of a thrust run corrected nominal engine model as a basis for a performance analysis represents a viable method. Attention is given to details concerning the engine modeling process, the calibrated engine process, the performance modeling process, ground static thrust runs, and flight test comparisons. G.R.

### DYNAMIC CHARACTERISTICS OF AN ASSEMBLY OF PROP-FAN BLADES

A. V. SRINIVASAN (United Technologies Research Center, East Hartford, CT), R. E. KIELB, and C. LAWRENCE (NASA, Lewis Research Center, Cleveland, OH) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 108, April 1986, p. 306-312. refs
(ASME PAPER 85-GT-134)

In contrast to conventional propellers, propfan blades are thin and highly swept-back, thereby giving rise to large bending and twisting deformations and complex vibratory characteristics. Aerodynamic performance depends on the extent of steady state deformation, and the aeroelastic response depends on the vibratory frequency and mode shape. Attention is presently given to the principal results of structural analyses for a five-bladed propfan assembly; these results are compared with test data. The results encompass both steady deformations and vibratory frequencies and mode shapes in a vacuum centrifugal environment. O.C.

### INFLUENCE OF FRICTION DAMPERS ON TORSIONAL BLADE FLUTTER

A. SINHA (Pennsylvania State University, University Park), J. H. GRIFFIN (Carnegie-Mellon University, Pittsburgh, PA), and R. E. KIELB (NASA, Lewis Research Center, Cleveland, OH) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 108, April 1986, p. 313-318. refs
(ASME PAPER 85-GT-170)

This paper deals with the stabilizing effects of dry friction on torsional blade flutter. A lumped parameter model with single degree of freedom per blade has been used to represent the rotor stage. The well-known cascade theories for incompressible and supersonic flows have been used to determine the allowable increase in fluid velocity relative to the blade. It has been found that the effectiveness of friction dampers in controlling flutter can be substantial. Author

### DYNAMIC ANALYSIS OF STRUCTURES WITH FLEXIBLE ROTORS

M. GERADIN and N. KILL (Liege, Universite, Belgium) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 477-485. refs

The paper describes the analytical tools developed for the structural dynamic analysis of machines with rotating parts such as aircraft engines. The finite element analysis is used for discretization, and the rotating parts are described using a three-dimensional formalism which includes in the kinetic energy expression the gyroscopic effects induced by the local changes of angular velocity produced by the deformation. The implementation of the formalism is specialized to the modelling of flexible rotors made of shafts and disks as it is typical for modern aircraft engines. The effectiveness of the component mode synthesis method to reduce the size of the system of equations is demonstrated in the specific case of systems made of rotating and fixed parts, governed by different sets of equations. Critical speed and stability analyses as well as unbalance response calculations are then performed by a sweeping procedure. As an illustration, the concepts presented are applied to the dynamic analysis of a high bypass ratio aircraft engine. Author

### IGNITER ELECTRODE LIFE CONTROL Patent Application

J. C. SCOTT, inventor (to Air Force) 7 Oct. 1985 11 p
(AD-D012007; US-PATENT-APPL-SN-784986) Avail: NTIS HC A02/MF A01 CSCL 11C

The prevention of electrode material erosion by undercutting in the outer electrode shell of igniter electrodes of jet engine ignition systems is prevented by the application of an electrical insulation coating. The coating is applied to the surface of the outer electrode shell which faces the ceramic insulation around the center electrode where erosion patterns are known to occur. The insulation material is selected from electrical insulation substances such as oxides of aluminum, tungsten, magnesium, beryllium or zirconium by choosing a non-porous electrical insulating substance with thermal expansion characteristics approximately equalling those of the outer electrode shell. Since a typical outer electrode shell is composed of 446 stainless steel, an optimum choice for the electrical insulation coating is $Al_2O_3$ deposited with a coating thickness of between 5 and 10 mils. ### STATUE OF AIRCRAFT ENGINE RESEARCH AT NPU REVIEWED

*In its* China Report: Science and Technology (JPRS-CST-86-004) p 40-45 28 Jan. 1986 refs Transl. into ENGLISH from Guoji Hangkong (Beijing, China), no. 10, Oct. 1985 p 4-6
Avail: NTIS HC A06/MF A01

The aircraft engine research work at Northwest Polytechnic University is intended to satisfy the needs of national defense and the aviation industry on the one hand, and to serve China's economic development on the other. The efforts were devoted to the following two areas: (1) exploring advanced design methods of high-performance propulsion systems, studying new topics in jet propulsion technology, developing our experimental capabilities and striving to improve measurement techniques; and (2) providing wide range of technical services to the mechanical, power, energy exploration and local industries in the areas of product design, application of new technologies, and development of new energy sources. Modern jet propulsion technology is closely tied to state-of-the-art scientific development and the development of electronic computers; it has evolved from a single technical discipline to the combined study of many different disciplines. The areas of research are discussed briefly. Author

**FRACTURE MECHANICS OF MULTIPLE CRACK INITIATIONS. AN APPLICATION FOR FRACTURE MECHANICS ANALYSIS OF GAS TURBINE ENGINE DISKS Interim Report, Feb. 1981 - Jun. 1983**
B. A. COWLES, A. B. THAKKER, and G. E. KING Oct. 1985 44 p
(Contract F33615-80-C-5160; DARPA ORDER 3993)
(AD-A162998; PW/ED/FR-18778; AFWAL-TR-85-4110) Avail: NTIS HC A03/MF A01 CSCL 21E

The purpose of this task was to investigate the current life prediction methodology for multiple crack growth in gas turbine engine components. To this end, experimental and analytical efforts were carried out. Current prediction methods for very small cracks (as small as 0.005 x 0.010 inches) were modified to address the larger interacting cracks produced by the controlled preflaw methods used in this program. The authors conclude that: (1) The modified crack growth life prediction technique currently in use resulted in acceptable but conservative predictions in all cases. Variability in the predictions was also acceptable and was similar to variability in predicted versus actual results for singular crack cases. (2) The multiple-degree-of-freedom approach also produced acceptable life predictions and, in fact, demonstrated reduced variability in predicted versus actual results. It was, however, more complicated to use and did not result in a consistent conservative bias in the life predictions. (3) Based on this study, the modified crack growth life prediction technique currently in use is considered adequate for Retirement-for-Cause applications. The multiple-degree-of-freedom approach offers potential improvements for future use. GRA

# AIRCRAFT STABILITY AND CONTROL

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**A86-30499*** National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.
**DIRECTIONAL HANDLING QUALITIES REQUIREMENTS FOR NAP-OF-THE-EARTH TASKS**
C. C. BIVENS (NASA, Ames Research Center; U.S. Army, Aeroflightdynamics Directorate, Moffett Field, CA) American Helicopter Society, Journal (ISSN 0002-8711), vol. 31, Jan. 1986, p. 37-42. refs

A piloted simulator experiment designed to investigate directional axis handling qualities requirements for low-speed and hover tasks conducted by a scout/attack helicopter is described. Included were the directional characteristics of various candidate light helicopter family (LHX) configurations. The test also focused on conventional single main/tail rotor configurations where the first-order effects that contribute to the loss of tail rotor control experienced by the OH-58 series aircraft were modeled. Two types of yaw stability and control augmentation systems were implemented: washed-out yaw rate feedback and shaped control input, and a yaw rate command, heading-hold system. The results of the experiment indicate that rotorcraft configurations with high directional gust sensitivity require more yaw damping to maintain satisfactory handling qualities during nap-of-the-earth (NOE) flying tasks. It was also determined that both yaw damping and control response are critical handling qualities parameters in performing the air-to-air target acquisition and tracking task. The lack of substantial yaw damping and larger values of gust sensitivity increased the possibility of loss of directional control at low airspeeds for the tail rotor configurations. Author

**THE AEROMECHANICS OF AIRCRAFT: FLIGHT DYNAMICS (2ND REVISED AND ENLARGED EDITION) [AEROMEKHANIKA SAMOLETA: DINAMIKA POLETA /2ND REVISED AND ENLARGED EDITION/]**
A. F. BOCHKAREV, ED. and V. V. ADREEVSKII, ED. Moscow, Izdatel'stvo Mashinostroenie, 1985, 360 p. In Russian. No individual items are abstracted in this volume. refs

A handbook for aviation students on the physics of flight is presented. Among the specific topics discussed are: the equations of motion governing aircraft in flight; aircraft trajectory calculations; and methods for calculating nonlinear or quasi-linear flight regimes. The issues of aircraft stability and control are addressed, with emphasis given to: aerodynamic moment calculations; static lateral stability; and stability constraints in nonlinear flight regimes. Topics concerning the dynamics of perturbed flight regimes are also discussed, including: pitching moment perturbations; corkscrew motion; and lateral moment perturbations. I.H.

**FREQUENCY-DOMAIN APPLICATION OF GAUSS-NEWTON METHOD TO EXTRACT AIRCRAFT LONGITUDINAL PARAMETERS**
S. C. RAISINGHANI (Indian Institute of Technology, Kanpur, India) and A. K. GOEL (Defence Research and Development Laboratory, Hyderabad, India) Aeronautical Journal (ISSN 0001-9240), vol. 90, Jan. 1986, p. 27-34. refs

The Gauss-Newton (GN) method is successfully applied in the frequency domain to extract aircraft longitudinal stability and control parameters from simulated flight data in calm air. Flight data at 128 points are generated and analyzed for six different types of elevator control inputs using the example of a business-jet aircraft. The initial values of the parameters are set arbitrarily at 0.5 to 1.5 times the true values to demonstrate the strength of the algorithm. Pseudorandom numbers are used to generate noisy data, and the present output error method is shown to yield good estimates even in the presence of high intensity measurement noise. It is demonstrated that the frequency-domain algorithm of the GN method is capable of giving better results as compared to the time-domain algorithm, and could achieve this in reduced computational time. R.R.

**INFLUENCE OF HIGH-ORDER DYNAMICS ON HELICOPTER FLIGHT-CONTROL SYSTEM BANDWIDTH**
R. T. N. CHEN (NASA, Ames Research Center, Moffett Field, CA) and W. S. HINDSON (Stanford University, CA) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 9, Mar.-Apr. 1986, p. 190-197. Previously announced in STAR as N85-21174. refs

The increasing use of highly augmented digital flight-control systems in modern military helicopters prompted an examination of the influence of the influence of rotor dynamics and other high-order dynamics on control-system performance. A study was conducted at NASA Ames Research Center to correlate theoretical predictions of feedback gain limits in the roll axis with experimental test data obtained from a variable-stability research helicopter. Feedback gains, the break frequency of the presampling sensor filter, and the computational frame time of the flight computer were systematically varied. The results, which showed excellent theoretical and experimental correlation, indicate that the rotor-dynamics, sensor-filter, and digital-data processing delays can severely limit the usable values of the roll-rate and roll-attitude feedback gains. R.J.F.

### AN INTERPRETATION OF AIRPLANE GENERAL MOTION AND CONTOL AS INVERSE PROBLEM

O. KATO and I. SUGIURA (Nagoya University, Japan) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 9, Mar.-Apr. 1986, p. 198-204. refs

A theoretical study for the inverse problem of the airplane general motion, that is, the problem of how an airplane should be controlled, when its flight maneuver is given, is described. An interpretation of this problem is made, and a general and practical method to solve the problem is developed. The distinctive features of this approach are to transform all the state variables of the airplane motion into the functions of the angle of attack alpha, sideslip angle beta and bank angle phi, and to pay special attention to the distinction between the flight-path angles and the flight attitude angles. By treating the triplet (alpha, beta, phi) as key variables it becomes easy to have insight into this complicated problem. This approach is applicable not only to conventional methods of motion and control but also to new and unusual methods through consideration of the degree of freedom of (alpha, beta, phi) for a given maneuver. A numerical calculation of an interesting flight maneuver is presented and discussed to illustrate the problem. Author

### FLIGHT INVESTIGATION OF A MULTIVARIABLE MODEL-FOLLOWING CONTROL SYSTEM FOR ROTORCRAFT

K. B. HILBERT, J. V. LEBACQZ (NASA, Ames Research Center, Moffett Field, CA), and W. S. HINDSON (Stanford University, CA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 14 p. refs
(AIAA PAPER 86-9779)

A high-bandwidth, multivariable, explicit model-following control system for advanced rotorcraft has been developed and evaluated on the NASA Ames CH-47B fly-by-wire helicopter. This control system has expanded the in-flight simulation capabilities of the CH-47B to support research efforts directed at the next generation of superaugmented helicopters. A detailed, analytical model of the augmented CH-47B has also been developed to support the flight tests. Analysis using this theoretical model was used to expose fundamental limitations caused by the basic vehicle characteristics and original control system implementation that had affected the performance of the model-following control system. Improvements were made to the nominal control system design to compensate for large time delays created by the higher-orderd dynamics of the aircraft and its control system. With these improvements, high bandwidth control and excellent model-following performance were achieved. Both analytical and flight-test results for the lateral axis are presented and compared. In addition, frequency-domain techniques are employed for documenting the system performance. Author

### MANAGEMENT CONTROLS ON THE X-29 FLIGHT-CONTROL SYSTEM SOFTWARE DEVELOPMENT

N. J. FURIA (Grumman Corp., Aircraft Systems Div., Bethpage, NY) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 8 p.
(AIAA PAPER 86-9808)

Software management systems for the X-29 forward-swept-wing aircraft are described. Emphasis is given to a description of the Operational Flight Program (OFP) controlling all aerodynamic surfaces on the aircraft. Other important functions of the OFP include built-in-test (BIT), redundancy management, and fault reaction. The OFP hardware consists of a triple-redundant dual processor. An air-data function controls the input of air-data parameters (static and dynamic pressure) which are used to calculate a predetermined set of gains for control of Mach number, altitude, and angle of attack. Verification and validation tests were accomplished by several independent engineering teams and independent review teams have been organized to assess the test coverage. A functional block diagram of the OFP top-level hierarchy is provided. I.H.

### DEVELOPMENT OF SPIN RESISTANCE CRITERIA FOR LIGHT GENERAL AVIATION AIRPLANES

D. J. DICARLO, H. P. STOUGH, III, K. E. GLOVER, P. W. BROWN, and J. M. PATTON, JR. (NASA, Langley Research Center, Hampton, VA) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 10 p. refs
(AIAA PAPER 86-9812)

A brief history of stall/spin technology for light general aviation airplanes is presented. Criteria needed to describe desirable characteristics of a spin-resistant airplane and means to evaluate airplanes for compliance with the criteria have been developed. Initial results from limited flight tests of an experimental high-wing airplane indicated that the basic configuration would not meet the spin resistance criteria. Further tests with the airplane modified to enhance its spin resistance are planned. Author

**A86-32146#**

### FIRST USE OF ADA IN FLIGHT-CRITICAL AVIONICS

M. D. BASS (McDonnell Aircraft Co., St. Louis, MO) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 7 p.
(AIAA PAPER 86-9822)

Ada higher-order computer software language was selected for application in an aircraft flight-critical avionic subsystem. The F-15 Control Augmentation System was modified from an analog system to a digital system, then programmed in Ada and tested throughout the aircraft flight envelope. This was the first use of Ada in flight hardware. The digital flight control system programmed in Ada performed nearly identical to the standard F-15 analog system. The suitability of Ada for use in military aircraft flight-critical avionics has thus been demonstrated. This paper discusses the test conduct and test results obtained, and describes the test aircraft modification. Author

**ADAPTIVE FLIGHT CONTROL OF UNSTABLE HELICOPTERS DURING TRANSITION**

H. OHTA, S. YOKOKURA (Nagoya University, Japan), P. N. NIKIFORUK, and M. M. GUPTA (Saskatchewan, University, Saskatoon, Canada) IN: A bridge between control science and technology. Volume 2 . Oxford and New York, Pergamon Press, 1985, p. 1045-1050. Research supported by the Ministry of Education of Japan. refs

(Contract NSERC-A-5625; NSERC-A-1080)

The design of an adaptive control system for a helicopter during transitional flight conditions is discussed. A mathematical model of the controlled plant and a model reference adaptive system (MRAS) is described. The identification speed and control performance of the system are examined. Simulation studies that reveal the problems associated with the identification and control techniques are presented. An adaptive algorithm based on MRAS and developed using the discrete Kalman filter is proposed. Stability derivative data are employed to predict the time-varying characteristics of the parameters. Examples displaying the applicability of the adaptive flight control system are provided. I.F.

**A86-33180**

**A DISCRETE ADAPTIVE OBSERVER FOR A MULTI-OUTPUT AIRCRAFT CONTROL SYSTEM**

N. HORI, P. N. NIKIFORUK (Saskatchewan, University, Saskatoon, Canada), and K. KANAI (Defense Academy, Yokosuka, Japan) IN: A bridge between control science and technology. Volume 2 . Oxford and New York, Pergamon Press, 1985, p. 1057-1062. refs

A state feedback system is described for controlling the longitudinal motion of an unknown aircraft using an adaptive observer applicable to multi-output systems. This observer is a simple extension of the single-output case and does not require the decomposition of the system. The design of the overall control system is, therefore, as simple as that for single-variable systems. For purposes of clarification, a singular control problem is investigated, but not the closed loop stability. Author

**A86-33246**

**FLUTTER CALCULATION BY A NEW PROGRAM**

V. J. E. STARK (SAAB-Scania AB, Linkoping, Sweden) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 276-285. Research supported by the Forsvaret Materielverk anad SAAB-Scania AB. refs

A new flutter and response program based on general equations of motion is described. The equations are solved by Laplace transformation and by mainly reducing the inversion integral to a sum of the residues at the poles at the zeros of the determinant. The resulting nonlinear eigenvalue problem, i.e. the problem of finding the zeros, is solved by using the Newton-Raphson formula combined with efficient numerical methods for calculation of the determinant and the principle of the argument for finding initial approximations. The program permits choice of different kinds of analytic functions in the linear approximation that is employed for approximating the aerodynamic transfer functions. Equations representing control laws of a flutter suppression system can be included. Author

**FINITE STATE MODELLING OF AEROELASTIC SYSTEMS FOR ACTIVE CONTROL APPLICATIONS - A GENERAL THEORY**

R. VEPA (Queen Mary College, London, England) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 309-319. refs

In this paper various techniques of modelling aeroelastic systems for active control applications are described. Three different approaches are available for this purpose and these are (1) the autonomous finite state approach (2) the time varying system approximation (3) the differential delay model. The differential delay model seems to be the simplest method of modelling aeroelastic systems. A design procedure for synthesizing optimal control laws for regulator design using the differential model is also briefly described. Author

**NLR EXPERIENCE IN THE APPLICATION OF ACTIVE FLUTTER SUPPRESSION AND GUST LOAD ALLEVIATION, APPLIED TO A WIND-TUNNEL MODEL**

P. A. VAN GELDER (National Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 320-329. Research supported by the Nederlands Instituut voor Vliegtuigontwikkeling en Ruimtevaart and Nationaal Lucht- en Ruimtevaartlaboratorium. refs

In 1981, the National Aerospace Laboratory of the Netherlands started a research program to study the aeroelastic effects of active control systems. Control laws for flutter suppression and gust load alleviation systems were developed and tested using an aeroelastic wind-tunnel model in a subsonic wind tunnel with the capability to simulate discrete or random gusts. Flutter suppression up to the maximum wind tunnel speed of 1.4 V(f) was achieved, while the gust load alleviation system reduced the wing root bending moment by 25 percent at 0.9 V(f) for simulated gusts with a Dryden spectrum. **WINDTUNNEL TEST AND LABORATORY SIMULATION OF A LOAD ALLEVIATION SYSTEM FOR A MODERN TRANSPORT AIRCRAFT**
H. G. GIESSELER and G. BEUCK (Messerschmitt-Boelkow-Blohm GmbH, Hamburg, West Germany) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 356-361.

MBB-UT has within the scope of government sponsored programs worked out the technological fundamentals for the development of an aircraft with a Load Alleviation System. The design and realization procedure, a possible sensor and actuating concept, the way how the control law was derived and a possible operational concept are explained. The design and mechanization of a digital LAS-controller is explained. The performance of the control law and of the digital hardware using a wind tunnel model is shown. A planned and partly realized laboratory simulation is presented, which enables us to verify the design conditions of the LAS in real hardware environment and using an aeroelastic model of the aircraft. **CONTROL LAW SYNTHESIS FOR GUST LOAD ALLEVIATION USING LINEAR QUADRATIC GAUSSIAN THEORY**
J. CHANG (Northwestern Polytechnical University, Xian, People's Republic of China) IN: International Symposium on Aeroelasticity and Structural Dynamics, 2nd, Aachen, West Germany, April 1-3, 1985, Collected Papers . Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, p. 362-367.

Linear quadratic Gaussian synthesis is presently applied to the design of a flexible aircraft's multiloop gust load alleviation system in which the one-dimensional vertical gust is approximately modelled as the output of a linear system with a stationary white noise process as the input. A technique yielding a minimal number of augmented states is presented, and, for all the coefficient matrices, a matrix least-squares formula is established. System states are estimated by means of a Kalman-Bucy filter observer, and a cost function involving the performance index of ride quality and control surface deflections with a weighting matrix is used. The time domain formula for the rms value of the normal acceleration associated with the aircraft response to gusts is given. O.C.

**INVESTIGATION OF THE DYNAMIC RESPONSE OF AIRCRAFT TO MICROBURST (JAWS) WIND SHEAR Ph.D. Thesis**
H. P. CHANG 1985 138 p
Avail: Univ. Microfilms Order No. DA8524117

A derivation of the governing equations of aircraft motion in variable wind field results in additional wind shear terms appearing in the force equations. Computer simulations of B727 type aircraft flying (landing and taking off) through the microburst (JAWS) wind shear data have been carried out and are in good agreement with those of the NASA/Ames B727 piloted simulator. The critical penetration heights through the center of the microburst are determined by computing the aircraft trajectory deviations from the intended flight path at the ILS Category 2 decision height window. It is found that the higher the magnitude of the wind gradient terms, the more influence they have on the aircraft performance, especially on sideslip angle, angle of attack, and rolling moment. The wind shear effects on three generic types of aircraft, a three-engine passenger airliner (PA), a twin-engines STOL (STOL), and an executive jet (EJ), are also investigated in this study. Dissert. Abstr.

**A METHODOLOGY FOR AIRPLANE PARAMETER ESTIMATION AND CONFIDENCE INTERVAL DETERMINATION IN NONLINEAR ESTIMATION PROBLEMS Ph.D. Thesis - George Washington Univ., Apr. 1985**
P. C. MURPHY Apr. 1986 56 p refs Revised
(NASA-RP-1153; L-16009; NAS 1.61:1153) Avail: NTIS HC A04/MF A01 CSCL 01C

An algorithm for maximum likelihood (ML) estimation is developed with an efficient method for approximating the sensitivities. The ML algorithm relies on a new optimization method referred to as a modified Newton-Raphson with estimated sensitivities (MNRES). MNRES determines sensitivities by using slope information from local surface approximations of each output variable in parameter space. With the fitted surface, sensitivity information can be updated at each iteration with less computational effort than that required by either a finite-difference method or integration of the analytically determined sensitivity equations. MNRES eliminates the need to derive sensitivity equations for each new model, and thus provides flexibility to use model equations in any convenient format. A random search technique for determining the confidence limits of ML parameter estimates is applied to nonlinear estimation problems for airplanes. The confidence intervals obtained by the search are compared with Cramer-Rao (CR) bounds at the same confidence level. The degree of nonlinearity in the estimation problem is an important factor in the relationship between CR bounds and the error bounds determined by the search technique. Beale's measure of nonlinearity is developed in this study for airplane identification problems; it is used to empirically correct confidence levels and to predict the degree of agreement between CR bounds and search estimates. **LOW-SPEED STABILITY AND CONTROL CHARACTERISTICS OF A TRANSPORT MODEL WITH AFT-FUSELAGE-MOUNTED ADVANCED TURBOPROPS**
Z. T. APPLIN and P. L. COE, JR. Apr. 1986 67 p refs
(NASA-TP-2535; L-16004; NAS 1.60:2535) Avail: NTIS HC A04/MF A01 CSCL 01C

A limited experimental investigation was conducted in the Langley 4- by 7-Meter Tunnel to explore the effects of aft-fuselage-mounted advanced turboprop installations on the low-speed stability and control characteristics of a representative transport aircraft in a landing configuration. In general, the experimental results indicate that the longitudinal and lateral-directional stability characteristics for the aft-fuselage-mounted single-rotation tractor and counter-rotation pusher propeller configurations tested during this investigation are acceptable aerodynamically. For the single-rotation tractor configuration, the propeller-induced aerodynamics are significantly influenced by the interaction of the propeller slipstream with the pylon and nacelle. The stability characteristics for the counter-rotation pusher configuration are strongly influenced by propeller normal forces. The longitudinal and directional control effectiveness, engine-out characteristics, and ground effects are also presented. In addition, a tabulated presentation of all aerodynamic data presented in this report is included as an appendix. Author

**EXTENSIONS TO PIFCGT: MULTIRATE OUTPUT FEEDBACK AND OPTIMAL DISTURBANCE SUPPRESSION**

J. R. BROUSSARD Mar. 1986 121 p refs
(Contract NAS1-17493)
(NASA-CR-3968; NAS 1.26:3968; IR-684105) Avail: NTIS HC A06/MF A01 CSCL 01C

New control synthesis procedures for digital flight control systems were developed. The theoretical developments are the solution to the problem of optimal disturbance suppression in the presence of windshear. Control synthesis is accomplished using a linear quadratic cost function, the command generator tracker for trajectory following and the proportional-integral-filter control structure for practical implementation. Extensions are made to the optimal output feedback algorithm for computing feedback gains so that the multirate and optimal disturbance control designs are computed and compared for the advanced transport operating system (ATOPS). The performance of the designs is demonstrated by closed-loop poles, frequency domain multiinput sigma and eigenvalue plots and detailed nonlinear 6-DOF aircraft simulations in the terminal area in the presence of windshear. **THE MEASUREMENT OF AIRCRAFT PERFORMANCE AND STABILITY AND CONTROL AFTER FLIGHT THROUGH NATURAL ICING CONDITIONS**

R. J. RANAUDO, K. L. MIKKELSEN, R. C. MCKNIGHT, R. F. IDE, A. L. REEHORST, J. L. JORDAN, W. C. SCHINSTOCK, and S. J. PLATZ 1986 46 p refs Presented at the 3rd Flight Testing Conference, Las Vegas, Nev., 2-4 Apr. 1986; cosponsored by AIAA, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE Prepared in cooperation with Kohlman Systems Research, Inc., Lawrence, Kansas
(NASA-TM-87265; E-2962; NAS 1.15:87265; AIAA-86-9758)
Avail: NTIS HC A03/MF A01 CSCL 01C

The effects of airframe icing on the performance and stability and control of a twin-engine commuter-class aircraft were measured by the NASA Lewis Research Center. This work consisted of clear air tests with artificial ice shapes attached to the horizontal tail, and natural icing flight tests in measured icing clouds. The clear air tests employed static longitudinal flight test methods to determine degradation in stability margins for four simulated ice shapes. The natural icing flight tests employed a data acquisition system, which was provided under contract to NASA by Kohlman Systems Research Incorporated. This system used a performance modeling method and modified maximum likelihood estimation (MMLE) technique to determine aircraft performance degradation and stability and control. Flight test results with artificial ice shapes showed that longitudinal, stick-fixed, static margins are reduced on the order of 5 percent with flaps up. Natural icing tests with the KSR system corroborated these results and showed degradation in the elevator control derivatives on the order of 8 to 16 percent depending on wing flap configuration. Performance analyses showed the individual contributions of major airframe components to the overall degration in lift and drag. Author

**ROBUSTNESS OF DISCRETE-TIME DYNAMICAL SYSTEMS: APPLICATION TO THE MULTIVARIABLE DIGITAL CONTROL OF COMBAT AIRCRAFT**

Y. JOANNIC Oct. 1985 266 p refs Transl. into ENGLISH of "La Robustesse des Systemes Dynamiques a Temps Discret: Application au Pilotage Numerique Multivariable des Avions d'Armes" Rept. ONERA-NT-1984-2 ONERA, Paris, France, 1984 Original language document was announced as N85-19986
(ESA-TT-906; ONERA-NT-1984-2) Avail: NTIS HC A12/MF A01

A method for computing optimal feedback laws, capable of maintaining accurate tracking despite constantly acting disturbances was developed and applied to flight control of combat aircraft. A formalism reduces robustness to preservation of stability in a properly augmented system. This leads to theoretical results which quantify the generalized structural robustness of a recurrent nonlinear multiple-loop system. After extending the Lyapunov criterion to systems having dynamical feedback, the classical concepts of stability margin and of gain and phase margins are generalized to the multivariable discrete case. Analytical expressions which enable margins to be evaluated when dynamical or nonlinear perturbations affect the feedback channels are given. By applying theorems on external stability to a recurrent system, the tolerable additive perturbations which do not destabilize the controlled system are quantified. Author (ESA)

**DEVELOPMENT EXPERIENCE WITH A SIMPLE EXPERT SYSTEM DEMONSTRATOR FOR PILOT EMERGENCY PROCEDURES**

M. VANNORMAN and D. A. MACKALL Feb. 1986 17 p refs
(NASA-TM-85919; H-1272; NAS 1.15:85919) Avail: NTIS HC A02/MF A01 CSCL 01C

Expert system techniques, a major application area of artificial intelligence (AI), are examined in the development of pilot associate to handle aircraft emergency procedures. The term pilot associate is used to describe research involving expert systems that can assist the pilot in the cockpit. The development of expert systems for the electrical system and flight control system emergency procedures are discussed. A simple, high-level expert system provides the means to choose which knowledge domain is needed. The expert systems were developed on a low-cost, FORTH-based package, using a personal computer. **ANALYSIS OF DATA FROM NASA B-57B GUST GRADIENT PROGRAM Final Report**

W. FROST, M. C. LIN, H. P. CHANG, and E. RINGNES Sep. 1985 500 p refs
(Contract NAS8-36177; NAS8-35347)
(NASA-CR-178736; NAS 1.26:178736) Avail: NTIS HC A21/MF A01 CSCL 01C

Statistical analysis of the turbulence measured in flight 6 of the NASA B-57B over Denver, Colorado, from July 7 to July 23, 1982 included the calculations of average turbulence parameters, integral length scales, probability density functions, single point autocorrelation coefficients, two point autocorrelation coefficients, normalized autospectra, normalized two point autospectra, and two point cross sectra for gust velocities. The single point autocorrelation coefficients were compared with the theoretical model developed by von Karman. Theoretical analyses were developed which address the effects spanwise gust distributions, using two point spatial turbulence correlations. B.G.

**ADVANCED CONCEPTS FLIGHT SIMULATION FACILITY**

S. L. CHAPPELL (Informatics General Corp., Moffett Field, CA) and G. A. SEXTON (Lockheed-Georgia Co., Marietta, GA) IN: Symposium on Aviation Psychology, 3rd, Columbus, OH, April 22-25, 1985, Proceedings . Columbus, OH, Ohio State University, 1985, p. 575-582.

Three identical Advanced Concepts Flight Simulation Facilities have been completed by NASA together with the Lockheed-Georgia Company. These simulation facilities, based on projected air travel needs and technology available for flight by 1995, have three components: (1) the Advanced Concepts Flight Station (ACFS); (2) an integrated air traffic control simulation; and (3) experimenter/observer stations. The ACFS is based on a hypothetical wide-body composite airframe propelled by two turbo-fan engines that has a range of 2500 miles and carries 200 passengers. The optimized airframe design produces a negative static margin and relies upon a three-axis stability augmentation system for manual aircraft control. Features incorporated into its components include: voice-operated cathode ray tube displays of flight systems information, clearance print-outs, cockpit traffic displays, current datebases containing navigational charts, fuel-efficient autopilot control from takeoff to touchdown, and an outside visual scene withy variable weather conditions. It has been shown that this cockpit is a versatile test-bed for studying displays, controls, procedures, and crew management in a full-mission context. K.K.

**A86-29917#**
**THE DEVELOPMENT OF AN ADVANCED HELICOPTER RESEARCH SIMULATOR**
F. J. MALKIN (U.S. Army, Human Engineering Laboratory, Aberdeen Proving Ground, MD) IN: Symposium on Aviation Psychology, 3rd, Columbus, OH, April 22-25, 1985, Proceedings . Columbus, OH, Ohio State University, 1985, p. 585-589.

A helicopter flight simulator is developed which will be used as a research tool through which advanced controls and displays, and varying levels of automation will be evaluated in terms of their impact on human performance. The part task and total crew station/system environment simulation investigations include display formats and side-arm flight control considerations. The crew station accepts a variety of display devices, and control input schemes including key pads, a thumb-controlled joy stick for maneuvering the display cursor, and a speech recognition device. A low-cost computer-generated image system video-projects images onto a large screen. The experimenter's console will be used in the development, monitoring, and result analysis of experiments. Applications include the development of the LHX. R.R.

**THE 'MINITUFT' SURFACE FLOW VISUALISATION METHOD - EXPERIENCE OF USE IN THE RAE 5M PRESSURISED LOW-SPEED WIND TUNNEL**
D. G. DOBNEY, P. HANSON, and S. P. FIDDES (Royal Aircraft Establishment, Aerodynamics Dept., Farnborough, England) Aeronautical Journal (ISSN 0001-9240), vol. 90, Jan. 1986, p. 10-17.

The development and use of a 'minituft' surface flow visualization technique in the RAE 5m Pressurized Low-Speed Wind Tunnel is described. The method, due to Crowder, uses very fine nylon monofilaments to show surface flow direction. These tufts are made visible by coating them in a fluorescent dye and then illuminating them with a powerful ultra-violet light source. Because of their small size, a large number of tufts may be used without interfering with the flow to a great extent. However, it is shown that if accurate force measurements are required, then it is advisable to test the model in the absence of tufts. Author

**A86-31847*#** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
**THE NATIONAL TRANSONIC FACILITY**
H. K. HOLMES (NASA, Langley Research Center, Hampton, VA) IEEE Aerospace and Electronic Systems Magazine (ISSN 0885-8985), vol. 1, Feb. 1986, p. 1-7.

The National Transonic Facility, NTF, is a high Reynolds Number facility where the increase in Reynolds Number is obtained by operating at high pressures and low temperatures. Liquid nitrogen is allowed to vaporize, making gaseous nitrogen the test medium with temperatures extending down to approximately 100 degrees Kelvin. These factors have created unique, new challenges to those developing sensors and instrumentation. Pressure vessels, thermal enclosures or elaborate temperature compensations schemes, are needed for environmental protection and special materials are needed for sensors and model fabrication. The need for a new measurement, model deformation, was also created. An extensive program to develop the unique sensors and instrumentation was initiated. The data acquisition system and systems to measure aerodynamic forces and pressures, model attitude, and model deformation, are discussed. Author

**THE MBB FLIGHT TEST CENTRE AND ITS FACILITIES**
K.-H. BURGER (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 11 p.
(AIAA PAPER 86-9746)

This paper gives a summarizing introduction of the Flight Test Center of the Messerschmitt-Boelkow-Blohm Company (MBB), as it presents itself today. Starting with flight test organization, management and worksharing, the test facilities and test ranges are described. Emphasis is laid on flight monitoring, computer systems for analyses, and development of analysis software which may be used on-line to some extent. In this field MBB is preparing itself especially for the flight test program of the future fighter aircraft of the German Air Force. Finally a review about conducted flight test programs is given. Author

**TRACKING RADARS AT FLIGHT TEST RANGES**
A. E. HOFFMANN-HEYDEN (RCA Missile Test Project, Patrick AFB, FL) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 10 p.
(AIAA PAPER 86-9747)

The paper reviews the evolution of operational tracking radars up to their current status, and their role in Test Range Instrumentation for measurements on flying targets. The major milestones of technical developments and the impact of digital computers are addressed and exemplified. Emphasis is placed on the use of computers to achieve enhanced radar performance and a host of auxiliary refinements and capabilities through software programs. Among these, sophistication and automation of calibration techniques increased the accuracy capabilities of high-quality radar systems for the benefit and consistency of metric data acquisition in the Test Range environment. Author

**AIR FORCE FLIGHT TEST CENTER RANGE OVERVIEW**
L. SMITH (USAF, Flight Test Center, Edwards AFB, CA) and E. RAMIREZ (USAF, Hill AFB, UT) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 6 p.
(AIAA PAPER 86-9748)

Over 75 percent of all Air Force Systems Command air vehicle testing is conducted at the Air Force Flight Test Center. In direct support of this activity are two instrumented ranges (the Air Force Flight Test Center and the Utah Test and Training Range) and a data acquisition and transmission corridor between them which stretches from Edwards AFB in southern California to Hill AFB in Utah. These terminal areas can function as separate entities or as a single range for extended flights. Data can be acquired in real-time in each area and by remote sites located along the microwave link between them. This paper addresses the Mission, Management, Resources and Future Plans for these ranges. Author

**COMPUTER GRAPHICS SUPPORT OF A NEW ERA IN FLIGHT TEST GROUND STATIONS**
P. T. VESELY (Grumman Corp., Grumman Data Systems, Alverton, NY) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 7 p.
(AIAA PPER 86-9769)

The use of computer graphics in the flight testing of aircraft is examined. The performance and display characteristics of the Megatek 7255 and the Tektronix 4115B graphic engines are evaluated and compared. The Megatek 8255 is a higher performance terminal; however, the Tektronix has superior resolution and visual display area. The components and functions of the failure status monitor which utilizes color graphics to display detected failures are described. The new display and control system uses the Tektronix to produce high quality displays; the real-time graphics provided by the system are discussed. The operation of the mission display subsystem which provides time, space, and positioning information is studied. A layout of a data analysis station is presented. I.F.

**A86-32135#**
**INTEGRATION TEST FACILITY FOR P3 AIRCRAFT PURPOSE AND USES**
G. E. BURGESS (Lockheed-California Co., Burbank) AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 8 p.
(AIAA PAPER 86-9807)

The P3 Integration Test Facility (ITF), geared towards both the integration of newly updated aircraft systems, and the functional testing and support of existing production equipment, is described. ITF Update III programs include an Acoustic Processor System for the P3C, and complete replacement of the acoustic sensor station equipment for active and passive sonar. Other ITF support functions include, satellite communications development for Satcom, program tape duplication, acoustic processing of real world data, and data link checkout of all production aircraft prior to delivery to the Navy. In addition to its avionics mock-up, the facility includes a development and demonstration facility incorporating an aircraft metal fuselage, consoles, and racks. Other ITF-type facilities are found in Canada and Japan. R.R.

The phenomenon of runway touchdown zone rubber buildup which is a potentially hazardous problem is discussed. The use of pavement surface texture measurements is capable of determining pavement friction levels. The use of four economical texture measurement techniques and their relationship to friction levels as determined by the Mu-Meter are discussed. Good correlations are obtained by relating pavement surface texture measurements of friction. However, predictive errors preclude the use of these models in lieu of friction measurements for use in rubber removal guidelines. E.A.K.

**RECENT IMPROVEMENTS TO THE NAE 5 FT. X 5 FT. BLOWDOWN WIND TUNNEL**
L. H. OHMAN, D. BROWN, A. J. BOWKER, and F. A. ELLIS
Aug. 1985 41 p
(AD-A162034; NAE-AN-31; NRC-24882) Avail: NTIS HC A03/MF A01 CSCL 14B

Although the National Aeronautical Establishment (NAE) 5 ft x 5 ft Blowdown Wind Tunnel was conceived in the 1950's, with commissioning in 1962/63, it has stood the test of time very well and is still, in 1985, in heavy demand. Three main reasons for this situation are: (1) the basic wind tunnel design was fundamentally very sound; (2) the wind tunnel circuit and its auxiliary systems have frequently been improved and modernized so that it, even today, is a modern up-to-date facility; and (3) the high level of competence of the supporting staff. This report presents the major improvements made in recent years and the impact these have had on the performance of the facility. The improvements are: the rebuild of the settling chamber; the rebuild of the exhaust diffuser; the installation of active Mach number control for subsonic transonic operation; The incorporation of dual drive on the two-dimensional insert balance system; the suppression of edgetone noise; The incorporation of highly accurate digital pressure transducers; and the control and data processing system. Future plans for expanded use of the wind tunnel are outlined. GRA

**INFORMATION ON AIRPORT AND AIRWAY TRUST FUND REVENUES AND OUTLAYS BY STATES AND LARGE AIRPORTS**
30 Sep. 1985 38 p
(PB86-129665; GAO/RCED-85-153; B-219969) Avail: NTIS HC A03/MF A01 CSCL 01A

The Airport and Airway Trust Fund was established to ensure that taxes collected from commercial air passengers, private pilots, and other sources are expended only for the expansion, improvement, and maintenance of the nation's air transportation system. Estimates by states and large airports of taxes paid into the trust fund are presented. Selected trust fund moneys received in fiscal years 1979 to 1983 are estimated. GAO's ability to fully estimate trust fund revenues and outlays by states and large airports was restricted by data limitations that required GAO to make several broad assumptions. The GAO notes that by law, the primary purpose of the trust fund is to ensure the safe operation of this nation's airspace system, not to provide an even or equitable return of the tax revenues to airports and states. B. SWEETMAN Interavia (ISSN 0020-5168), vol. 41, March 1986, p. 305-308.

A technology-readiness and performance prospects evaluation is made for next-generation large aircraft capable of reaching and sustaining hypersonic (Mach 5 and above) speeds with air breathing powerplants as well as of leaving the earth's atmosphere for Space Shuttle-like operations employing nonairbreathing propulsion. Both DARPA and NASA are currently sponsoring research in the materials, configuration design, propulsion and fuel systems, and control and navigation methods, that are entailed by such vehicles. Attention is given to cryogenically fueled 'air turboramjet' engine technology, which encompasses turbojet (low speed), ramjet (high speed), and rocket (exoatmospheric) propulsion cycles. O.C.

**REAL-TIME TELEMETERED INERTIAL GUIDANCE (TMIG) EVALUATION**
R. H. THOMPSON (USAF, Western Space and Missile Center, Vandenberg AFB, CA) and R. B. PICKETT (ITT, Vandenberg AFB, CA) AIAA, AHS, CASI, DGLR, TES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 4 p.
(AIAA PAPER 86-9795)

A primary safety problem of the National Test Ranges is related to the detection of, and response to, test vehicle failures which might pose an unacceptable risk to life and property. The inertial guidance (IG) system can accurately sense many types of potentially dangerous in-flight vehicle failures, and the data provided by it are routinely telemetered in real time. The evaluation of these data is discussed. The TMIG data is currently used as a secondary or backup source until late in the flight when the radar displays become noisy or unreliable. However, the reliance on radar data as the prime source for range safety displays leads to important questions in some scenarios. A discussion of these questions led to the formation of a special TMIG committee. The most important findings of the committee are summarized. G.R.

**FACTORS AFFECTING THE DESIGN OF MILITARY AIRCRAFT STRUCTURES IN CARBON FIBRE REINFORCED COMPOSITES**
B. W. ANDERSON (British Aerospace, PLC, Aircraft Group, Preston, England) IN: Advances in fracture research (Fracture 84). Volume 1 . Oxford and New York, Pergamon Press, 1986, p. 607-622.

Some of major factors and philosophies relating to the introduction of carbon fiber-reinforced epoxy matrices are reviewed. The basic rules governing the design of new laminate materials are discussed, including control tapering, blocking minimization, envelope tailoring, and reversible load buckling. Some of the structural limitations of laminates in design applications for military aircraft are also considered. These limitations include:

preprocessing and postprocessing variations from design standards; manufacturing and impact defects; notches due to loaded and unloaded holes; and environmental limitations with respect to temperature and moisture. Experimental data on the performance of carbon fiber reinforced composites in realistic military aircraft loading environments are given in an appendix. I.H.

### SPECTRUM FATIGUE CRACK GROWTH BEHAVIOR OF ALUMINUM ALLOYS

G. R. CHANANI, G. V. SCARICH, A. A. SHEINKER (Northrop Corp., Aircraft Div., Hawthorne, CA), and P. E. BRETZ (Aluminum Company of America, Alcoa Center, PA) IN: Advances in fracture research (Fracture 84). Volume 3 . Oxford and New York, Pergamon Press, 1986, p. 1609-1621. Navy-sponsored research. refs

Constant amplitude and spectrum fatigue crack growth testing was performed on ten commercial 2000 and 7000 series aluminum alloy plate materials. The materials were selected to determine the effects of various alloying approaches including purity (fracture toughness) and temper (yield strength). Two different fighter aircraft spectra were used for testing; one represented the loading on a lower wing root and had predominantly tension loads, and the other represented a horizontal tail hinge and had high magnitude compression loads. Spectrum fatigue crack growth life did not correlate with yield strength and only correlated weakly with fracture toughness. In addition, tests were performed with a modification of one of the spectra to determine the effects of compressive loads. These tests showed that compressive loads in this complex, random spectrum significantly reduced the life. Nevertheless, the ranking of the materials was essentially the same for all three spectra. ### FATIGUE CRACK PROPAGATION FROM AN INCLINED CRACK UNDER COMBINED MODE LOADING

R. CHINADURAI, B. K. JOSHI (Civil Aviation Department, New Delhi, India), and R. K. PANDEY (Indian Institute of Technology, New Delhi, India) IN: Advances in fracture research (Fracture 84). Volume 3 . Oxford and New York, Pergamon Press, 1986, p. 1703-1710. refs

The experiments conducted in the context of the present study involved the employment of aluminum alloy and steel which are utilized as structural materials in aircraft. Attention is given to details of fatigue testing and evaluation, the fatigue crack growth profile and the crack propagation direction, the determination of the crack growth rate, the fatigue crack growth rate as a function of various parameters, the effect of crack angle and stress level on the cyclic life, the crack propagation angle, and a comparison of experimental and theoretical crack growth rates. It is found that the average direction of fatigue crack growth is independent of crack size and stress amplitude. G.R.

### FATIGUE BEHAVIOUR OF ADVANCED ALUMINIUM ALLOY LUGS OF 7475-T761 WITH AND WITHOUT INITIAL CRACKS

A. BUCH and A. BERKOVITS (Technion - Israel Institute of Technology, Haifa) IN: Advances in fracture research (Fracture 84). Volume 3 . Oxford and New York, Pergamon Press, 1986, p. 1983-1989. refs

7475 and 2024 Al-alloy lugs were tested under various test conditions. Spectrum and constant-amplitude tests showed that the total life of undamaged lugs of 7475-T761 aluminium alloy was not longer than that of conventional materials. This was probably because of the equally damaging effect of fretting in all materials compared. In the case of maneuver loading spectrum the crack propagation life of lugs with initial cracks was larger for the 7475-T761 lugs than for similar lugs made of 2024-T3. Author

### MATERIALS AND PROCESSES; PROCEEDINGS OF THE FIFTH TECHNOLOGY CONFERENCE, MONTREUX, SWITZERLAND, JUNE 12-14, 1984. VOLUMES 1&2

Conference sponsored by the Society for the Advancement of Material and Process Engineering. Geneva, Switzerland, Society for the Advancement of Material and Process Engineering, 1985. Vol. 1, 185 p.; vol. 2, 191 p. No individual items are abstracted in these volumes.

The present conference on advanced aerospace materials gives attention to high performance thermoplastic matrix composites and their manufacturing techniques, the filament winding of complex components, the mechanized manufacture of FRP components for aircraft secondary structures, a novel high strain-to-failure prepreg, the manufacture of accurate glass and carbon fiber preforms for resin injection, a helicopter composite tail unit, Al-Li alloys, the durability of Arall, the potential weight savings obtainable in future transport aircraft through the use of advanced materials, superplastically formed Ti and Al alloys for aerospace applications, and assembly bonding with room temperature-curing adhesives. Also discussed are novel composite systems for use in primary aircraft structures, accelerated moisture absorption in carbon-epoxy, the thermoanalytic characterization of matrix resins and composites, the definition of microstructures in hybrid reinforced plastics, ceramic components for automotive powerplants, Kevlar-reinforced automotive components, metallized textile fabrics and their applications, and the role of S-2 glass fibers in advanced composites. O.C.

### MULTIPURPOSE CORROSION INHIBITORS FOR AEROSPACE ALLOYS IN NAVAL ENVIRONMENTS

V. S. AGARWALA (U.S. Navy, Naval Air Development Center, Warminster, PA) IN: New materials and new processes. Volume 3. 1985 . Cleveland, OH, JEC Press, Inc., 1985, p. 178-189. refs

Principles of corrosion and corrosion control applicable to crack tips were considered to evolve a new approach for the inhibition of cracking in high strength steels and aluminum alloys. Chemical systems were formulated with multifunctional properties such that a synergistically combined inhibitor system could modify, in situ the interfacial chemistry of the crack. Laboratory experiments were conducted to investigate the effects of such inhibitors on stress corrosion cracking and corrosion fatigue behavior of 4340 and 300M steels and 7075-T6 aluminum alloy. The inhibitor system 'DNBM' showed a significant effect in retarding crack growth rate in the alloys tested and also enhanced the threshold, K(1scc), for the aluminum alloy. The most promising application for the multifunctional concept has proven to be a chemical conversion coating for aluminum alloys. Author

**ACOUSTIC-BACKSCATTERING STUDIES OF TRANSVERSE CRACKS IN COMPOSITE THICK LAMINATES**

B. B. RAJU (Dayton, University, OH) Experimental Mechanics (ISSN 0014-4851), vol. 26, March 1986, p. 71-78. refs

(Contract F33615-83-5036)

The distribution of first-ply transverse cracks in graphite/epoxy 0.5-in. thick laminates was scanned by the acoustic-backscattering technique. The backscattering scans reveal a discrete number of characteristic dark bands in the case of specimens subjected to static loads or a low number of fatigue-load cycles. A dark band extending along the length of the specimen was obtained in specimens subjected to a high number of fatigue-load cycles. These dark bands reveal the three-dimensional distribution of transverse cracks situated in several adjacent planes. X-ray radiography shows the projection of the three-dimensional distribution of transverse cracks in the laminate plane and hence it may provide a low estimate of the distribution of transverse cracks in composite thick specimens. **THE DEVELOPMENT OF ALUMINUM-LITHIUM ALLOYS FOR AEROSPACE APPLICATIONS**

A. J. CORNISH, A. GRAY, W. S. MILLER, and M. A. REYNOLDS *In* ESA Proceedings of 3rd European Symposium on Spacecraft Materials in Space Environment p 195-201 Nov. 1985 refs

Avail: NTIS HC A13/MF A01

The development of aluminum-lithium based alloys is described by considering the reasons for the rapid growth of interest in the alloy type, the property targets sought, the compositions on which the major effort is concentrated, the properties achieved, and manufacturing. The objective is to achieve a 10% reduction in density relative to standard high strength alloys, together with a 10% increase in stiffness, while matching the strength and other service properties associated with the standard alloys. Two aluminum-lithium based alloys are under development to match the service properties of alloys in the 2000 and 7000 series. One alloy is used in different tempers, either to match the properties of the medium strength alloy 2014 T6 or to give a low density replacement for the damage tolerant alloy 2024 T3. The second has a higher strength and matches the properties of 7075 T6. Author (ESA)

**INTERACTIONS BETWEEN FLOW, HEAT AND MASS TRANSFER DURING FORMATION OF CARBON-FIBER REINFORCED EPOXY COMPOSITES Ph.D. Thesis**

Y. S. WANG 1985 174 p

Avail: Univ. Microfilms Order No. DA852482

Reinforced epoxy composites that contain long carbon fibers have shown strength and durability when used in aircraft secondary structures. The curing process of epoxy composites is complex. The polymerization reaction, heat and mass transfer, and flow have to be analyzed simultaneously. The interaction of cure kinetics, chemo-rheology, heat and mass transfer, and flow consolidation is concerned. The pregelation cure kinetics was described in terms of the overall reaction rate parameters and heat of polymerization using differential scanning calorimeter techniques. Viscosity measurements of the epoxy resin as a function of time at constant temperature were made at Lockheed Company and were combined with the kinetic data. The simultaneous heat and mass transfer was modeled mathematically. The density and thermophysical properties of the curing prepreg such as specific heat and thermal diffusivity were measured. Experiments were done with practical composite, simulated composite and also a macroscopic system to study the flow phenomena. Dissert. Abstr.

**THERMAL BARRIER COATING LIFE PREDICTION MODEL DEVELOPMENT Annual Report**

K. D. SHEFFLER and J. T. DEMASI Nov. 1985 92 p refs

(Contract NAS3-23944)

(NASA-CR-175087; NAS 1.26:175087; AR-1) Avail: NTIS HC A05/MF A01 CSCL 11G

A methodology was established to predict thermal barrier coating life in an environment simulative of that experienced by gas turbine airfoils. Specifically, work is being conducted to determine failure modes of thermal barrier coatings in the aircraft engine environment. Analytical studies coupled with appropriate physical and mechanical property determinations are being employed to derive coating life prediction model(s) on the important failure mode(s). An initial review of experimental and flight service components indicates that the predominant mode of TBC failure involves thermomechanical spallation of the ceramic coating layer. This ceramic spallation involves the formation of a dominant crack in the ceramic coating parallel to and closely adjacent to the metal-ceramic interface. Initial results from a laboratory test program designed to study the influence of various driving forces such as temperature, thermal cycle frequency, environment, and coating thickness, on ceramic coating spalling life suggest that bond coat oxidation damage at the metal-ceramic interface contributes significantly to thermomechanical cracking in the ceramic layer. Low cycle rate furnace testing in air and in argon clearly shows a dramatic increase of spalling life in the non-oxidizing environments. Author

**FLEXURAL PROPERTIES OF CARBON FIBRE CLOTH/WOOD VENEER LAMINATES**

J. H. SEWELL Apr. 1985 23 p

(AD-A161921; RAE-TM-MAT-STR-1055; DRIC-BR-96647) Avail: NTIS HC A02/MF A01 CSCL 11E

Flexural tests have been made on epoxy or phenolic resin bonded hybrid laminates comprising carbon fiber cloth layers on wood veneer cores. Breaking loads and stiffnesses of many of the hybrids exceed those of all carbon fiber cloth laminates of the same weight per unit area of panel. This improvement in flexural properties can be accompanied by a significant decrease in materials costs owing to the replacement of expensive carbon fiber cloth by cheap wood veneers. Significant weight savings may be achieved if carbon fiber laminates are replaced by hybrid laminates having the same flexural breaking strengths or stiffnesses. GRA

**COMPARISON OF ALUMINUM ALLOYS CONCERNING STRENGTH AND DAMAGE TOLERANCE**

L. SCHWARMANN 21 Aug. 1985 21 p refs

(MBB-UT-111/85; REPT-TE-374/0723/85) Avail: NTIS HC A02/MF A01

The static strength, crack growth, and residual strength of high strength aluminum alloys used in aircraft engineering were investigated using approved material data. Alloys having high static strengths show worse crack growth and residual strength behavior compared with alloys having lower static strengths. The 2024-materials show the best crack growth behavior. The 7475-materials show the best residual strength behavior. Heat-treatment influences the crack growth and strength behavior significantly. Product form does not influence crack growth and strength behavior. The casting material A 357 T6 shows nearly the same crack growth behavior as the plate material 2024-T351, but shows worse strength behavior as compared with all other materials considered. ### A PERIPHERAL INTEGRATED SYSTEM STATUS DISPLAY - FIGURAL GOODNESS OR PROXIMITY EFFECTS?

D. B. BERINGER (Wisconsin, University, Madison) IN: Symposium on Aviation Psychology, 3rd, Columbus, OH, April 22-25, 1985, Proceedings . Columbus, OH, Ohio State University, 1985, p. 183-187.

Certain problems arising in connection with peripheral or secondary displays are examined. Secondary display systems usually require additional visual scanning beyond the primary displays for system control. These secondary devices generally require the diversion of attention from primary displays used for flight control. The occurring lapses in primary task performance may contribute to a degradation in system performance. Such a degradation can be especially threatening in aviation systems used by commercial carriers. Attention is, therefore, given to alternate means of information display and their underlying desired qualities. 'Figural' displays are considered along with integrated displays, the present application used for experimentation, and the experimental examination of the display. The evaluated results suggest that the use of an integrated analog display allowing some shape or figural processing can be beneficial. G.R.

### UNIFIED APPROACH FOR MODELLING FATIGUE CRACK GROWTH AND SOME OBSERVATIONS ON BEHAVIOUR UNDER FLIGHT SIMULATION LOADING

K. N. RAJU and R. SUNDER (National Aeronautical Laboratory, Bangalore, India) IN: Advances in fracture research (Fracture 84). Volume 1 . Oxford and New York, Pergamon Press, 1986, p. 57-81. refs

The status of theories on fatigue crack growth under constant and variable amplitude loading is briefly reviewed. A unified model incorporating the concepts of energy balance, damage, and the phenomenon of crack closure is described in detail. The crack growth rate relation derived from the model is found to account for the effects of a number of parameters such as fracture toughness, stress ratio threshold thickness, and non-LEFM conditions. The damage concept used in the model makes it possible to determine the effects of environmental factors on crack growth rates, including rainfall counting to fatigue crack growth. Some problems encountered in extrapolating crack growth test data on the basis of simple laboratory specimens under flight simulation loading to predict crack growth in structures are examined. I.H.

**A86-29961**

### PROBABILISTIC FATIGUE AND FRACTURE DESIGN

A. O. PAYNE (Royal Melbourne Institute of Technology, Australia) IN: Advances in fracture research (Fracture 84). Volume 1 . Oxford and New York, Pergamon Press, 1986, p. 339-376. refs

A probabilistic approach to ultimate load failure and failure analysis under a wear-out process (due to fatigue or corrosion) is discussed. The approach is used to construct a theoretical model of structural behavior which makes it possible to evaluate the risks of ultimate load failure and failure in specific wear-out conditions. The probabilisitc procedure is illustrated by three examples including: (1) safety-by-inspection of a high strength steel aircraft structure with initial defects included; (2) design optimization for a semisubmersible drilling rig subject to corrosion; (3) and preliminary risk analysis for fatigue and fracture of a welded aluminum alloy road tanker. From a consideration of safety standards in various engineering design fields, the optimum probability of failure due to wear out processes should be less than 10 to the -4th p.a., and is insignificant at 10 to the -7th p.a. I.H.

### VARIATION OF EFFECTIVE STRESS RANGE RATIO UNDER SIMPLE VARIABLE AMPLITUDE LOADING

S. CHAND and S. B. L. GARG (M. N. R. Engineering College, Allahabad, India) IN: Advances in fracture research (Fracture 84). Volume 3 . Oxford and New York, Pergamon Press, 1986, p. 1711-1718. refs

It is pointed out that in space vehicles and aircraft structures loading conditions in service are often complex. A number of crack propagation experiments involving different load patterns are reported. Attention is given to the experimental procedure, the development of U-models, an intermediate single Peak High Load Cycle (PHLC) in a Constant Amplitude Load (CAL) test, Hi-Lo load sequence tests and decrease in mean load sequence tests, an intermediate multi-PHLC applied in a CAL-test, and a comparison of Crack Growth Rate (CGR) model results with experimental results. G.R.

**A86-30019**

### FATIGUE OF STRUCTURAL MATERIALS AT HIGH-FREQUENCY CYCLE LOADING

V. A. KUZMENKO (AN USSR, Institut Problem Prochnosti, Kiev, Ukrainian SSR) IN: Advances in fracture research (Fracture 84). Volume 3 . Oxford and New York, Pergamon Press, 1986, p. 1791-1798. refs

The operating conditions of many devices of modern technology can produce intensive periodic or random vibrations at high sonic or ultrasonic frequencies, taking into account gas turbine blades, and elements in other aircraft components. These vibrations can become the reason for fatigue fracture. On account of the importance of these phenomena, studies have been conducted of high-frequency cyclic loading (HFCL) fatigue and low-frequency cyclic loading (LFCL) fatigue. Attention is given to the cyclic loading frequency effect on the endurance limit of different materials, and the cyclic loading frequency effect on the fatigue crack growth rate. It is found that the difference between the fatigue characteristics due to different loading frequencies contributes to the increase in the safety factor and, consequently, to an enhancement in the component lifetime. G.R.

### SHORT CRACK DEVELOPMENT IN MECHANICAL STRUCTURES

J. NEMEC (Ceskoslovenska Akademie Ved, Ustav Teoreticke a Aplikovane Mechaniky, Prague, Czechoslovakia) and J. DREXLER (Vyzkumny a Zkusebni Letecky Ustav, Prague, Czechoslovakia) IN: Advances in fracture research (Fracture 84). Volume 3 . Oxford and New York, Pergamon Press, 1986, p. 1919-1925.

The physical background of short crack development is discussed, taking into account differences between the results provided by theoretical models and experimental findings. Differences between simplified models and real structures are found to be so pronounced that the applicability of both linear fracture mechanics and theoretical fracture mechanics is limited to developed macrocracks. Short crack systems in aircraft turbine disks are considered, giving attention to questions of basic importance in the solution of operational reliability problems, a statistical analysis concerning the problem of finding a representative description of the state of a structure, and a formula providing an acceptable lifetime estimation in the case of a short crack system for airworthiness requirements. G.R.

### FRACTOGRAPHIC STUDY OF FATIGUE CRACK KINETICS IN BODIES AND STRUCTURES

I. NEDBAL, J. SIEGL, and J. KUNZ (Ceske Vysoke Uceni Technicke, Prague, Czechoslovakia) IN: Advances in fracture research (Fracture 84). Volume 3 . Oxford and New York, Pergamon Press, 1986, p. 2033-2040. refs

Some quantitative fractographic analysis methods are outlined which can reveal the macroscopic characteristics of fatigue crack growth. Fractographic data related to crack length are transformed into a description of the fatigue process over time. This fractographic reconstruction of the kinetics of fatigue failure can yield information on failure processes in large-scale structures which are so far unavailable by other means. The results that can be obtained are demonstrated using two case studies of fatigue failure in aircraft structures. C.D.

### DURABILITY AND DAMAGE-TOLERANCE DESIGN AND ANALYSIS OF TITANIUM AIRFRAME STRUCTURES

J. B. CHANG (Rockwell International Corp., Los Angeles, CA) IN: Advances in fracture research (Fracture 84). Volume 5 . Oxford and New York, Pergamon Press, 1986, p. 3507-3516. refs

Durability and damage-tolerance requirements and analysis methodologies for Ti primary airframe structures of aircraft systems are described. Durability and damage-tolerance assessments are performed with an automated fatigue crack growth analysis computer code CRKGRO. The CRKGRO calculation of crack growth in cyclic-loaded structures, which is based on linear elastic fracture mechanics, is analyzed. The use of Gallagher's (1974) Willenborg retardation model and the Chang acceleration scheme of Chang et al. (1981) to develop a load interaction model is discussed. The Vroman linear approximation method of Chang et al. (1980) is the damage accumulation scheme for the computer program. The procedure for residual strength analysis is studied. The durability analysis methodology which evaluates the economic life of the structural components of an advanced aircraft is examined. An example of the durability and damage-tolerance analyses of the lower cover of a wing carry-through structure is provided. I.F.

### FATIGUE CRACK GROWTH IN PATCHED PLATES UNDER CONSTANT AMPLITUDE AND FLIGHT SIMULATION LOADINGS

R. CHANDRA and R. SUNDER (National Aeronautical Laboratory, Bangalore, India) IN: Advances in fracture research (Fracture 84). Volume 5 . Oxford and New York, Pergamon Press, 1986, p. 3523-3531. Research supported by the Aeronautics Research and Development Board. refs

Fatigue crack propagation was studied in aluminium alloy plates reinforced by adhesive bonding a unidirectional carbon fibre epoxy patch across the crack path. The tests were carried out under constant amplitude as well as flight simulation combat aircraft spectrum loading. Comparative tests were also conducted on unpatched plates. The composite patch considerably reduces crack growth rates. The improvement in resistance to fatigue crack growth is more pronounced under spectrum loading conditions. Author

### FAST MOTION SIMULATION

F.-X. DOITTAU, J. R. HURIET, and M. TISSOT (Societe Anonyme d'Etudes et Realisations Nucleaires, Limeil-Brevannes, France) IN: 1985 Summer Computer Simulation Conference, Chicago, IL, July 22-24, 1985, Proceedings . San Diego, CA, Society for Computer Simulation, 1985, p. 727-731.

The Sodern Visualization System (SVS) is a high luminous output video projector which modulates the light using Titus light-valves. These light-valves utilize a solid crystal dielectric target (deuterated potassium diacid phosphate) on which the electrical charge density is controlled by a scanned electron beam. The resulting voltage difference between the two crystal sides induces a proportional optical birefringence which is employed to modulate the polarization of light. The main characteristics of the SVS are discussed, and the influence of light-valve parameters and image source is examined. Attention is given to the light-valve parameters, image source characteristics, the image motion ratio, and the moving images displayed using the SVS. G.R.

### OPTIMAL SIZING OF COMPOSITE POWER TRANSMISSION SHAFTING

J. W. LIM (Maryland, University, College Park) and M. S. DARLOW (Rensselaer Polytechnic Institute, Troy, NY) American Helicopter Society, Journal (ISSN 0002-8711), vol. 31, Jan. 1986, p. 75-83. refs

(Contract DAAG29-82-K-0093)

The optimal design of composite drive shafting is developed with the goal of minimizing system weight. The study is illustrated with an application to a composite tail rotor drive shaft for advanced helicopters. It is also applicable to the design of composite synchronization drive shafts for helicopters and other composite shafts for aircraft, spacecraft and automobiles. The use and effectiveness of the optimal design procedure are demonstrated with an illustrative example. In the example, an optimized Graphite/Epoxy (G/E) T300/5208 tail rotor drive shaft with a single tube operating supercritically at 6000 RPM reduces system weight by as much as 63.1 percent compared to a conventional aluminum alloy tail rotor drive shaft system. Even constrained to subcritical operation, an optimized G/E (T300/5208) drive shaft with three tubes at 6000 RPM reduces system weight by as much as 38.1 percent. By comparison, simply replacing the five aluminum shaft sections with G/E (T300/5208) composite tubes operating at 5000 RPM results in a system weight reduction of, at best, only 15.3 percent. ### CALCULATION OF RECIRCULATING FLOW BEHIND FLAME-HOLDERS

Q. ZENG, Y. SHENG, and Q. ZHOU (Nanjing Aeronautical Institute, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Oct. 1985, p. 495-497. In Chinese, with abstract in English. refs

Adoptability of standard K-epsilon turbulence model for numerical calculation of recirculating flow is discussed. Many computations of recirculating flows behind bluff-bodies used as flame-holders in afterburner of aeroengine have been completed. Blocking-off method to treat the incline walls of the flame-holder gives good results. In isothermal recirculating flows the flame-holder wall is assumed to be isolated. Therefore, it is possible to remove the inactive zone from the calculation domain in programming to save computer time. The computation for a V-shaped flame-holder exhibits an interesting phenomenon that the recirculation zone extends to the cavity of the flame-holder. Author

### A STRESS INTENSITY FACTOR SOLUTION DUE TO HOLES AHEAD OF GROWING CRACKS IN THIN SHEET MATERIAL

J. B. YOUNG and P. N. CAMPBELL (Cranfield Institute of Technology, England) Aeronautical Journal (ISSN 0001-9240), vol. 90, Jan. 1986, p. 1-5. refs

The variation of the Crack Stress Intensity Factor (SIF), for two cracks growing from one hole only in an array of holes in an isotropic material under uni-axial tension has been studied. The effect of the fastener hole ahead of the growing crack was found to give an increase in the SIF only when the crack was within about one and a half diameters of the approached hole edge, compared with the level predicted by considering a single central hole in a plate. An equation suitable for inclusion in a crack growth program has been derived from the research results. Author

**AEROSPACE AND ELECTRONIC SYSTEMS - ADVANCED CONCEPTS AND PIONEERING PERSPECTIVES; PROCEEDINGS OF THE SIXTH SYMPOSIUM, DAYTON, OH, NOVEMBER 14, 15, 1984**

Symposium sponsored by IEEE. New York, Institute of Electrical and Electronics Engineers, 1984, 116 p. No individual items are abstracted in this volume.

Among the topics discussed are: the PRAM approach to technology transfer; all-electric aircraft development; and electronic enhancements for the combat aircraft cockpit. Consideration is also given to application of AI systems to military aircraft; ECM and ECCM technology; and the history of monolithic ICs. Developments in the USAF Avionics Integrity Program (AVIP) are reviewed, with emphasis given to: preventive measures for electrostatic discharges; corrosion prevention to increase avionics integrity; and criteria for stress screening temperature levels. I.H.

**SECTAM XII - PROCEEDINGS OF THE TWELFTH SOUTHEASTERN CONFERENCE ON THEORETICAL AND APPLIED MECHANICS, PINE MOUNTAIN, GA, MAY 10, 11, 1984. VOLUME 1**

Auburn, AL, Auburn University, 1984, 615 p. No individual items are abstracted in this volume.

Turbulence-related investigations are discussed, taking into account the formulation of three-dimensional boundary-layer equations for viscid/inviscid interacting flow, a theory for generating turbulent flow, numerical experiments in open-channel turbulence, the application of the K-E turbulence model to a boundary layer solution for flow about a spinning yawed projectile at Mach 3, and the simulation of late transition in plane channel flow. Other topics explored are related to wave propagation, nonlinear structural dynamics, computational methods, geomechanics, continuum mechanics, experimental methods, fluid mechanics, biofluid mechanics, vibrations of plates and shells, composite materials, fracture mechanics, interdisciplinary/applied problems, hydraulics, fluid-structure interaction, solid mechanics, and the theory of shells. Attention is given to an analysis of a superplastically formed and diffusion bonded sandwich panel, the composite repair of a cracked aluminum alloy aircraft structure, and the determination of turbomachinery blade characteristics for vibration analysis. G.R.

**A86-31259**

**SECTAM XII - PROCEEDINGS OF THE TWELFTH SOUTHEASTERN CONFERENCE ON THEORETICAL AND APPLIED MECHANICS, PINE MOUNTAIN, GA, MAY 10, 11, 1984. VOLUME 2**

Auburn, AL, Auburn University, 1984, 586 p. No individual items are abstracted in this volume.

Subjects in the area of fluid mechanics are discussed, taking into account heat-up flows of a contained fluid, an analytical solution for natural convection in a vertical oriented porous annulus, the Weissenberg effect generated by a torsionally oscillating rod in a layered medium, a system analysis for a model of bluff body base flow, steady solutions of the shallow water equations, and the subsonic near-wake of an axisymmetric body with a slanted base. Computational methods are considered along with structural vibrations, structural stability, experimental methods, coastal hydrodynamics, dynamical systems, large space structural systems, the hydraulics of sediment transport, localization of deformation, wave propagation, vibrations of plates and shells, composite materials, and design studies. Attention is given to damage tolerance studies in operational aircraft, design verification testing of advanced prototype structures, continuous filament wound grid stiffened composite structures for aircraft fuselages, and Navier-Stokes solutions for two-dimensional subsonic base flow. G.R.

**SUPERSONIC INTERFACE INSTABILITIES OF ACCELERATED SURFACES AND JETS**

C. L. GARDNER (New York University, NY) Physics of Fluids (ISSN 0031-9171), vol. 29, March 1986, p. 690-695. refs
(Contract DE-AC02-76ER-03077)

The compressible Rayleigh-Taylor instability of a supersonic accelerated contact discontinuity between two gases is studied by numerically solving the two-dimensional Euler equations. The computed solutions exhibit a complicated set of nonlinear waves comprised of spike and bubble bow shocks, terminal shocks within the spike and bubble, Kelvin-Helmholtz rollup of the spike tip, and contact surface waves. The spike appears to attain a finite growth of aspect ratio approximately equal to 2. The propagation of a supersonic slab jet is also studied numerically, in order to compare and contrast the jet wave structure with that of the supersonic accelerated surface. Author

**PLASTIC TORSION OF HOLLOW ELEMENTS OF AIRCRAFT [PLASTICHESKOE KRUCHENIE POLYKH ELEMENTOV LETATEL'NYKH APPARATOV]**

IU. P. KATAEV Moscow, Izdatel'stvo Mashinostroenie, 1985, 128 p. In Russian. refs

Engineering methods are presented for calculating the plastic torsion parameters of hollow elements of aerodynamic cross-sectional shape whose thickness varies along the contour length. Methods are also presented for calculating the stress-strain state of hollow elements of aircraft under loading and unloading for varying twist angle and force parameters. The discussion also covers automatic control of the torsion of such aircraft components as the spars of helicopter rotor blades and problems related to dynamic plastic torsion. V.L.

**A GENERAL CRITERION IN DESIGN [K VOPROSU OB OBSHCHEM KRITERII V PROEKTIROVANII]**

IU. A. KOZLOV, V. N. NOSIK, and A. F. PROTSENKO Samoletostroenie - Tekhnika Vozdushnogo Flota (ISSN 0581-4634), no. 51, 1984, p. 31-35. In Russian.

A criterial approach to the design process and to the qualitative evaluation of the designed components is examined with particular reference to aircraft design applications. It is shown that the criterial concept of the development of a design idea and its evaluation at all stages of the development enable a quantitative expression of elements of an interrelated system of criteria and a transition to the general assessment of the quality of the product at each stage. V.L.

**A MATHEMATICAL MODEL FOR STRUCTURES CONSISTING OF ELASTIC SHELL SECTIONS CONNECTED BY OPEN GIRDERS [MATHEMATICHESKAIA MODEL' KONSTRUKTSII, SOSTOIASHCHIKH IZ UPRUGIKH OTSEKOV OBOLOCHEK, SOEDINENNYKH OTKRYTYMI FERMAMI]**

N. M. KHARUN Samoletostroenie - Tekhnika Vozdushnogo Flota (ISSN 0581-4634), no. 51, 1984, p. 83-88. In Russian.

A method is proposed for developing a mathematical model describing the stress-strain state of structures consisting of thin-walled discretely reinforced shell sections connected by open girders. The model proposed here is based on the theory of composite systems and is particularly relevant to the design of load-bearing aircraft structures. V.L.

**A86-31773**

**FREE VIBRATION CHARACTERISTICS OF PERIODICALLY STIFFENED PANELS WITH DAMPED STRINGERS**

B. V. R. GUPTA (Andhra University, Waltair, India), S. NARAYANAN, and N. GANESAN (Indian Institute of Technology, Madras, India) Journal of Sound and Vibration (ISSN 0022-460X), vol. 105, March 8, 1986, p. 351-356.

It is shown that constrained damping treatment on the flanges of the stiffener of a periodic sheet-stringer panel provides less overall damping than unconstrained damping treatment on the flanges. The resonant frequencies are observed to increase. This type of treatment is also shown to give maximum damping for frequencies corresponding to the stringer torsion mode and minimum damping for the stringer bending mode in the plane of symmetry. In all cases, these trends are the same as those found for unconstrained damping treatment by Narayanan, Gupta, and Ganesan (1984). C.D.

**RADIO COMMUNICATION BETWEEN MANOEUVRING PLATFORMS**

G. W. MILLWARD (British Aerospace, PLC, Dynamics Group, Bristol, England) IN: International Conference on Antennas and Propagation (ICAP 85), 4th, Coventry, England, April 16-19, 1985, Proceedings . London and New York, Institution of Electrical Engineers, 1985, p. 343-347. refs

A method for deriving the probability distribution of the link margin is proposed. The effects of attitude on antenna gain and cross-polarization loss are examined. The relative distribution of energy between the specular and diffuse reflections of the multipath signals is determined by the roughness of the terrain, grazing angle, and transmission frequency. The relation between the absorption coefficient and height, water vapor content, the earth's curvature, and refraction is discussed. Platform height, maneuver, and velocity, which influence multipath propagation and antenna gain, are studied. An example in which the probability distribution of link margin is calculated for a short range ground-to-air system for a single aircraft is provided. I.F.

**ADVANCES IN DISPLAY TECHNOLOGY V; PROCEEDINGS OF THE MEETING, LOS ANGELES, CA, JANUARY 24, 25, 1985**

E. SCHLAM, ED. (U.S. Army, Electronic Technology and Devices Laboratory, Fort Monmouth, NJ) Meeting sponsored by SPIE - The International Society for Optical Engineering. Bellingham, WA, SPIE - The International Society for Optical Engineering (SPIE Proceedings. Volume 526), 1985, 124 p. For individual items see A86-32315 to A86-32323.

(SPIE-526)

Display human factors, and various advanced display systems, including CRT and projection display systems, electroluminescent displays, and passive displays, are discussed. Papers are presented on the selection of the best visual system, the effects of adaptation and display luminance on CRT symbol recognition time, and minimum color differences required to recognize small objects on a color CRT. Consideration is given to such display systems as a 160 megapixels per second 2000 line display, a full color liquid crystal light valve projector, and a thin film electroluminescent display optimized for cockpit application. Papers on passive displays include those on amorphous silicon thin film transistor-driven liquid crystal displays, a display based on switchable zero-order diffraction grating valves, and a liquid crystal display system for mass audience viewing. I.S.

**160 MEGAPIXELS PER SECOND 2000 LINE DISPLAY**

J. A. MAYS (Electronic Image Systems, Inc., Xenia, OH) IN: Advances in display technology V; Proceedings of the Meeting, Los Angeles, CA, January 24, 25, 1985 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1985, p. 43-50.

A program to develop a 2048-by-2048 pixel display is described. Key technical limits are identified, and a R&D program to advance the state-of-the-art by constructing a monochrome and color feasibility model display is discussed. The paper will concentrate on the CRTs, the 160-megapixels/sec video circuitry, and the deflection systems developed for the two feasibility model displays. Author

**DEVELOPMENT OF A RASTER/STROKE FULL-COLOR TV PROJECTOR FOR SIMULATION**

E. F. GENAW (Systems Research Laboratories, Inc., Dayton, OH) IN: Advances in display technology V; Proceedings of the Meeting, Los Angeles, CA, January 24, 25, 1985 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1985, p. 59-66.

Advances in the simulation industry in Computer Image Generation (CIG) systems and the desire to go to very wide fields of view have created a need for advances in display technology. Hybrid CIG, combining sometimes conflicting raster and stroke (calligraphic) technologies, has furthered the need for advancement. This paper describes some of the challenges and solutions encountered in the production of a projector which fulfills these needs. Problems associated with off-axis projection, convergence, and dynamic spot size control are discussed. Author

**A86-32321**

**THIN FILM ELECTROLUMINESCENT (TFEL) DISPLAY OPTIMIZED FOR COCKPIT APPLICATIONS**

G. L. VICK, W. G. RUNYAN, R. F. COLTON, R. J. THORKILDSON, and J. S. TRCKA (Rockwell International Corp., Avionics Group, Cedar Rapids, IA) IN: Advances in display technology V; Proceedings of the Meeting, Los Angeles, CA, January 24, 25, 1985 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1985, p. 71-74.

A thin film electroluminescent flat panel display, developed specifically for the aircraft cockpit is described. The film is a sandwich of Mn-doped ZnS between two layers of Y2O3. The features of the electrical drive, and an optical band pass filter are presented, and the problems of increasing light output from the display, reducing reflections, and enhancing contrast are discussed. Performance data on two sample displays are included. I.S.

**EFFECT OF RADAR FREQUENCY ON THE DETECTION OF SHAPED (LOW RCS) TARGETS**

D. MORAITIS and S. ALLAND (Hughes Aircraft Co., Culver City, CA) IN: International Radar Conference, Arlington, VA, May 6-9, 1985, Record . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 159-162. refs

The use of shaping to reduce the radar cross-section (RCS) of aircraft and missiles can result in the RCS varying significantly with radar operating frequency. This RCS sensitivity to frequency should be considered when selecting radar frequency and should be accounted for when evaluating radar performance. A detection range increase for shaped (low RCS) targets of a factor of two or greater can be realized for lower frequency radar (e.g., UHF-Band or L-Band) when compared to higher frequency radar (C-Band or X-Band). For low flying (sea skimming) targets, the RCS variation with frequency for shaped (low RCS) targets neutralizes the advantage that higher radar frequencies realize in multipath propagation resulting in approximately the same detection range across the radar bands from UHF to X-Band. Author
